OUR weekly market reviews of the past two years have made frequent mention of the higher rate at which steel plants in the Chicago district were operating, in comparison with those of the Pittsburgh and Youngstown districts. The statistical report of the American Iron and Steel Institute for 1927, issued this week, gives confirmation of these general statements and to some extent permits a statistical measure of the shift in steel production that has come since the abolition of Pittsburgh Plus. One of the tables gives the production of steel ingots by States, showing the output for 1927 in percentage of capacity at the beginning of the year. The average for the country was 75.48 per cent. Of the large producing States, two ran above this and three below, as follows:

	Per Cent
Indiana	88.03
Ohio	77.28
Illinois	73.97
Pennsylvania	71.52
New York	71.48

The smaller States cannot be referred to, as some of them are grouped together. However, State totals of steel ingots and castings combined are given, with very little bracketing, while there are separate tables for the Youngstown district and for Allegheny county, and the comparison can be pursued along that line. Total production of steel ingots and castings decreased almost 7 per cent from 1926 to 1927, but one observes that while Indiana (Gary and Indiana Harbor) lost only 1.8 per cent and Illinois only 4.2 per cent, the Youngstown district went down 11.7 per cent and Allegheny

county 11.0 per cent. West Virginia made the divergent showing of decreasing 8.9 per cent from 1925 to 1926, when the industry as a whole gained, and then increasing from 1926 to 1927 by 12.4 per cent, the cause of the decrease being presumably the abandonment of the Riverside plant of the National Tube Co., while one cause of the increase was the growth of the Weirton Steel Co.

Pennsylvania is the big State in ingot capacity, Ohio coming next but with less than two-thirds as much as Pennsylvania, while Indiana and Illinois combined do not equal Ohio. Comparisons by States, however, have limited value, for Pennsylvania has steel spread over almost its entire length, while Illinois and Indiana have steel only in one corner. In sequence the million-ton States in ingot capacity (representing nearly 93 per cent of the total) are as follows:

Pennsylvania ...	21,976,636	New York.....	2,819,350
Ohio	13,712,900	Alabama	2,140,000
Indiana	6,551,880	Maryland	1,662,600
Illinois	5,032,600	West Virginia...	1,180,000

These are capacities as of Dec. 31, 1927, the total of the United States being 59,435,766 gross tons. Residents of Detroit have lately acquired the impression that Michigan has become a great steel State, but it is assigned only 340,000 tons capacity, thus trailing distant California as well as Minnesota, on another edge of the country.

Added interest is given to these capacity statistics by the exhibits published elsewhere in this week's IRON AGE, comparing the rolling capacity in twelve different districts in nine classes of finished steel products. These are to be studied in connection with the reference made in the opening paragraph above to a possible relation between the shifts in steel making and the abolition of Pittsburgh Plus. Consideration should be given also to the development of new lines of finished steel manufacture in the Chicago district and to the increased use of waterways in the shipment of steel products, though to an extent these are to be reckoned as effects of the new regime of plural basing.

Changing Currents in Exports

THERE have been some notable gains in exports of steel products in the first half of the year, as compared with the first half of last year, and there have been some equally notable losses. Among the gains are 14,000 tons in steel bars (to which may be added 4500 tons more in alloy steel bars), nearly 24,000 tons in plain structural shapes and 9000 tons more in fabricated structural materials, nearly 12,000 tons in steel rails and an additional 9400 tons in rail fastenings, and 28,000 tons in wire products, of which 8000 tons was in plain wire, 15,000 tons in barbed wire and woven wire fencing and more than 5000 tons in wire nails.

Offsetting these gains, there have been losses of 11,000 tons in galvanized steel sheets, almost 28,000 tons in tin plate, nearly 27,000 tons in boiler tubes and other pipe and smaller amounts in other materials.

In the case of bars almost the whole gain came from increased shipments to Canada, which went from 34,700 tons to 46,500 tons. In plain heavy structural material Canada again accounted for most of the increase, exports to our Northern neighbor advancing from 54,000 tons to 75,500 tons. Rail shipments, how-

ever, took a different course. There was a gain of more than 20,000 tons in rails sent to Chile, almost 9000 tons in rails to Colombia and 8000 tons to China. Simultaneously, there was a decline of 11,000 tons in rail shipments to Japan, 7000 tons to Cuba and almost 4000 tons to Canada.

When it comes to wire shipments, Argentina made a heavy gain in plain and galvanized material, exports to that country having advanced from 557 tons to 4700 tons. Similarly with barbed wire and woven wire fencing; the exports to Argentina went up from 2353 tons a year ago to 8869 tons in the first half of this year. Under this classification Brazil also participated in the larger buying, taking more than 8650 tons, nearly double the 4800 tons of last year.

Reduction in shipments of tin plate is about half accounted for by the smaller takings of Argentina, which dropped from 24,000 tons to a little more than 10,000 tons. Brazil dropped off nearly 5000 tons, Great Britain 3800 tons, and Japan 3300 tons.

As a whole, the exports of the first half have shown a moderate improvement over those of last year. Deducting scrap exports, which have been more than twice as great this year as last, the total remains at 1,108,000 tons, against 1,029,000 tons last year.

With the prospect that the year's iron and steel exports will run in excess of the average of 2,120,000 tons in 1926 and 1927, which was 400,000 tons more than the average for 1924 and 1925, wonder will grow the more at the fantastic proposal of a New York banker in a public address last year that the steel manufacturers of the United States abandon export trade in steel in favor of their European competitors.

THE half-year index to THE IRON AGE covering the first six months of 1928 is now available for distribution. Those who have asked for the index in the past will receive it as before, so only those not on the list need make the request at this time, addressing the Reader Service Department, Iron Age Publishing Co., 239 West Thirty-ninth Street, New York.

CORRESPONDENCE

Oxyacetylene Flame Temperature

To the Editor: I was particularly interested in the statements about oxyacetylene flame temperature contained in your issue of July 26 (page 232), and I cannot refrain from quoting from a letter written to me by the late Prof. Joseph W. Richards on Oct. 15, 1916. He says that the theoretical temperature of the flame is 7250 deg. Fahr., and goes on:

"This solution neglects the small decomposition of CO₂ and H₂O at high temperatures, which would reduce this temperature some. I have not made that calculation, but it would probably reduce the temperature at the hottest part of the flame to 5400 deg. Fahr."

This is remarkably close to the figure (3100 deg. C. or 5600 deg. Fahr., in round numbers) obtained by Professor Henning in Germany. I referred to this in my paper that was read before the American Institute of Mining Engineers in February, 1918, the title of which was, "Some Structures in Steel Fusion Welds."

Consulting engineer Union Carbide and Carbon Research Laboratories, Inc.
Long Island City, N. Y.

Pig Iron Output Declined in July

Estimated Daily Rate of Production Was 3900 Tons or 3.8 Per Cent Less Than June Figure—Net Loss of Four Furnaces

TELEGRAPHED reports received by THE IRON AGE from all producers of pig iron in the United States, estimating their output for the last two days of July, indicate that daily production declined about 3.8 per cent, as compared with the June rate. These returns show a total estimated production of 3,063,841 tons or 98,834 tons daily during July. In the previous month total actual tonnage amounted to 3,082,000 tons, or 102,733 tons daily, the decrease in rate per day having been 3899 tons. In June there was a decrease from May of 3198 tons daily or 3 per cent.

According to these preliminary returns for July, six furnaces were blown in during the month and 10 blown out, a net loss of four furnaces. The loss was entirely in furnaces producing steel making iron, as the num-

ber of merchant stacks remains unchanged, two having been blown in and two out. The number of blast furnaces operating on Aug. 1 was thus 185, as compared with 189 on

July 1 and 198 on June 1.

Estimated production by districts is shown in the accompanying table and complete data for July will be published in THE IRON AGE of Aug. 9.

Non-Ferrous Metal Institute Is Organized

The Non-Ferrous Ingot Metal Institute was organized at a meeting held at Atlantic City, N. J., on July 20, at which most of the principal producers of the non-ferrous ingot metal ratified a constitution and by-laws and elected officers and executive committee members.

The first officers of the institute are: President, Benjamin Harris of Benjamin Harris & Co., Chicago; vice-president, I. Gleuck, Federated Metals Corporation, New York; treasurer, L. Chapman, H. Kramer & Co., Chicago; members of executive committee, William Lewin, Lewin Metals Corporation, St. Louis, and W. J. Coane, Ajax Metal Co., Philadelphia. R. D. T. Hollowell, experienced in trade organization work and at present secretary-treasurer of the American Face Brick Association, will shortly assume the management of the institute. Headquarters will be in Chicago.

"It is the ideal of the members of the institute," said Mr. Harris, "to develop policies which will be of constructive benefit both to the industry and the consuming public. It will be our purpose to build slowly and soundly, drawing freely upon the best in modern, conservative thought to determine the institute's objectives. With this policy in view, the initial activity will be to make a survey of the problems of both the manufacturers and consumers. Not until this survey has been completed will the institute attempt to determine which

of the many possible activities it will pursue. We will undoubtedly undertake, sooner or later, extensive technical researches into the problems of manufacture and utility of non-ferrous ingot metals, commercial re-

BENJAMIN HARRIS

searches to determine how we may better serve our present customers and locate new fields for development, the adoption and promotion of the use of high standards of quality and specifications, the encouragement of sound business practices, voluntarily aiding in the prevention of unfair competition and trade abuses, and the promotion of intelligent business management on a basis of wholesome competition."

Statistical Iron and Steel Report for 1927

Several new tables have been added in the 1927 Annual Statistical Report of the American Iron and Steel Institute which are not to be found in earlier editions. Principal among them are those relating to foreign countries. Seven pages of production figures for the principal producing countries cover iron ore, pig iron and ferroalloys and steel ingots and castings. These are for more than 20 countries and, so far as data are available, are given for all the elapsed years of the twentieth century. Eight pages of new data cover, for 1923 to 1927, inclusive, exports of various leading iron and steel products from the United States to the principal consuming countries beyond our borders.

"Practical capacity" has been abandoned as a measure of current operation. What formerly was called "theoretical capacity" is now used, but it is called merely "capacity."

Otherwise, with a few exceptions, the volume, which is now 119 pages in place of 102 last year, is much as it has been before—a vast storehouse of data on the years' production of iron and steel products of various sorts, grouped as experience has shown will be valuable. Pig iron, ingots and castings, rolled products—these are the chief divisions. But to this is appended much other information, tributary or otherwise, which steel men and those studying their problems like to have in such convenient form.

Iron and Steel Markets

August Opens with Unusual Promise

Demand Shows Expanding Tendency—Smaller Recession in
July Pig Iron Output Than a Year Ago—New
Cash Discount for Sheets

MARKET developments in steel are on the up side. Demand, which brought July output close to that of June, shows more of a tendency to expand than to contract in August. Bookings with most companies have slightly exceeded shipments, and unfilled orders have thus gained in the past month. There is less selling pressure, and from all the main producing centers is reported a gathering of price firmness as a result. Also, here and there is evidence of a disposition to cover for forward business.

Operations are easily at a 75 per cent of capacity rate, sustained by buying which is chiefly for immediate needs from many varied consuming industries. And no one of these is promising an early increase of notable proportions.

Bar mill products have bulked large in the unusual summer activity, which has brought sales in the past week, as in Chicago, to the average of the year to date. The 1.90c., Pittsburgh, price is the basis of new transactions, but they cover only a small tonnage. Large users are on mill books at lower levels, but mills are beginning to insist on prompt specifying to avoid carry-overs beyond the contract period.

Sheets are moving in a better volume, with sheet mills generally operating at an 85 per cent rate. Some recession in fresh orders from the automobile builders is explained by the delays commonly met in getting into full production on new models.

Important action has just been taken in the sheet trade by the American Rolling Mill Co., with indications it will be followed by other sheet makers generally. Instead of allowing a discount of 2 per cent for payments in 10 days, the discount will be $\frac{1}{2}$ per cent, as has applied for years to practically all hot-rolled products. This change in trade practice may add \$4,000,000 to \$5,000,000 per annum to sheet mill incomes.

Plate bookings of 7000 tons for oil storage tanks are reported from Chicago, and welded pipe makers are pressing for deliveries, with one sale of 12,000 tons of plates for such pipe. Car repair and rebuilding programs of the railroads are a sustaining factor. In oil well casing, Venezuela placed 1000 tons in the United States and 500 tons in Germany.

In the railroad equipment field has appeared an inquiry from the New York Central Lines for 55 locomotives and from the Chesapeake & Ohio for 500 gondola car bodies. The Chicago & Eastern Illinois bought 100 automobile cars.

In rails small orders are allowing mills to hold

operations above expectations. The Wheeling & Lake Erie bought 2500 tons.

July contracts for structural steel were heavy, an Eastern steel company reporting its bookings as the largest of any month this year. Considerable work is in prospect, including 16,600 tons for the Reynolds Tower Building in New York, which is to exceed the Woolworth Building in height, 15,000 tons for a Wall Street bank and office building, and 15,000 tons for the Chicago Board of Trade Building.

Pig iron returns for July, collected by telegraph, with all producers heard from and estimating the last two days, showed a production of 3,063,841 gross tons, or 98,834 tons a day, compared with 3,082,000 tons in June, or 102,733 tons a day. The recession is thus 3.8 per cent, but the daily output in July, 1927, which was 95,199 tons, fell off over $7\frac{1}{2}$ per cent from June, 1927. On Aug. 1, there were 185 furnaces active, four less than on July 1.

Movement of pig iron to consumers is heavier than usual at this season, especially in the Ohio-Michigan territory, and there are signs in various markets of increasing buying interest in requirements for the rest of the year. Prices show little strength, however, and have given ground at St. Louis, where foundry grades have been marked down 50c. a ton, and in eastern Pennsylvania, where a 20,000-ton purchase of basic iron brought out prices 25c. a ton lower. Sales at Cleveland were 40,000 tons, the largest week's business since April.

A move toward elimination of preferential prices of \$1 or \$2 a ton, which many consumers and jobbers have been enjoying, notably on wire products, has been begun by some of the larger steel companies. A one-price policy, with extras for small lots, is the aim.

Exports of iron and steel, excluding scrap, were 197,000 gross tons in June, against 203,700 tons in May. In June, 1927, the total was 158,500 tons. For the half-year, exports have been 1,108,000 tons, compared with 1,029,000 tons last year. Including scrap, these figures become 1,358,742 tons and 1,133,427 tons respectively.

Iron and steel imports in June were 65,819 gross tons, comparing with 72,106 tons in the preceding month and 69,017 tons a year ago. Finished material was 33,789 tons in June, a drop of 13 per cent from the 38,968 tons of June, 1927.

Both of THE IRON AGE composite prices remain at last week's levels. That for pig iron is \$17.04 a ton and that for finished steel is 2.319c. a lb.

Pittsburgh

Sustained Demand for Steel Keeps Ingot Output at 75 Per Cent—Stronger Stand on Prices

PITTSBURGH, July 31.—The steel market continues to surprise by a sustained demand at a time of year when it is usually on a tapering scale. In ingot production it shows more of a tendency to expand than to contract. Ingot production in the combined Pittsburgh, Youngstown, Wheeling and Johnstown districts is easily 75 per cent of capacity. In Youngstown, open-hearth furnace operations are more than 80 per cent, but the general average of that district is somewhat reduced by a rather low rate of Bessemer converter operation. A few low spots in plant engagement in the Pittsburgh district proper are more than counterbalanced by substantially full operation of steel works in Weirton and Steubenville. Based upon the number of active productive units, July is ending more actively than it began and, so far as this district is concerned, the month's ingot output, it is believed, will be very little smaller than that of June.

Wire products, as usual at this season of the year, are in light demand. While there has been some increase in the demand for oil country pipe, it has not assumed proportions sufficient to lift the market out of dullness. Rails and track fastenings are experiencing the quietness common to this time of the year. Bolts, nuts and rivets also are slow. In other finished steel products, however, business is

good, particularly for this season. Tin plate makers are freed from concern about new business between now and the end of September. Sheet business is active and there is cheerfulness in the reports as to the specifications for bars and shapes.

Railroad buying of sheets, done in quiet fashion, turns out to have been appreciably larger for at least one producer than it was in the corre-

sponding period last year. Generally, however, railroad buying has been disappointing in that it has not included many cars or locomotives, which not only mean orders for steel, but engagement of a good many fabricating plants.

The difference between present demand from the motor car builders and that of a month or two ago is very slight. This industry has had an exceptional season in production and sales; the question now is as to whether as the fall approaches the demand will continue as strong as it is now and whether the steel requirements of this industry will hold up to their present rate.

Pittsburgh has a favorable prospect in steel construction projects, but as they run heavily to railroad, Federal and county work, lettings are likely to be spread out over a longer period than if they were private ventures.

The movement toward a stronger price stand is gaining ground. Selling pressure in sheets and strips, which have been the weakest in the finished steel list, appears to be abating and on these lines there is increasing talk

of an advance on fourth quarter business.

Pig iron demands are small individually and in the aggregate. Scrap prices appear to be sustained more by dealer than consumer buying. The first change in spot furnace coke prices since the latter part of February has been an advance of 15c. a ton, brought about by a demand from a steel company to supplement its own production, which has swept the market bare of spot supplies suitable for blast furnace use.

Pig Iron.—There is a reasonably heavy movement of iron on old orders, but new business consists chiefly of the actual necessities of the smaller melters, who rarely buy much in advance of their known requirements. Some producers believe that the price situation is a little stronger, but the only evidence to support this is that Valley foundry iron has moved to certain Ohio points at which Cleveland furnaces have some advantage in freight charges over the Valley producers. In this district, on account of the changed mode of buying and the fact that melters rarely send out inquiries for iron, it is necessary for sellers to canvass the trade thoroughly and frequently. Such efforts mean orders but do not impress the buyer with the possibility of shortages of iron or of higher prices.

Prices per gross ton, f.o.b. Valley furnace:

Basic	\$16.00
Bessemer	17.00
Gray forge	\$16.25 to 16.50
No. 2 foundry	16.50 to 16.75
No. 3 foundry	16.25 to 16.50
Malleable	17.00
Low phos., copper free....	26.50

Freight rate to Pittsburgh or Cleveland district, \$1.76.

Ferroalloys.—Not much new business is developing, but consumers are taking shipments against contract commitments at a rate quite satisfactory to producers. Only a few of the larger users of ferromanganese failed to make provision against having to pay the advanced price effective on last half tonnages, and some have enough tonnage bought at \$100, Atlantic seaboard, to supply their needs through this quarter.

Semi-Finished Steel.—Billets, slabs and sheet bars are moving well on contracts generally priced at \$32,

Pittsburgh, for this quarter. Sheet and tin plate producers are well supplied with business; in strips, orders are making a good showing for this time of the year and July bookings have been only slightly behind those of June. Fresh purchases do not amount to much. Wire rods are only moderately active; the ruling price is \$42, base, Pittsburgh, but some tonnage placed at less and carried over by producers figures in the mill deliveries.

Bars, Plates and Shapes.—Bars and shapes are moving well on contracts, but in plates, both orders and specifications are rather light. So far as strictly new business is concerned, 1.90c., base Pittsburgh, now is minimum, but with the generous coverage given contract buyers at 1.85c., there is little new business except from small-lot buyers. The mills, however, are insistent that buyers specify on their 1.85c. contracts in the effort to avoid carrying any tonnage at that price beyond this quarter. This district has promising prospects for the next year in structural projects. Three bridges that will take 20,000 tons or more of steel are to be provided for from the \$43,000,000 county bond issue recently approved by the voters. A new Federal building is in sight for Pittsburgh, and the Pennsylvania Railroad is expected to spend about \$50,000,000 in bettering its local terminal facilities. That road has placed 1100 tons for a fruit auction shed at its local freight yards.

Rails and Track Supplies.—This is rarely an active period in rails and track fastenings, and this year is no exception. Prices show no change.

Wire Products.—The price situation is more stable than manufacturers have experienced in a long time. Nails are well established at \$2.55, base, per keg, Pittsburgh, and plain wire at \$2.40, base, per 100 lb., and no deviations from these prices are reported. Business is very quiet.

Tubular Goods.—A good many pipe line projects are reported to be under consideration, but producers take more satisfaction from the fact that actual orders for oil country pipe show a moderate but sustained increase and

that building and construction pipe is going out steadily. The secondary market, following a revision in the resale quotations which resulted in lower open prices, but an advance in actual sales prices, is really steady for the first time in at least two years. In tubing the best movement appears to be in the requirements of the motor car builders.

Sheets.—Business continues good, and while prices are not actually higher than they have been, the undertone of the market is firmer and an effort toward establishing 2c., base, on blue annealed, 2.65c., base, on black, and 3.50c., base, on galvanized, is finding a more general following. Although the common impression is that the railroads have not been taking much steel, a checkup by a local maker of sheets discloses that business from that source made a good gain in the second quarter over the first three months of the year and that the record for the first half of this year is appreciably better than for the same period last year. The American Sheet & Tin Plate Co. last week operated at 80 per cent of capacity and is scheduled at approximately that rate for this week. Independent mill operations are somewhat higher and the industry as a whole is running at around 85 per cent.

Tin Plate.—Production keeps up at a high rate in spite of the effect of hot weather upon mill crews. Some urgency of demand is indicated by the fact that the American Sheet & Tin Plate Co., in order to make good any loss of production due to hot weather, has been scheduling its mills on a 17-turn basis. Few makers can take sizable orders now for delivery before the middle or latter part of September.

Cold-Finished Steel Bars and Shafting.—There is little variation from week to week in the rate of mill shipments. The common report is that specifications are good for the time of year. There is nothing new as to prices.

Hot-Rolled Flats.—While July has not done so well as June in point of specifications and shipments, it is generally regarded as a satisfactory

Carbon Vanadium	0.95	3.60

Above prices are for hot-rolled steel bars, forging quality. The ordinary differential for cold-drawn bars is 1c. per lb. higher. For billets 4 x 4 to 10 x 10 in., the price for a gross ton is the net price for bars of the same analysis. For billets under 4 x 4 down to and including 2½ in. squares, the price is \$5 a gross ton above the 4 x 4 billet price.

Slabs with sectional area of 16 in. or over carry the billet price; slabs with sectional area of 12 in. to 16 in. carry a \$5 extra above the billet price and slabs with a sectional area under 12 in. carry the bar price.

Band sizes are 40c. per 100 lb. higher.

Rails

Per Gross Ton

Standard, f.o.b. mill.....	\$43.00

month because it ran so well ahead of the average for that month in the past few years. Prices are not quotably higher, but there is evidence that makers are tiring of doing business at prices that yield little, or at best a moderate profit, and selling pressure is lighter than it has been. In line with the tendency in some of the other finished steel products, it is expected that higher prices will be asked on fourth quarter tonnages. The common prices of local producers are 1.80c. to 1.90c., base, for wide strips, 2c. for 3-in. to 6-in., and 2.10c. to 2.20c. for less than 3-in. widths, while cooperage stock does not appear to be going at less than 2.30c.

Cold-Rolled Strips.—There has been much less than the usual summer dip in orders. This fact, coupled with the small profit that present prices yield, is reflected in a lessened anxiety for orders and a slightly steadier price situation. Makers generally are talking of an advance on fourth quarter business.

Bolts, Nuts and Rivets.—Business is rather slow in these products and is easily accommodated by a plant engagement of about 50 per cent of capacity. Railroad buying is at very close range and for real requirements. Lack of volume from this direction is an important factor in the dullness. Prices are still firm.

Coke and Coal.—Spot furnace coke has stiffened in price in the past few days, and against fairly liberal offerings recently at as low as \$2.60 to \$2.65, per net ton, at ovens, there are now no supplies of coke suitable for blast furnace use at less than \$2.75c. A steel company has been picking up spot tonnages steadily and it is said will be in the market for the next month or so, as its own by-product oven production is insufficient for its requirements. Beehive oven furnace coke production lately has been slipping steadily and it is doubt-

ful if much capacity now idle will be brought into production, since even at today's price the profit is not large enough to encourage repairs to idle ovens. Two Valley merchant producers of pig iron, which formerly operated their furnaces on beehive coke, now are running on by-product coke from steel company ovens, the coal being furnished by the buyers. Spot foundry coke still is in ample supply and rather easy in price. Some coal is moving to the Lakes, but otherwise the demand is slow and prices still are weak.

Old Material.—Blast furnace grades of scrap are higher, but generally the market is quotable at the levels of a week ago. Open-hearth grades are firm, as offerings are moderate and dealers with short orders to fill are covering them as fast as they can, usually at \$14 for heavy melting steel and in some cases at a little more. It is commonly realized that sales of a few weeks ago at \$14 were poor ones from the standpoint of profits, and with the possibility that steel works operations and scrap requirements will be larger in another 30 or 45 days, most sellers are inclined to take a small loss than run the risk of a larger one later. The August scrap list of the Pennsylvania Railroad contained approximately 36,000 net tons and that of the Baltimore & Ohio 10,020 gross tons. As dealers are bullish,

it is believed these lists will realize rather stiff advances over current prices.

Prices per gross ton delivered consumers' yards in Pittsburgh and points taking the Pittsburgh district freight rate:

Basic Open-Hearth Grades:	
Heavy melting steel.....	\$14.00 to \$14.50
Scrap rails	13.50 to 14.00
Compressed sheet steel....	13.75 to 14.00
Bundled sheets, sides and ends	13.00 to 13.25
Cast iron carwheels.....	14.00 to 14.50
Sheet bar crops, ordinary....	14.50 to 15.00

REINFORCING STEEL

OUTSTANDING among awards of 5400 tons reported during the last week were a bridge at Providence, R. I., which took 1800 tons, and a railroad terminal warehouse in New York requiring 1200 tons. A manufacturing building in Chicago calls for 2000 tons of the 2700 tons needed for new projects. Awards follow:

CAMBRIDGE, MASS., 100 tons, Boston & Maine Railroad warehouse, to Joseph T. Ryerson & Son.

BOSTON, 100 tons, Charles Street Garage Corporation, Cambridge Street, to Edwin A. Tucker.

PROVIDENCE, R. I., 1800 tons, Memorial Bridge; from Merritt-Chapman & Scott Corporation, general contractor, to McClintic-Marshall Co.

NEW YORK, 1200 tons, terminal warehouse for Lehigh Valley Railroad at 144th Street and Girard Avenue, to Concrete Steel Co.

CREIGHTON, PA., 100 tons, Pittsburgh Safety Glass Co., to Carlem Engineering Co.

CHICAGO, 100 tons, apartment building for H. B. Ryan, to Concrete Engineering Co.

CHICAGO, 200 tons of rail steel, caissons for Mercantile Mart, to Inland Steel Co.

CHICAGO, 900 tons, instead of 300 tons recently reported, plant for William J. Igoe Printing Co., to Kalman Steel Co.

CHICAGO, 256 tons of rail steel, garage at Eleventh and State Streets, to Calumet Steel Co.

CHICAGO, 220 tons of rail steel, Cook County road work on Cicero Avenue; placed by Chicago Heights Coal Co., contractor, with Calumet Steel Co.

OAK PARK, ILL., 200 tons of rail steel, apartment building at Seventy-third Avenue and Lake Street, to Calumet Steel Co.

MARSHALL COUNTY, ILL., 100 tons of rail steel, County road work; placed by Mid-West Supply Co., contractor, with Calumet Steel Co.

SEATTLE, WASH., 300 tons, store and a building for Richfield Oil Co., to Pacific Coast Steel Co.

TACOMA, WASH., 100 tons, chemical plant, to Northwest Steel Rolling Mills.

LOS ANGELES, 180 tons, retaining wall for Riverside-Dayton viaduct, to unnamed interest.

Reinforcing Bars Pending

Inquiries for reinforcing steel bars include the following:

NEW YORK, 300 tons, Harlem River tunnel; George H. Flynn Corporation, general contractor.

CHICAGO, 3000 tons, five junior high schools taking 600 tons each; bids, which are on entire tonnage, taken last week.

CHICAGO, 2000 tons, building for General Electric Co., West Pershing Road and Ashland Avenue; Graham, Anderson, Probst & White, architects.

SAN FRANCISCO, 300 tons, power house for Great Western Power Co.; bids soon.

SACRAMENTO, CAL., 108 tons, paving in Sacramento County; bids Aug. 15.

Steel Mill Backlogs Gained Slightly in July—Ingot Output 75 Per Cent With Outlook More Favorable

CHICAGO, July 31.—In contrast with a year ago, steel mill backlogs gained a trifle in July. The net result is that both new business and shipments of finished steel products in the seventh month of this year established a record over the corresponding periods in former years. The rate of specifying as August starts has not decreased and the belief is common that August will be better than the average summer month. Sales in the past week were equal to the average so far this year, showing marked improvement over the previous seven-day period. The bulk of this business is in bar mill products that are being directed principally to the manufacturers of automobiles and accessories.

Cold-drawn bar makers are taking larger quantities and railroads find heavier needs as they sustain car repair and rebuilding programs that are more extensive than is common at this time of the year. Manufacturers of welded pipe are pressing for deliveries and oil storage tank programs are of greater moment, bringing to this market plate business that is urgently needed in the absence of normal railroad equipment construction.

The No. 2 furnace at Gary was taken out of service July 28, bringing the count of active Steel Corporation stacks to 16 out of 27 in this district. In the meantime, ingot output remains at 75 per cent of capacity and the outlook is a trifle more favorable than a week ago that this rate will be maintained.

Sheets are moving in better volume and sales are more numerous at present quotations.

Both jobbing and contract foundries in this territory have taken on additional work and are in need of heavier shipments of pig iron. Sales, about one-half of which are for the third quarter and the remainder for the next five months, aggregate 30,000 tons in one of the most active buying periods since before the turn of this quarter.

Pig Iron.—Numerous sales of 500 to 3000 tons each mark this as an unusually active week in northern Illinois and southern Wisconsin, July sales were in excess of those in either July, 1926, or July, 1927, and purchases for the first seven months in 1928 are substantially ahead of the corresponding period in 1927. The foundry melt has grown measurably in the last 10 days, this being equally true of jobbing and contract shops. Production in the Chicago district remains steady and sellers continue to reduce stocks. The Cadillac furnace, a producer of charcoal iron, has been blown out.

Prices per gross ton at Chicago:

N'th'n No. 2 fdy., sil. 1.75 to 2.25..	\$17.50
N'th'n No. 1 fdy., sil. 2.25 to 2.75..	18.00
Malleable, not over 2.25 sil.....	17.50
High phosphorus	17.50
Lake Super. charcoal, sil. 1.50.....	27.04
So'th'n No. 2 fdy. (all rail).....	21.51
So'th'n No. 2 (barge and rail).....	21.01
Low phos., sil. 1 to 2, copper free	\$28.50 to 29.00
Silvery, sil. 8 per cent.....	29.79
Bess. ferrosilicon, 14-15%.....	46.79

Prices are delivered consumers' yards except on Northern foundry, high phosphorus and malleable, which are f.o.b. local furnace, not including an average switching charge of 61c. per gross ton.

Ferroalloys.—A sale of 1000 tons of 19 to 21 per cent spiegeleisen is reported at St. Louis at \$31, Hazard, Pa. In the local market, this commodity is quiet. A Chicago steel mill user is making inquiry as to the possibility of bringing 3000 tons of ferromanganese by boat from Europe to Chicago.

Prices delivered Chicago: 80 per cent ferromanganese, \$112.56; 50 per cent ferrosilicon, \$83.50 to \$87.50; spiegeleisen, 19 to 21 per cent, \$40.76.

Structural Material.—Although new business and that in prospect are of good size, contractors predict that the early fall will see a marked recession in large building activities in the Chicago area. Fabricators are already beginning to complain about conditions, though it is more on account of small backlogs than because of lack of work in shops at the beginning of the new month. Structural orders for the week total more than 7000 tons. A St. Louis shop will fabricate 1500 tons for an express building in that city. The Apparel Mart, Chicago, which is still in the stage of being financed, is now said to require between 50,000 and 60,000 tons of steel. Following the formation of the Colgate-Palmolive-Peet combination, an enlargement of the Palmolive-Peet Building in Chicago has been ordered. Over 3000 tons has been added, bringing the total order to 7000 tons of structural steel. Among old inquiries that are being revived is 15,000 tons for the Chicago Board of Trade Building.

Mill prices on plain material, per lb.: 2c., base, Chicago.

Plates.—Of special importance to the local plate market are three orders for tank materials totaling over 7000 tons. This steel is for fabrication and erection in the Southwest. Definite action has not been taken on 12,000 tons sought by the Texas & Pacific Oil Co., but local sellers expect that orders will be placed in the next few days. The Humble Oil & Refining Co. may soon come into the market for a large tonnage of tankage materials and other oil companies are said to be contemplating similar action. All told, steel demand from the Southern and Southwestern oil fields promises well for August. Manufacturers of welded pipe are unusually busy and are pressing mills for weekly deliveries in excess of the tonnage scheduled at the time contracts were placed. Reports are insistent that railroad equipment purchases will be-

come larger and more numerous in the late summer and early fall. Orders this week include 100 automobile cars for the Chicago & Eastern Illinois and 100 underframes for the Fruit Growers' Express. Noteworthy among fresh inquiries is one for 500 gondola car bodies for the Chesapeake & Ohio and another for 100 automobile cars for the Missouri Pacific. Railroad repair programs are fully up to schedules in previous summers, as shown by specifications from that source. General demand for plates is surprisingly broad, and the total tonnage being ordered out clearly shows that the seasonal drop in shipments is less than a year ago, in spite of the fact that car shops are in need of little material. Deliveries average about three weeks and prices are steady at 2c., Chicago.

Mill prices on plates, per lb.: 2c., base Chicago.

Bars.—Users in practically all lines are making heavy demands for soft steel bars, with the result that a sharp increase is noticed both in new buying and specifications. While a few sales represent needs to finish out the third quarter, the bulk of new business is at close range. The total volume of specifications is above production at the moment. Individual releases are small and call attention to the fact that, while demand is widespread and above expectations, the attitude of buyers is conservative. Automobile manufacturers are still the most prominent among users of bar mill products. It is the steadiness of this industry that largely accounts for the largest July bar shipments in four years. Backlogs have grown a trifle and deliveries range from three to four weeks. Although iron bar mills are far from fully engaged, current orders at 2c. and specifications are considered satisfactory for this time of year. Shipments of alloy bars are but a reflection of the continued activity among manufacturers of automobiles. Prices and alloy differentials are steady. Shipments of rail steel bars do not match with production, thus affording producers an opportunity to build stocks against needs for reinforcing bars and fence posts. Contracts are on the basis of 1.85c., Chicago Heights, whereas small miscellaneous orders are being taken at 1.90c.

Mill prices per lb.: Soft steel bars, 2c., base, Chicago; common bar iron, 2c., base, Chicago; rail steel bars, 1.85c., base, Chicago Heights mill.

Reinforcing Bars.—Lettings are light, but an unusually large amount of business is pending and in prospect. July has been the leading month in 1928 in the number of quotations made on reinforcing work, and likewise the past seven days have seen the most active quoting of any week so far this year. Bending shops are still operating at 75 to 80 per cent of capacity. Recent lettings and inquiries are shown on page 308.

Sheets.—An upturn in operations is following closely on a larger volume of orders and specifications. Buyers

are now giving evidence that they wish to take advantage of the present low prices and that they are not willing to allow stocks to run to lower levels. The bulk of purchases are for 60 days and some inquiry has been made as to the attitude that producers will assume in booking business beyond the end of this quarter. Output stands close to 70 per cent of hot mill capacity.

Base prices per lb., deliv'd from mill in Chicago: No. 24 black sheets, 2.80c.; No. 24 galv., 3.65c.; No. 10 blue ann'd, 2.15c. Deliv'd prices at other Western points are equal to the freight from Gary plus the mill prices, which are 5c. per 100 lb. lower than Chgo. deliv'd prices.

Rails and Track Supplies.—Local rail mills have been able to hold operations above expectations as result of a steady number of new small orders and additional releases against optional tonnages. Fresh inquiry for standard-section rails totals 2000 tons in miscellaneous lots. Sales of light rails in July were of good size when compared with the demand for this product in some previous months. New sales in track fastenings total 1500 tons, and specifications, which are larger, assure the maintenance of the rate of operations which has been adhered to during the past 30 days. A lot of iron tie plates has been taken at \$43 a ton, Chicago.

Prices f.o.b. mill, per gross ton: Standard-section open-hearth and Bess. rails, \$43; light rails, rolled from billets, \$36. *Per lb.:* Standard railroad spikes, 2.80c.; track bolts with square nuts, 3.80c.; steel tie plates, 2.15c.; angle bars, 2.75c.

Bolts, Nuts and Rivets.—Specifications are steady and output ranges between 60 and 65 per cent of capacity. Users who are not covered by contracts are entering the market more freely and spot sales on makers' books represent close to 25 per cent of total orders. Prices are firm.

Coke.—By-product foundry coke is moving more rapidly against second half contracts, this being a reflection of the greater activity among foundries. Prices are steady at \$8, f.o.b. local furnaces.

Old Material.—Purchases of heavy melting steel and cast iron borings have brought prices 25c. above the levels of a week ago. Quotations for

most grades appear steady in the face of a greater number of small purchases by a wider circle of buyers. One of the local steel mills has taken heavy melting steel at \$13 a gross ton, delivered, while two users of borings each have ordered 500 tons at \$9.75. That an oversupply of scrap exists in this district is shown by the fact that rejections are unusually frequent and dealers are seeking outlets at Lake Erie ports. Although there may be an outward flow of scrap by water routes, it is probable that the Detroit district will furnish Chicago with certain grades by the same means of transportation. A dealer has paid at Indianapolis \$12.25 a gross ton, delivered Gary, for a round tonnage of heavy melting steel. The Chicago & North Western will sell 6000 tons and the Santa Fe is offering 8000 tons.

Prices deliv'd consumers' yards, Chicago:
Per Gross Ton

Basic Open-Hearth Grades:	
Heavy melting steel.....	\$12.50 to \$13.00
Shoveling steel	12.50 to 13.00
Frogs, switches and guards, cut apart, and misc. rails	13.50 to 14.00
Hydraul. compressed sheets	11.00 to 11.50

Stove plate	10.75 to 11.25
Grate bars	11.25 to 11.75
Brake shoes	10.00 to 10.50

*Relaying rails, including angle bars to match, are quoted f.o.b. dealers' yards.

Wire Products.—Although July sales and production both dropped a trifle below the June totals, it is significant that July was unusually good. This can be accounted for in large measure by the uniform demand from the manufacturing trade because distribution in the farm areas has been cut during the time of intensive work in the fields. Demand for nails is

taking a turn for the better, but it is still far below the expectations of sellers during this, the active building season. Prices for wire nails are \$2.60, base, per keg, Chicago. Quotations on plain wire are steady at \$2.45 per 100 lb.

Cast Iron Pipe.—James B. Clow & Sons have taken 950 tons of 8-in. and 75 tons of 12-in. pipe for Milwaukee at \$42.24, delivered, or \$33.74, Birmingham. Contractors, having completed much of the work given them earlier in the year, are looking for fresh contracts and the prices they are bidding are lower than they were a month or six weeks ago. Fresh inquiry is not large and producers foresee a less active summer than in some of the past years. Springfield, Ill., will buy 700 tons of 10 and 16-in. class C and 36-in. class A pipe. The inquiry by St. Clair Shores, Mich., for 2200 tons, is still open. Railroads are taking cast iron in limited quantities and public utilities are finding a normal midsummer use for this commodity.

Prices per net ton, deliv'd Chicago: Water pipe, 6-in. and over, \$42.20 to \$43.20; 4-in., \$46.20 to \$47.20; Class A and gas pipe, \$4 extra.

RAILROAD EQUIPMENT

New York Central Inquires for 55 Locomotives

THE New York Central's inquiry for 55 locomotives is the feature of the week's equipment market. An additional 13 locomotives are also wanted for export. The Chesapeake & Ohio will purchase 500 gondola car bodies. Buying has been light, the only sizable order having been placed by the Chicago & Eastern Illinois for 100 automobile cars. Details of the week's business follow:

Chesapeake & Ohio has made inquiry for 500 70-ton hopper-bottom gondola car bodies and repairs to trucks.

Seaboard Air Line is said to have definitely withdrawn its recent inquiry for 1000 box cars.

Chicago, Rock Island & Pacific has placed 10 air-dump cars with Western Wheeled Scraper Co.

Chicago & Eastern Illinois has purchased 100 40-ton automobile cars from Mount Vernon Car Mfg. Co.

Cincinnati, Hamilton & Dayton has ordered 10 ballast cars from American Car & Foundry Co.

Fruit Growers Express has ordered 100 steel underframes for refrigerator cars from Pressed Steel Car Co.

Southern Pacific is inquiring for four gas-electric rail motor cars.

Chilean State Railways have made inquiry for 20 coaches and six sleeping cars. Bids will be received Nov. 23.

Buenos Aires & Pacific, Argentina, is inquiring for eight Mikado type locomotives.

F. C. Cochabamba, Santa Cruz, Bolivia, has ordered two Mikado type locomotives from American Locomotive Co.

Hu Len Hei Hun, China, is inquiring for five Mikado type locomotives.

New York Central is inquiring for 25 locomotives, type 4-8-2, and 30 locomotives, type 4-6-4.

Northern Illinois Coal Corporation has purchased six air-dump cars from Koppel Industrial Car & Equipment Co.

Philadelphia

Basic Pig Iron Declines Slightly on 20,000-Ton Purchase— Steel Prices Strengthening

PHILADELPHIA, July 31.—Orders for steel have registered a slight decline in the past week, but the total for the entire month is reported by most mills to have been quite satisfactory. Sellers are showing considerable determination in their effort to advance prices to 2.05c., Coatesville, on plates, 1.90c., Pittsburgh, on bars, and 2.05c., Bethlehem, on shapes. Sheet mills are also seeking to eliminate the tendency to weakness in prices and are beginning to offer more resistance to concessions. Shape prices are still unstable and on a lower level than quotations on plates or bars, with the market ranging from 1.95c., Pencoyd, Pa., to 2c., Bethlehem. On a purchase of 20,000 tons of basic pig iron by an Eastern steel company, the price declined 25c. a ton.

Pig Iron.—An eastern Pennsylvania consumer of basic iron, which has been inquiring for about 20,000 tons, has bought. Based on this and another recent purchase, basic iron is quotable at \$18.75 to \$19.25 per ton, delivered. Among recent inquiries for the foundry grade are a number of lots for the United States Navy, including about 400 tons for Puget Sound, and about a carload each for the navy yards at Portsmouth, Brooklyn and Philadelphia. The Baldwin Locomotive Works, Eddystone, Pa., is inquiring for 1500 to 2000 tons of cylinder iron, about 1.40 per cent silicon content, and the New York Air Brake Co., Watertown, N. Y., is in the market for about 100 tons of silvery iron. The present price of \$19.50 per ton, base furnace, on the foundry grade is apparently being maintained on current orders, which are composed principally of small lots. Sellers in this district report that some small tonnages of Buffalo iron are arriving for consumers in this territory.

Prices per gross ton at Philadelphia:

East. Pa. No. 2, 1.75 to	
2.25 sil.	\$20.26
East. Pa. No. 2X, 2.25 to	
2.75 sil.	20.76
East. Pa. No. 1X.....	21.26
Basic (del'd east. Pa.)...	\$18.75 to \$19.25
Gray forge	19.75 to 20.25
Malleable	21.00 to 21.50
Stand. low phos. (f.o.b.	
N. Y. State furnace)...	22.00 to 23.00
Cop. b'r'g low phos. (f.o.b.	
furnace)	23.00 to 23.50
Va. No. 2 plain, 1.75 to	
2.25 sil.	24.54
Va. No. 2X, 2.25 to 2.75 sil.	25.04

Prices, except as specified otherwise, are deliv'd Philadelphia. Freight rates: 76c. to \$1.64 from eastern Pennsylvania furnaces; \$4.54 from Virginia furnaces.

Ferromanganese.—Buying is mostly of one or two carloads, on which the market price of \$105 per ton, seaboard, applies. Sellers report that the Ford Motor Co., recently in the market for about 1000 tons of ferromanganese for its Fordson plant, claims to have been able to buy at less than the quoted price for second half of \$105 per ton, seaboard, but no intimation of the extent of the concession was given by the buyer.

Bars.—Except for a slight decline in buying during the last week of the month, there has been an active market throughout July. Mills are endeavoring to obtain 1.90c., Pittsburgh, or 2.22c., Philadelphia, on all new busi-

ness, but there are many uncompleted contracts at 1.85c., Pittsburgh.

Plates.—Mills are succeeding in obtaining 2.05c., Coatesville, or 2.15c., Philadelphia, on much of the current small-lot business, but on larger tonnages 2c., Coatesville, or 2.10c., Philadelphia, is not uncommon. Except for a slight decline in orders toward the end of the month, business in July has been quite satisfactory for most sellers.

Shapes.—Efforts to advance the market to the level of plates and bars have not as yet met with much success. The maker at Pencoyd, Pa., has been quoting 1.95c. to 2c. per lb., Pencoyd, or 2.01c. to 2.06c., Philadelphia, and other mills have been meeting this price. As a result, Pencoyd has become, at least temporarily, a more usual basing point for shape prices than Bethlehem. Small tonnages occasionally bring up to 2c., Bethlehem, or 2.13c., Philadelphia, but the usual range of quotations seems to be 2.01c. to 2.08c., Philadelphia, based on 1.95c., Pencoyd, and 1.95c., Bethlehem. Fabricators are bidding on a number of projects in this territory, including highway bridges in Philadelphia, a high school at Pleasantville, N. J., dormitories at Princeton University and a factory building at Camden, N. J.

Sheets.—Concessions have not en-

Warehouse Prices, f.o.b. Philadelphia

†For 50 bundles or more; 10 to 49 bun., 4.95c. base; 1 to 9 bun., 5.30c. base.

tirely disappeared on black and galvanized sheets, but mills are evidently engaged in an earnest effort to maintain the market at 2.65c., Pittsburgh, or 2.97c., Philadelphia, for black and at 3.50c., Pittsburgh, or 3.82c., Philadelphia, for galvanized. Evidently prices \$1 a ton lower on black and \$2 lower on galvanized sheets are still obtainable by preferred buyers and distributors, but sellers are showing more resistance to efforts to obtain these concessions. Blue annealed sheets are fairly firm at 2c., Pittsburgh, or 2.32c., Philadelphia.

Warehouse Business.—Jobbers report a slightly smaller volume of business in the past week, but the total for the month has been satisfactory. Prices appear to be quite firm and in an effort to bring warehouse quotations more nearly in line with present mill prices, most jobbers are preparing to advance the base price of steel bars and small shapes within the next few days, probably to 2.70c. per lb. Quantity differentials are reported to be well maintained on all products.

Imports.—In the week ended July 28, 2000 tons of chrome ore arrived at this port from Portuguese Africa and 751 tons of pig iron came from India. Steel imports consisted of 524 tons of structural shapes and 12 tons of bars from Belgium and 19 tons of strip steel and four tons of steel scrap from the United Kingdom.

Old Material.—Prices of all grades are substantially unchanged. No. 1 heavy melting steel is still quoted at \$13 per ton, delivered eastern Pennsylvania mills, but a sizable tonnage has been bought at Sparrows Point, Md., for \$12.50 per ton, delivered. While a Coatesville, Pa., consumer is unwilling to pay more than \$14 per ton for occasional carloads of heavy breakable cast, a Harrisburg user has recently closed on some of this grade at \$14.50 per ton, delivered. Other consumers show little interest in making contracts.

Prices per gross ton delivered consumers' yards, Philadelphia district:

No. 1 heavy melting steel.	\$13.00
Scrap T rails.....	12.50
No. 2 heavy melting steel.....	\$10.50 to 11.00

New York

July Lettings of Structural Steel Bulk Large— Improvement in Pig Iron Inquiry

NEW YORK, July 31.—Increasing interest of buyers in their fall requirements has been the feature of the pig iron market in the last week, new inquiry being estimated at from 10,000 to 12,000 tons. Including business which had already been quoted on, fully 15,000 tons is now pending in the territory served by New York selling offices and action is still awaited on about 3000 tons of ballast iron for shipment to the Pacific Coast. A large consumer of malleable iron has come into the market for 6000 tons for delivery during August, September and October to its plants at Bridgeport, Union City and New Britain, Conn.; Troy, N. Y., and Wilmington, Del., and a radiator manufacturer will purchase 1400 tons of foundry iron for delivery during the third and fourth quarters at Norwich, Conn. Another New England melter is in the market for 1000 tons and a New Jersey melter is inquiring for a like quantity. The New York Air Brake Co. expects to buy 100 tons of silvery iron for Watertown, N. Y. A number of smaller inquiries for August and September requirements are before the trade and the first half of August is expected to bring out a substantial volume of fourth quarter business. Sales during the last week amounted possibly to 10,000 tons, the largest purchase, 2000 tons, for delivery over the remainder of the year. The A. P. Smith Mfg. Co., East Orange, N. J., is said to have closed for 750 tons of No. 2 plain and No. 2X for fourth quarter delivery and has made inquiry for an additional 100 tons of special iron for mixture purposes. Other sales have been principally in small tonnages, but have been well distributed, indicating, as does the steady rate of shipments against old contracts, that foundry operations are being well sustained. Buffalo foundry iron is still quotable at \$16 to \$17, furnace, but there have been sales, both in New England and in the New York district, in which the silicon differential has been waived. It is reported that the barge rate from Buffalo to New York is soon to be advanced 50c. a ton, and this promises a heavier movement of iron during the next few weeks, both for immediate consumption and for storage against requirements during the late fall. Eastern Pennsylvania producers are quoting \$19.50, furnace, for the base grade, but at that level are not able to compete with Buffalo barge iron.

Prices per gross ton, deliv'd New York district:

Buffalo No. 2 fdy., sil. 1.75 to 2.25	\$19.51 to \$20.01
East. Pa. No. 2 fdy., sil. 1.75 to 2.25	20.89 to 22.02
East. Pa. No. 2X fdy., sil. 2.25 to 2.75	21.39 to 22.52
East. Pa. No. 1X fdy., sil. 2.75 to 3.25	21.89 to 23.02

Freight rates: \$4.91 from Buffalo, \$1.39 to \$2.52 from eastern Pennsylvania.

Plates, Shapes and Bars.—Structural steel lettings and inquiries in large volume continue to feature business in the heavy tonnage products. July awards of building work were large and prospects are encouraging for the rest of the summer. An award of 9500 tons for New York

subway work probably will be made this week. Outstanding among the inquiries is 18,000 tons for the new Reynolds Building, Forty-second Street and Lexington Avenue, which will be higher than the Woolworth Building. Another large building to be built at 1 Wall Street by the American Exchange-Irving Trust Co. will take about 15,000 tons. The dullness in the railroad equipment field continues, there being but one important inquiry and that is for 500 gondola car bodies and repairs to 500 trucks from the Chesapeake & Ohio. Prices on plates, shapes and bars are unchanged, but the tendency toward 1.90c., Pittsburgh, on bars is stronger and several fair-sized lots have been sold at that price. On plates, 2c., Coatesville, is the ruling price, while on shapes the mills are getting 2c., Bethlehem, with \$1 higher on both products in small lots. The demand for universal plates is exceptionally active, and one Eastern mill is unable to make better deliveries than three weeks, although shipments in a week to 10 days can be made of the sheared mill products.

Mill prices per lb., deliv'd New York: Soft steel bars, 2.19c. to 2.24c.; plates 2.12½c. to 2.22½c.; struct. shapes, 2.14½c. to 2.19½c.; bar iron, 2.14c.

Sheets.—Notwithstanding efforts of several of the larger manufacturers of sheets to stiffen prices, some of the recent low quotations have not disappeared. Sales of galvanized sheets have been made at 3.30c. and 3.35c., but the more common quotation is 3.40c., with some makers asking 3.50c. Black sheets range from 2.60c. to 2.65c., Pittsburgh; some makers will not go below 2.65c., but on competitive business of an attractive character the buyer has little difficulty in getting 2.60c. Blue annealed sheets are fairly steady at 2c., but there are occasional sales at \$1 or \$2 a ton less.

Pipe.—An American mill has taken an order for more than 1000 tons of oil well casing for shipment to the Venezuelan oil fields, and the American representative of a German maker booked about 500 tons from the same buyer.

Cast Iron Pipe.—There is a fair volume of private purchasing of pressure pipe, but very little municipal inquiry. Southern makers continue fairly firm at \$34 to \$35 per ton, base Birmingham, which is not competitive in this district with Northern foundries maintaining from \$37.60 to \$38.60 per ton, delivered New York. Most of the recent buying has been confined to small lots to complete installations.

Prices per net ton, deliv'd New York: Water pipe 6-in. and larger, \$37.60 to \$38.60; 4-in. and 5-in., \$42.60 to \$43.60; 3-in., \$52.60 to \$53.60; Class A and gas pipe, \$4 to \$5 extra.

Reinforcing Bars.—The McClintic-Marshall Co. will furnish 1800 tons of bars for a bridge at Providence, R. I., and the Concrete Steel Co. has booked 1200 tons for a railroad warehouse in New York. The run of small orders has kept up at about the rate of recent weeks. The Gibbs Rice Co., Inc., New York, is low bidder on a

high school at White Plains, N. Y., which will require about 500 tons, and 300 tons will be needed for a tunnel under the Harlem River, on which the George H. Flynn Corporation is general contractor. Effective Aug. 1, distributors in this territory will not ship cut-to-length from mills, except in 40, 50 and 60-ft. lengths. At the same time a warehouse price of 2.15c. per lb., Pittsburgh, has been announced, making a delivered price on cars at New York of 2.49c. This compares with the old Youngstown warehouse price of 2.20c., or 2.57½c. on cars at New York. New York warehouse prices are unchanged.

Warehouse Business.—Orders have been slightly smaller since about the middle of the month, but most jobbers estimate that the total business for July will equal or be slightly in excess of that in June. Black and galvanized sheet prices continue at about 3.80c. per lb., base, for black and 4.50c., base, for galvanized in the metropolitan district with quotations in local New Jersey about 20c. per 100 lb. higher. There has been no change in discounts on machine bolts and coach screws, but in most cases warehouses are offering 60 per cent off list, even for small lots, rather than quote a range of 55 to 60 per cent off.

Coke.—Specifications on foundry coke contracts are good, indicating good seasonal foundry operations, but new sales are few. Foundry coke is unchanged at \$3.50 per net ton, Connellsville, and the furnace grade is quoted at \$2.50 to \$2.75. Special brands of foundry coke are offered at \$4.85, f.o.b. ovens, and delivered prices are \$8.56 per net ton to northern New Jersey, Jersey City and New-

ark and \$9.44 to New York and Brooklyn. By-product foundry coke is unchanged at \$9 to \$9.40, Newark or Jersey City, and \$10.06 to \$10.29, New York or Brooklyn.

Old Material.—Dealers report a slightly smaller tonnage of scrap offered at present prices, but no scarcity of material seems to be in prospect. Prices on all grades show practically no change, except that on the basis of a recent sale of heavy breakable cast to a Coatesville, Pa., consumer, dealers are offering \$13.50 per ton, delivered, while others are quoting \$14 per ton, delivered to a Harrisburg, Pa., mill. No. 1 heavy melting steel has been bought by the consumer at Sparrows Point, Md., at \$12.50 per ton, delivered. Bids on the list of the Pennsylvania Railroad, offering about 40,000 tons, are to be opened this week.

Dealers' buying prices per gross ton, f.o.b. New York:

No. 1 heavy melting steel.	\$9.00 to	\$9.85
Heavy melting steel (yard)	6.00 to	6.25
No. 1 hvy. breakable cast.	9.75 to	10.00
Stove plate (steel works)...	6.75 to	7.25
Locomotive grate bars....	6.75 to	7.25
Machine shop turnings....	6.00 to	6.50
Short shoveling turnings..	6.00 to	6.50
Cast borings (blast furn. or steel works).....	6.00 to	6.50
Mixed borings and turnings	6.00 to	6.50
Steel car axles.....	14.50 to	15.00
Iron car axles.....	23.50 to	24.00
Iron and steel pipe (1 in. dia., not under 2 ft. long)	8.25 to	8.75
Forge fire	6.50 to	6.75
No. 1 railroad wrought....	9.00 to	9.50
No. 1 yard wrot., long....	7.50 to	8.00
Rails for rolling.....	10.00 to	10.50
Cast iron carwheels.....	11.00 to	11.50
Stove plate (foundry)....	8.25 to	8.75
Malleable cast (railroad).....		10.00
Cast borings (chemical)...	10.75 to	11.25

Prices per gross ton, deliv'd local foundries:

No. 1 machy. cast.....	\$14.00 to \$15.00
No. 1 hvy. cast (columns, bldg. materials, etc.), cupola size	12.00 to 13.00
No. 2 cast (radiators, cast boilers, etc.)	11.50 to 12.50

menting on the fact that the movement of iron to consumers is better than usual for this time of the year. Shipments in July were slightly larger than those in June and exceeded output. In fact, stocks on hand at district furnaces have been cut down considerably. Sales in the past week by Cleveland interests totaled approximately 40,000 tons, an increase of about 14,000 tons over the previous week. Pending business is of fair volume, the most important inquiry calling for 3200 tons of foundry iron for delivery over the remainder of the year to an Indiana consumer. As a result of the improvement in buying and of shipments, prices have assumed a firmer tone, although no actual changes have occurred. In Michigan, a larger number of orders have been booked at \$18, although the bulk of the tonnage is still being taken at \$17.50. For delivery to highly competitive points a strengthening of quotations is reported, the minimum price now being \$16.25, furnace.

Prices per gross ton at Cleveland:

N'th'n fdy., sil. 1.75 to 2.25.....	\$18.00
S'th'n fdy., sil. 1.75 to 2.25.....	\$21.50
Malleable	18.00
Ohio silvery, 8 per cent.....	28.00
Basic Valley furnace.....	16.00
Stand. low phos., Valley furn.....	26.50

Prices, except on basic and low phosphorus, are delivered Cleveland. Freight rates: 50c. from local furnaces; \$3 from Jackson, Ohio; \$6 from Birmingham.

Warehouse Business.—Local jobbers have announced a reduction on galvanized and black sheets of \$3 and \$7 a ton respectively, the new schedule to become effective immediately. Otherwise, prices are being well maintained. The volume of business in the past week has been only moderate, but has been distributed among all products.

Sheets.—There has been a recession in fresh orders and in specifications during the past 10 days. The lull in buying is traceable largely to the slackened demand from the automobile industry. Many companies are bringing out new models, but will not get into sizable production for a short time and under the circumstances the release of more liberal specifications by companies in the automotive field probably will not materialize for a few weeks at least. Purchases by other consumers also have been light. The falling off in bookings has not affected prices, which are firmer. Black sheets are quoted at 2.65c., Valley, or 2.60c., Pittsburgh, while blue annealed stock ranges from 1.90c. to 2c., Pittsburgh, with most orders be-

Cleveland

July Steel Business Gains and Exceeds That of June—One Sheet Mill Advances Prices

CLEVELAND, July 31.—The last week of July has brought further improvement in bookings of heavy steel products, with the result that the volume of business in the past month exceeded that of June by a small percentage and that of July, 1927, by a comfortable margin. The betterment is reflected in an increasing tone of optimism which pervades the market. The general sentiment is that activities are being carried along at a rate somewhat above normal for midsummer and expectations are that the present liberal run of specifications and orders is a forerunner of a satisfactory movement of steel in the fall. The wide distribution of bookings among consuming industries is interpreted as an indication of well-sustained operations in many different lines.

While prices are showing a firmer tendency, bars, shapes and plates have by no means been established on a basis of 1.90c., Pittsburgh. A considerable number of current orders are being placed at that figure, but most contract customers are covered for this quarter at 1.85c., and in some cases contracts originally made at 1.90c. have been revised recently to the lower schedule. Plates still can be obtained at 1.85c., Pittsburgh, which is being rather widely quoted. Steel bars range from 1.85c. to 1.90c., Cleveland.

Almost without exception steel orders have called for small lots for immediate delivery. Building activities continue quiet, the only large jobs which have appeared being the new building for Lakeside Hospital, Cleveland, requiring 4000 tons of structural steel, and a structure in Detroit for the Bell Telephone Co., for which 1040 tons will be needed.

In pig iron the week was notable in that sales were the largest since early in April.

Pig Iron.—The situation is more encouraging to producers, who are com-

No. 9 ann'd wire, per 100 lb.....	\$2.85
No. 9 gal. wire, per 100 lb.....	3.30
Com. wire nails, base per keg.....	2.85

*Net base, including boxing and cutting to length.

ing placed at the lower figure. Galvanized sheets remain at 3.40c., Pittsburgh, and 3.45c., Valley. An important sheet maker has advanced black to 2.85c. and blue annealed to 2.10c., Pittsburgh, although in both cases it is offering pickled grades at \$2 a ton less.

Cold-Finished Steel Bars.—Mills are booking a moderate amount of business from companies in the automotive industry. The price is steady at 2.15c., Cleveland.

Strip Steel.—Consumers continue to specify rather meagerly against current contracts and fresh orders have been poor in volume. Quotations on hot-rolled strips average 1.75c., Pittsburgh, on wide material. Mills are reported to be selling cold-rolled strip at 2.65c., Cleveland, for 3 tons or more. Fender stock is unchanged at 4.10c.

Wire Products.—A slight improvement in buying is noticed, although current business reflects only a fair demand from consuming industries. Prices are showing signs of firmness.

Reinforcing Bars.—The Lakeside Hospital, this city, will require a considerable tonnage of bars, but the amount has not yet been computed. Rail steel bars are firm at 1.75c., mill.

Coke.—Consumers are accepting a fair amount of by-product foundry coke on present contracts, but forward buying is practically at a standstill, buyers preferring to confine orders to cover immediate needs only. Ohio by-product foundry coke is unchanged at \$7.75, Painesville, while Connellsville foundry coke remains at \$3.50 to \$4.85, ovens.

Semi-Finished Steel.—While forward buying of sheet bars is negligible, specifications on third quarter contracts have been satisfactory.

Quotations continue firm at \$32 to \$33, Cleveland, for sheet bars, billets and slabs.

Bolts, Nuts and Rivets.—Shipments to contract customers have been sustained at a fairly high level, a considerable percentage of the business having come from agricultural implement makers and from jobbers. Prices are steady and unchanged.

Old Material.—Steel plants have increased specifications against present contracts, so that the amount of material being shipped to consumers is of fair proportions. Local dealers are buying only enough tonnage to cover present contract obligations. Blast furnace grades are somewhat active, but foundry items are quiet. There is a good demand for machine shop turnings. Prices of several items have weakened, although quotations in general are fairly firm.

Prices per gross ton delivered consumers' yards:

Basic Open-Hearth Grades

lines of steel commodities was four-months' notes without interest and 3 per cent for cash in 30 days. During the panic of 1893 a discussion came up regarding these terms because the steel companies were acting practically as bankers and could not afford to carry this large line of credit. The terms were then changed for many steel products to 30 days net or 2 per cent off for cash in 10 days.

"This present method of cash discount is a carryover from those earlier periods when trade and economic conditions were quite different from what they are today. For instance, goods were a long time in transit, money fluctuated, credit information was very incomplete and funds were scarce. An attractive cash discount was therefore offered by the seller to hasten payment, but today that condition is reversed; money is stable and rapidly available, deliveries are quick and there is abundant credit information.

"Manufacturers of sheets and strips are no longer justified in offering a 2 per cent cash discount for payment in 10 days and the new terms of ½ of 1 per cent simply apply the practice which has already been established among manufacturers of hot-rolled strips, shapes, plates, bars and other iron and steel products. Thirty-day terms of sale are now practically standard in the steel industry. A 2 per cent cash discount in 10 days is equivalent to a rate of 36 per cent a year. With existing money rates this is out of reason.

"The manufacturer of sheets and strips is justified in paying a cash discount rate that is somewhere near the market value for funds at this time. Under the announced policy of ½ of 1 per cent we will be paying the equivalent of 9 per cent per annum."

Cash Discount Reduced on Sheets

American Rolling Mill Co. Announces New Rate of ½ of 1 Per Cent for Cash in 10 Days

THE American Rolling Mill Co. has announced that, effective from Oct. 1, next, the cash discount on sheets will be reduced from 2 per cent in 10 days to ½ of 1 per cent. This action probably will be followed by other sheet makers and a similar reduction in the allowance for prompt payment of invoices on cold-rolled strips is expected to become effective on the same date. Thus there will be only three steel products on which the inducement to pay by the tenth of each month will be more than ½ of 1 per cent. These are tubular goods, tin plate and wire products.

On nails and some other wire products, the discount is 2 per cent in 10 days and net in 60 days, while on woven wire fence, which has spring and fall datings, the discount amounts to as much as 4 per cent for early payment. Since consumers of tin

plate are largely under cover for the remainder of this year and the contracts call for 2 per cent off for payment in 10 days following receipt of invoice, no reduction in the discount is probable this year, but it is likely that on first quarter and first half of 1928 business, tin plate and sheets will again have a common discount. The cash discount on pipe also is 2 per cent.

Easier Money Makes Lower Cash Discount Necessary

Commenting on the change announced by the American Rolling Mill Co., an officer of a large sheet manufacturing company said:

"During the period following the Civil War a large cash discount was offered by the seller; in the early eighties and nineties the standard terms of payment for many general

Bulgarian Metal Working Plants Hold Convention

BERLIN, GERMANY, July 14.—A convention of the Bulgarian metal industries, held recently at Sofia, agreed upon the creation of an Association of Bulgarian Metallurgical Companies. It was further decided to urge official measures for encouragement of the domestic machinery manufacturers. It was pointed out at the meeting that the domestic machinery builders have so far developed as to be able to meet most of the Bulgarian requirements. Output of agricultural machinery in the past year is reported at 110,000,000 lewas. Acting through the Bulgarian National Bank, the Government arranged the sale of these machines in Bulgaria at greatly reduced prices and deferred payments. At the conference it was brought out that tractors are the only agricultural machines not produced within the country. A petition is to be presented to the Government requesting the delay of proposed large agricultural machinery orders until the home industry has had an opportunity to modernize plants.

Canada

Demand for Structural Steel and Reinforcing Bars Features Business Across the Border

TORONTO, ONT., July 31.—Canadian manufacturing plants are turning out in physical volume approximately 140 per cent of the output reached at the peak of war-time activity 10 years ago, and in spite of lower prices their products have a gross value over 20 per cent higher. The value for 1927, was recently stated to be in the neighborhood of \$3,500,000,000, or about \$250,000,000 above the figures for 1926. This constitutes a record in the history of the country and indicates the extent to which Canada has shared in the general industrialization of non-European countries since the war.

While considerable improvement in industrial activity has featured business in this country, still greater strength along this line is expected. At the moment it is felt that not only are the Canadian railroads reaching a point where it will be necessary for them to embark upon a large scale program of rolling stock improvement, but that also the quite extensive branch line undertakings now in hand by the railroads and others still in project will result in a necessity for large additions to rolling stock. In the meantime, several of the Canadian companies producing rolling stock and other railroad equipment have had under active organization and development new manufacturing departments which are having the result of not only diversifying their production, but making them less dependent upon a single source of business.

As an example, the Canadian Car & Foundry Co., among other things, is developing a substantial business in the pressing of frames for automobiles. The National Steel Car Co. is working on several new lines. The Canadian Bronze Co. has been adapting its production to meet the needs of certain industries, such as newsprint. The Canadian Locomotive Co. has been showing activity in the direction of mining machinery. These new departments promise to register growth over the next few years and should the expected improvement in rolling stock demands materialize, they will benefit accordingly.

Pig Iron.—A majority of melters who place quarterly contracts are covered up to the end of September, so advance buying of foundry and malleable pig iron has practically ceased. Spot sales, however, are holding up well, buying at the moment being at the high average for the year, and decidedly better than that of July a year ago. Consumers who are situated to take delivery of iron by water are favoring this method of transportation and are placing spot orders for as high as 500 tons. Prices remain unchanged in the Toronto market.

Prices per gross ton:

Delivered Toronto	
No. 1 fdy., sil. 2.25 to 2.75.	\$23.10 to \$23.60
No. 2 fdy., sil. 1.75 to 2.25.	23.10 to 23.60
Malleable	23.10 to 23.60
Delivered Montreal

Malleable	24.50 to 25.00
Basic	23.50 to 24.00
Imported Iron, Montreal Warehouse	
Summerlee	33.50
Carron	33.00

Structural Steel.—The demand for structural steel and reinforcing bars continues one of the features of the iron and steel industry of this country. Numerous orders have been closed for structural in lots ranging from 100 to 1000 tons and sizable tonnages are pending. For the new knitting mills at Hamilton, Ont., for J. R. Moddie & Sons, Ltd., 500 tons of reinforcing bars and 1500 tons of structural steel will be required. The Canada Permanent Mortgage Corporation, Toronto, will erect an office building at Bay and Adelaide Streets, for which approximately 7000 tons of structural steel will be required. Inquiries are out

for other proposed buildings, involving from 500 to 3000 tons, which are expected to be closed within the next two or three weeks.

Old Material.—Business in the scrap market remains quiet. Consumers are buying in small tonnages and only for immediate needs. Shipments of steel scrap into the Hamilton, Ont., district is a feature of the market, but little new buying is being done. Consumers throughout Ontario are ordering machinery cast and stove plate in limited tonnages. Prices are again showing a softening tendency, especially in the local market.

Dealers' buying prices:

	Per Gross Ton	
	Toronto	Montreal
Heavy melting steel....	\$9.00	\$7.00
Rails, scrap	10.00	9.00
No. 1 wrought	9.00	11.00
Machine shop turnings..	7.00	5.00
Boiler plate	7.00	6.00

Standard carwheels	16.00	16.00
Malleable	13.00	13.00
Per Net Ton		
No. 1 machinery cast....	15.00	
Stove plate	9.00	
Standard carwheels	13.00	
Malleable scrap	13.00	

St. Louis

Demand for Galvanized Sheets Improves—Tin Plate Active—Pig Iron Business Quiet

ST. LOUIS, July 31.—Sales of pig iron were rather light during the week, the St. Louis Gas & Coke Corporation getting 2000 tons, including 800 tons sold to an Illinois stove manufacturer and 200 tons to a northern Illinois melter and the remainder in lots of a carload or more. The insistence on immediate shipment of all orders is regarded as pointing to low stocks and consequent early buying. Business with stove foundries is reported to be better than usual at this time of year, and the melt of agricultural implement makers is being well sustained. The Granite City

maker has reduced its price to \$18.50 to \$19, f.o.b. furnace, and continues to meet competition from other makers of Northern iron. No inquiries for sizable tonnages are pending.

Prices per gross ton at St. Louis:

No. 2 fdy., sil. 1.75 to 2.25' f.o.b.	
Granite City, Ill.	\$18.50 to \$19.00
N'th'n No. 2 fdy., deliv'd St. Louis.	19.66
Southern No. 2 fdy., deliv'd	19.92
Northern malleable, deliv'd	19.66
Northern basic, deliv'd	19.66

Freight rates: 81c. Granite City to St. Louis; \$2.16 from Chicago; \$4.42 from Birmingham.

Coke.—The usual summer dullness pervades the market for both domestic and foundry grades of coke, with no changes in prices. Not much activity is expected from dealers for the next few weeks, at least.

Finished Iron and Steel.—A marked improvement with respect to galvanized sheets was shown during the last week, according to the Granite City Steel Co. Incoming business was extremely satisfactory, the volume being sufficient to warrant operations virtually at capacity. Reports from various district offices in the South and Southwest indicate that a major buying movement is at hand. Sheet mill and tin mill business continues good, all units operating 100 per cent, or as close thereto as the summer heat will permit. Tin plate is in good demand, with prospects of continuing so for several months. Blue annealed sheets are not quite so

Warehouse Prices, f.o.b. St. Louis

	Base per Lb.
Plates and struc. shapes	3.25c.
Bars, soft steel or iron	3.15c.
Cold-fin. rounds, shafting, screw stock	3.75c.
Black sheets (No. 24)	4.45c.
Galv. sheets (No. 24)	5.25c.

Boiler rivets	3.75c.
Per Cent Off List	
Tank rivets, 7/8-in. and smaller, 100 lb. or more	70
Less than 100 lb.	65
Machine bolts	60
Carriage bolts	60
Lag screws	60
Hot-press. nuts, sq., blank or tapped, 200 lb. or more	60
Less than 200 lb.	50
Hot-press. nuts, hex., blank or tapped, 200 lb. or more	60
Less than 200 lb.	50

active as other items, although improved. Prices are steady, with a tendency toward stabilization. July warehouse business probably will show a falling off of about 15 per cent as compared with last month and July, 1927, which is largely due to the decrease in buying in the oil fields. The St. Louis industrial district demand holds up fairly well. The only structural job of consequence—825 tons for a terminal depot for the American Railway Express Co.—went to the Mississippi Valley Structural Steel Co.

Old Material.—The market for old material is extremely quiet. Consumers are showing little interest in the market, and it is not expected there will be any buying until the latter part of August. Dealers are buying from railroad lists to cover the few unfilled contracts. Railroad lists include: Pennsylvania, 43,565 tons; Union Pacific, 1990 tons; Big Four, 1400 tons; Standard Oil of Indiana,

110 tons; Missouri Pacific, 105 carloads; Chicago, Milwaukee & St. Paul, 167 carloads; Nickel Plate, 31 carloads and Frisco Lines, 17 carloads.

Dealers' buying prices, per gross ton, f.o.b. St. Louis district:

Heavy melting steel.....	\$10.50 to \$11.00
No. 1 locomotive tires....	12.00 to 12.50

Relay. rails, 70 lb. and over	26.50 to 29.00

see company is operating six at Ensley and six at Fairfield and the Gulf States Steel Co., three at Alabama City.

Cast Iron Pipe.—The market has been quiet and below normal for the past three weeks. New business is confined to small orders and the tonnage booked outside of the district is very light. Plant operations are at a fair level due to accumulation of small orders. Shipments have been fairly steady through July. Makers are holding closely to quotations of \$34 to \$35 for third quarter delivery.

Coke.—Demand for foundry coke continues light, reflecting midsummer conditions. Coke under contract is moving out at a fairly steady rate, though the total volume for July is somewhat less than that of June. The \$5 quotations for both spot and contract are unchanged.

Old Material.—The market has developed a better feeling than has been found for several weeks. Demand is somewhat stronger in nearly all lines, but sales are unusually light. Scrap steel rail and No. 1 cast are holding first place in the amount of activity. Prices are low and unchanged.

Prices per gross ton, deliv'd Birmingham dist. consumers' yards:

Heavy melting steel.....	\$8.50 to \$9.00
Scrap steel rails.....	11.00 to 11.50
Short shoveling turnings..	7.50 to 8.00

Birmingham

Galvanized and Black Sheets Reduced \$1 a Ton—Pig Iron Demand Steady

BIRMINGHAM, July 31.—Pig iron melters prefer to carry light stocks and are demanding quick deliveries. Pending business is largely confined to small lots, but sales have improved noticeably during July. The market is firm at \$15.50. Some iron is being sold for September delivery, but a portion of the third quarter requirements is yet to be placed. Shipments by merchant producers have been ahead of the make for the past several days. This has been aided by reduced production due to pending furnace repairs by one company. Makers of cast iron pressure pipe, radiators and heavy machinery are among the heavy users. No changes in furnace operations have been made during the past week. Seventeen furnaces are in blast, eight being on foundry, seven on basic, one on recarburizing iron and one on ferromanganese.

Prices per gross ton f.o.b. Birmingham dist. furnaces:

No. 2 fdy., 1.75 to 2.25 sil.	\$15.50
No. 1 fdy., 2.25 to 2.75 sil.	16.00
Basic	\$15.00 to 16.00

Finished Steel.—Demand for steel bars, shapes and plates continues steady and above the average for this season of the year. New business booked during July was heavier than that of the same month last year and showed a slight gain over that of June. Prices on bars, plates and shapes show a tendency toward greater stability. Quotations on galvanized and black sheets have been reduced \$1 a ton. Mill operations in the district were increased slightly during the past week. Railroad accessory buying is slack. Business is quieter with structural steel fabricators and bar manufacturers. The

Virginia Bridge & Iron Co. has received an order from the Alabama Power Co. for 600 tons of structural steel for a power house. Open-hearth operations have been the same during the past two weeks; the Tennes-

Youngstown

Ingot Production Close to 80 Per Cent—Most Finished Products Doing Well

YOUNGSTOWN, July 31.—If July ingot production of this district is less than that of the month before, it will be only a trifling decrease and will be chargeable largely to the limited rate of finishing mill operations and the consequent slowing up of steel production in Fourth of July week. Plant engagement since has been on a rising scale and today finds ingot output at close to 80 per cent of capacity.

The Republic Iron & Steel Co. has 12 of its 13 open-hearth furnaces in Youngstown in production, while all eight of the furnaces at its Warren works are melting. The Youngstown Sheet & Tube Co. has in operation all of its open-hearth furnaces at Campbell and five at its Brier Hill works, or 17 out of a total of 24 at both plants. The Sharon Steel Hoop Co. is operating four of its six furnaces at Lowellville. The total of active independent open-hearth units is 41 out of a total of 53. Bessemer production is rather low, with Republic Iron & Steel Co. operating only one converter on a single turn daily. The rate of output of the Carnegie Steel Co. in this district is well up to the average of the independent companies. This company recently took off furnaces

for repairs at its Ohio works and at its Farrell, Pa., works, but the Ohio works furnace again is in blast. Of the 26 steel works blast furnaces in the Mahoning and Shenango Valleys, 17 are producing iron.

Of the finished steel products of the district, only nails and wire are having an unsatisfactory sale. Steel bars are doing well and business in sheets is active enough to encourage producers to take a stronger price stand. In addition to the liberal amount of pipe line tonnage that came to this district in the latter part of June and the fore part of July, producers have been getting a little more oil country pipe business, and the demand for building and construction pipe is steady, though individual orders are small. There is little complaint as to

the demand for strips, but there is as to the prices at which they are selling.

There have been few periods in the history of tin plate when demand was better than it is now. The American Sheet & Tin Plate Co. has all of its tin mills in the Shenango Valley in operation and has found it necessary to work an extra turn to bring up the production, somewhat impaired by the fact that the mills' crews have been unable to stand up under the heat inside and outside the plants.

It is small wonder that, enjoying such a good business and plant operation at this time of the year, steel makers view the situation optimistically.

The Republic Iron & Steel Co. has advised its district offices that shortly it will complete changes in its old 20-in. skelp mill and use it as a mill

warehouse, in which will be carried a stock of merchant steel bars, bar mill angles and light channels and concrete reinforcing bars. It is stated that the establishment of this mill warehouse does not mean the company intends to enter the warehouse steel business, but having been handicapped in making promises of deliveries by reason of having no rollings scheduled, the warehouse stocks will be available and shipments can be made without the former dependence upon mill rolling schedules. Carload shipments from the warehouse will take the mill shipment prices, but on less than carload lots there is a minimum extra charge of \$5 a ton. The company plans to stock the 10 sizes of concrete reinforcing bars in 60-ft. lengths, but no fabricating or bending of them is to be attempted.

independent companies have quoted as low as 2.20c.

Shapes.—Although shape awards totaled less than 700 tons this week, pending business amounts to more than 12,000 tons, several large projects having come out for figures during the past few days. The Western Iron Works took 165 tons for an apartment in San Francisco. Bids will be opened Aug. 15 for 1400 tons for four sheds on pier 45, San Francisco, and bids are now being taken on 450 tons for a hotel in San Francisco. Claude Fisher, Los Angeles, was low bidder on the Bardsdale bridge at Ventura, Cal., calling for 570 tons. No change in the price of plain material has occurred, 2.35c., c.i.f. coast ports, being firm.

Cast Iron Pipe.—Awards so far this year are considerably below the total for the corresponding period last year. The Southwest Paving Co., Los Angeles, received the only large award of the week. This was 133 tons of 6 to 10-in. class B pipe for the improvement of El Centro Street in South Pasadena, Cal. Sierra Madre, Cal., voted bonds for a water system and bids will be called for shortly for 1053 tons of 4 to 16-in. class B pipe. The Monterey Water Co., Monterey, Cal., is taking bids on 530 tons. Compton, Cal., will open bids on Aug. 7 for 148 tons of 2 and 4-in. class B pipe, and Dallas, Tex., will open bids on Aug. 10 for 23,247 tons of 16 to 36-in. classes B and C pipe, with alternate bids on steel and concrete pipe. The Weyerhaeuser Timber Co., Longview, Wash., will shortly come into the market for 1503 tons of 4 to 12-in. class C pipe.

Standard Pipe.—Demand for both oil country goods and standard steel pipe has been limited to exceptionally small lots. Los Angeles has opened bids on 100,000 ft. of 1-in. extra heavy galvanized pipe and will make an award next week.

Coke.—Both inquiries and sales of foundry coke have been confined to small lots for prompt shipment, stock in foundry yards being sufficient to take care of present requirements.

San Francisco

Structural and Reinforcing Steel Demand Continues Active —7200 Tons of Plates Needed for Pipe Lines

SAN FRANCISCO, July 28 (*By Air Mail*).—During the past week a lull has occurred in demand for most forms of finished steel, although reinforcing steel bars and structural shapes continue active. Important new projects include 1400 tons of structural shapes for four sheds at pier 45, San Francisco; 7200 tons of plates for small-sized pipe lines for Oakland's municipal utility district and more than 23,000 tons of cast iron pipe for Dallas, Tex. The largest award of the week was 260 tons of shapes for a bridge at Benson, Ariz., booked by the Virginia Bridge & Iron Co.

Pig Iron.—The only inquiry of importance is for 400 tons for the Puget Sound Navy Yard. Little or no improvement is noticed in the rate of operations among jobbing foundries, which comprise the bulk of the plants on the coast, and as a result both sales and inquiries have been limited to small lots. Prices are unchanged.

Prices per gross ton at San Francisco:

*Utah basic	\$25.00 to \$26.00
*Utah fdy., sil. 2.75 to 3.25	25.00 to 26.00
**Indian fdy., sil. 2.75 to 3.25	24.00 to 25.00

*Delivered San Francisco.

**Duty paid, f.o.b. cars San Francisco.

Bars.—Out-of-stock prices in the bay district are firmer than in months, and while 2c. is shaded occasionally the tendency is to hold to this level, which is only a few dollars a ton higher than mill prices for reinforcing material. The largest award went to the Pacific Coast Steel Co. and involved 300 tons for two Seattle projects. Several large jobs have come out for figures, including 460 tons for

a storm drain at Culver City, Cal., 1500 tons for an apartment in Los Angeles and 300 tons for a power house in San Francisco.

Plates.—Demand for plates is quiet and only two projects of more than 100 tons are up for figures. The largest of these involves 7200 tons of 5/16 to 3/8-in. material for water mains in Oakland, bids on which will be opened Aug. 17. The Navy Department will open bids Aug. 7 for 131 tons for the Puget Sound Navy Yard. Practically all large producers are now quoting 2.25c., c.i.f., and some of the smaller

Boston

Pig Iron Market Dull as Most Consumers Are Covered for This Quarter—Scrap Quiet

BOSTON, July 31.—Not much pig iron business was done in the past week. Sales included Mystic, Buffalo, eastern New York State, western Pennsylvania and Alabama irons in small tonnages, with an aggregate of not more than 3000 tons. Buying for third quarter is practically over and most foundries have enough iron on hand or on order to last well into the fourth quarter. A large consumer has intimated to sellers that it will be in the market for a substantial tonnage late in August. The Universal Winding Co., Providence, R. I., is calling for bids on 500 tons of No. 2X

and 500 tons of No. 1X, deliveries to run from September through December. So far as prices go, it is still a buyer's market.

Foundry iron prices per gross ton deliv'd to most New England points:

*Buffalo, sil. 1.75 to 2.25 ..	\$20.91 to \$21.41
*Buffalo, sil. 2.25 to 2.75 ..	21.41 to 21.91
†Buffalo, sil. 1.75 to 2.25 ..	19.78 to 20.28
†Buffalo, sil. 2.25 to 2.75 ..	20.28 to 20.78
East. Penn., sil. 1.75 to 2.25 ..	23.15 to 23.65
East. Penn., sil. 2.25 to 2.75 ..	23.65 to 24.15
Va., sil. 1.75 to 2.25	25.71
Va., sil. 2.25 to 2.75	26.21
Ala., sil. 1.75 to 2.25	22.41 to 24.27
Ala., sil. 2.25 to 2.75	22.91 to 24.77

Freight rates: \$4.91 all rail and \$3.78 rail and water from Buffalo; \$3.65 from eastern Pennsylvania; \$5.21 all rail from Virginia; \$6.91 to \$8.77 from Alabama.

*All rail rate. †Rail and water rate.

Warehouse Prices, f.o.b. San Francisco

Base per Lb.

Plates and struc. shapes	3.15c.
Soft steel bars	3.15c.
Small angles, 3/8-in. and over	3.15c.
Small angles, under 3/8-in.	3.55c.
Small channels and tees, 3/4-in. to 2 3/4-in.	3.75c.
Spring steel, 1/4-in. and thicker ..	5.00c.
Black sheets (No. 24)	4.95c.
Blue ann'l'd sheets (No. 10)	3.90c.
Galv. sheets (No. 24)	5.50c.
Struc. rivets, 1/2-in. and larger	5.65c.
Com. wire nails, base per keg	\$3.40
Cement c'd nails, 100-lb. keg	3.40

Coke.—The New England Coal & Coke Co. and the Providence Gas Co. announce that the price of by-product foundry coke on contract shipments during August will remain at \$11 a ton, delivered within a \$3.10 freight rate zone. These ovens shipped more foundry coke in July than in any previous month this year. Despite the increase, the New England melt of iron is not more than 65 per cent of capacity and in all probability nearer 60 per cent, owing to the small melt by textile machinery makers. A little Connellsville foundry coke is moving into New England at \$5 a ton, ovens, or \$10.54, delivered in box cars, and at \$10.29 a ton, delivered in open cars.

Bars.—Consumption of steel bars is holding up well and running ahead of last year. The market is firm at 1.90c., base Pittsburgh. There is more stability in prices of reinforcing bars than in months, notwithstanding the keen competition for the small amount of business. The mill price now appears firm at 1.90c., base Pittsburgh, and the delivered price at \$2.26½, common Boston freight rate points, while the warehouse price is 2.90c., base.

Old Material.—Most of the activity in old material centers in the export market. A steamer is loading 3500 tons of scrap for shipment to Italy, and another boat will shortly begin loading 4000 to 5000 tons for shipment to Danzig. Exporters are still paying \$9.25 a ton, on dock, for No. 1 steel and \$8.75 for No. 2. Prices on material for domestic consumption are unchanged. They are unattractive to owners of material, consequently little scrap is moving. One or two dealers heretofore offering \$5 to \$5.50 a ton, on cars shipping point, for mixed borings and turnings, have dropped to \$4.50 to \$5, but others are holding to \$5 to \$5.50. New England foundries

Detroit

Automobile Production at High Rate—Employment Shows a Gain of 5000 in Past Week

DETROIT, July 31.—The so-called midsummer slump has not greatly affected the metalworking industry in this area, owing chiefly to the manner in which automobile production schedules have been holding up. As a matter of fact, the past week showed an increase of 5001 men on the report of the Employers' Association. The companies included in this report employ about two-thirds of the city's working population. The total this week is 270,557, or 68,563 more than the corresponding figure for 1927.

The final figures on Chevrolet output for the first six months of this year total 751,536 units, compared with 607,749 units for the same period of 1927. The final figures for June are 132,794 for the current year and 112,794 for June, 1927. It is estimated that both Chevrolet and Buick will have record outputs for the third quarter.

Chrysler is shipping about 1200 units a day. The original Chrysler schedule for the third quarter was set at 86,000 units, but has been revised to include an additional 500 units a day for the new Plymouth line. Including the third quarter production, the total output for Chrysler will exceed the 1927 figure of 192,000 cars, which up to that time was a record.

Dodge Brothers, Inc., showed shipments of 121,327 units up to June 30. This compares with 107,115 units for the same period of 1927. The gain is 13.3 per cent.

The Graham Paige Motors Corporation, with approximately 44,000 units, has more than doubled its entire output of 1927. Additional factory facilities now under way will increase capacity from 400 cars to 600 cars per day. These changes will include the erection of new buildings

and the installation of new equipment at both the main plant and the body plant at Wayne. These additions represent about \$700,000 for construction and equipment. This company has also purchased a group of buildings at Fort and McKinstry Streets, with 262,000 sq. ft. of floor space, to house the service and export shipping departments previously quartered at the main plant.

Output for the Willys Overland Co. is running about 1500 cars per day, 1100 of which are the Whippets. Production lines are going five and a half days a week on a two-shift basis. Parts manufacturing is partly on a three-shift basis. This company has let a \$250,000 contract for an addition to the new export building, which was completed only two months ago.

General Motors Corporation shows total production for the first six months of 1,083,316 units, compared with 883,477 for the same period of 1927.

The Hudson Motor Car Co. has just put into operation a new \$1,000,000 plant for lacquering and metalworking.

Paul G. Hoffman, vice-president Studebaker Corporation, states that retail deliveries have increased from 40 to 50 per cent since the introduction of the new model two weeks ago.

Shipments of pig iron in the district are considerably above those of June. August promises to continue at the present rate.

There is very little activity in the scrap market. Prices are unchanged.

Buffalo

Good Volume of Small-Lot Pig Iron Buying

BUFFALO, July 31.—Small-lot pig iron business has been brisk. There has been no large tonnage buying during the past 10 days, but there have been enough sales of lots up to 500 tons to make up a good volume. Inquiry is small, but includes one lot of 1000 tons. July shipments were greater than production, but the movement shows a tendency to slow up a little now. Buffalo sellers quote iron for local delivery on a \$17 base for foundry and \$17.50 for malleable.

Prices per gross ton, f.o.b. furnace:	
No. 2 fdy., sil. 1.75 to 2.25.....	\$17.00
No. 2X fdy., sil. 2.25 to 2.75.....	17.50

Cincinnati

Pig Iron Demand Better—Steel Sales in Good Volume

CINCINNATI, July 31.—Pig iron prices are unchanged in this market, with demand slightly better and prospects brighter. In the past few days one company has sold a 500-ton lot and another lot of 250 tons of Northern iron, both going to southern Ohio consumers. A few smaller orders have been taken by local firms, the week's sales totaling about 2000 tons. Some inquiries have been received, the largest for 3000 tons covering the requirements for the rest of the year of the Marmon Motor Car Co.; Northern iron is specified. A few small inquiries are under consideration, mostly for prompt delivery.

Prices per gross ton, deliv'd Cincinnati:

So. Ohio fdy., sil. 1.75 to 2.25	\$19.89
So. Ohio malleable	\$20.14 to 20.89
Ala. fdy., sil. 1.75 to 2.25	19.19
Ala. fdy., sil. 2.25 to 2.75	19.69
Tenn. fdy., sil. 1.75 to 2.25	19.19
So'th'n Ohio silvery 8 per cent	26.89

Freight rates, \$1.89 from Ironton and Jackson, Ohio; \$3.69 from Birmingham.

Finished Material.—Small-lot buying of bars, structural shapes and plates continues in fair volume and specifications against third quarter contracts have been about normal. Operations among consuming industries are being sustained on a higher

plane than usual for this time of the year, so that producers are predicting that the mid-summer recession in orders will scarcely be discernible. Prices of heavy steel products are being maintained at 1.90c., base Pittsburgh. Structural steel in this district is still devoid of features, although fabricating shops are moderately well engaged on numerous small jobs. The nail and wire market has recovered somewhat from the depression created by the lack of interest on the part of consumers, sales having been the best in four weeks. Common wire nails are quoted at \$2.55 per keg, Ironton, plus a barge rate for delivery to Ohio River points. Sheet mills have booked impressive tonnages during the past two weeks, so that incoming business has been considerably ahead of that in July, 1927. Meanwhile, production has been kept at about 90 per cent of capacity. Prices are still a cause of concern to manufacturers. Galvanized sheets for roofing purposes have been selling at 3.30c. to 3.40c., base Pittsburgh, in the South, with 3.50c. prevailing in a few cases. Blue annealed ranges from 1.90c. to 2c., and black sheets are bringing from 2.60c. to 2.70c.

Warehouse Business.—Jobbers booked about 5 per cent less business in July than in June, the decline having been caused by seasonal conditions. Structural steel is in better demand and bars continue active. Prices are unchanged.

Coke.—Coke movement is very little better. Indications are that July movement will be slightly below that of June, the percentage, however, being very slight.

Foundry coke prices per net ton deliv'd Cincinnati: By-prod. coke, \$9.02; Wise County coke, \$7.09 to \$7.59; New River coke, \$9.09 to \$9.59. Freight rates, \$2.14 from Ashland, Ky.; \$2.59 from Wise County and New River ovens.

Old Material.—The scrap market is looking slightly better; some sales are noted and some inquiries are under consideration. A sale of 2000 tons borings and turnings to a nearby blast furnace was at unchanged prices. Business is slowing down, as it usually does when rail offerings are reported. The Big Four offers only 1200 tons, closing July 31, but the Pennsylvania has approximately 50,000 tons to close Aug. 1, the New York

Warehouse Prices, f.o.b. Cincinnati

Base per Lb.

Railroad malleable	11.50 to 12.00
Agricultural malleable	10.50 to 11.00

Obituary

WALDO G. LUNGER, formerly western manager for the Union Twist Drill Co., Athol, Mass., with headquarters at Chicago, died on July 27 at Rome, N. Y., where he had resided since ill health forced his retirement some time ago. He was a graduate in mechanical engineering from the Stevens Institute of Technology, Hoboken, N. J.

EDGAR EVERETT STARK, hydroelectric engineer, died July 26 while addressing a Rotary Club luncheon at Poultney, Vt. He was 64 years of age, and Painesville, Ohio, was his birthplace. After graduation from the Case School of Applied Science, Cleveland, in 1882, he worked for several years with the Brush Laboratories, Cleveland, owned by Charles F. Brush, inventor of the arc light. In 1903 he moved to New Zealand and in the succeeding 18 years he built hydroelectric systems in various parts of Australia.

JAMES McNAUGHTON, vice-president Baldwin Locomotive Works, in charge of its New York office, died on July 27 at his home in Bronxville, N. Y., aged 68 years. He was born at Queensville, Ont., and early in life entered the employ of a railroad equipment manufacturer in Minnesota. Later he became associated with the American Locomotive Co., rising to a vice-presidency. During the World War he was instrumental in the organization of the Eddystone Munition Works, Eddystone, Pa., becoming president and general manager of the plant. At the close of the war he went with the Baldwin organization as a vice-president.

W. L. ARNOLD, until 1926 a vice-president of the Arnold Co., Chicago, engineer and constructor, died July 27.

HENRY J. BURT, structural engineer associated with Holabird & Roche, Chicago architects, died July 28, aged 55 years.

Copper Steady and Firm, Tin Slightly Easier, Lead and Zinc Unchanged, Antimony Advances

Copper.—Consumers have come into the market to a moderate extent during the past week for September copper. It is estimated in some quarters that about 20 per cent of the metal that will be needed for that month has been bought, and producers have now opened their books for October. There is very little August copper available, but all of the important users are well covered, so there is little fear of a shortage.

Delivered Prices, Base Per Lb.

Zinc sheets (No. 9), casks	10.00c. to 10.50c.
Zinc sheets, open	11.00c. to 11.50c.

Prices for electrolytic copper remain unchanged at 14.75c., delivered Connecticut Valley, as the domestic basis; while the export price is 15c., delivered European ports. Demand for Lake copper has been fairly active, mostly for August but some for September. Prices range from 14.75c. to 14.82½c., delivered.

Copper Averages.—The average price of Lake copper for the month of July, based on daily quotations in THE IRON AGE, was 14.76½c., delivered. The average price of electrolytic copper was 14.50c., refinery, or 14.75c., delivered in the Connecticut Valley.

Tin.—Except on Wednesday last, when consumers came into the market for nearby tin, the market has

been fairly quiet. About 400 tons was sold on Wednesday at an average of 48.75c., with some sales at 49c., but the price has since declined and today the market was quotable at 47.75c., which, however, represents a decline of only ¼c. per lb. in the week. Yesterday (Monday) there was again a good demand from consumers, but not much business resulted. London prices today were £214 for spot standard, £213 5s. for future standard, £216 15s. for spot Straits; the Singapore price was £215 10s.

Lead.—With business moderately good, the lead market has been steady throughout the week. Prices remain at 6c., St. Louis, and 6.20c., New York, the latter being the contract

Non-Ferrous Rolled Products

Zinc sheets were advanced ½c. per lb. on July 30 and are now quoted at 9.75c., base. There has been no change in mill prices on bronze, brass and copper products and zinc sheets are still quoted at 10c. to 10.25c.

List Prices, Per Lb., f.o.b. Mill

On Copper and Brass Products, Freight up to 75c. per 100 Lb. Allowed on Shipments of 500 Lb. or Over

price of the American Smelting & Refining Co.

Zinc.—Prices are slightly stronger. While there were small sales during the week at 6.20c., East St. Louis, for prime Western, the bulk of the metal available at this price may have been taken and producers generally are asking 6.25c. for forward delivery. Indications are that 6.25c. may become the minimum of the market before the end of the week.

Antimony.—With more active business, antimony has strengthened within the week and today was quoted at 10c. for spot and 10.25c. for forward delivery, duty paid, New York.

Nickel.—Prices are unchanged at 35c. for ingot, 36c. for shot and 37c. for electrolytic nickel.

Aluminum.—Virgin metal, 98 to 99 per cent, continues at 23.90c. in

the outside market. The Aluminum Co. of America quotes 99 per cent plus at 24.30c.

Non-Ferrous Metals at Chicago

CHICAGO, July 31.—The local market is quiet, with sales in small volume and prices unchanged, except in tin, which has been advanced. Quotations for old metals are untested in a dull market.

Prices, per lb., in carload lots: Lake copper, 14.87½c.; tin, 49.50c.; lead, 6.10c.; zinc, 6.30c.; in less-than-carload lots, antimony, 11.25c. On old metals we quote copper wire, crucible shapes and copper clips, 10.75c.; copper bottoms, 9.75c.; red brass, 9.50c.; yellow brass, 7.25c.; lead pipe, 4.75c.; zinc, 3.50c.; pewter, No. 1, 30c.; tin foil, 36.25c.; block tin, 45.25c.; aluminum, 12c.; all being dealers' prices for less-than-carload lots.

Fabricated Structural Steel

New York Office Building Will Take 16,600 Tons and Chicago Board of Trade, 15,000 Tons—Awards Light

AN office building in New York, calling for 16,600 tons, and a structure for the Chicago Board of Trade, which will take 15,000 tons, brought the total of new projects reported during the week to 46,300 tons. Other large pending jobs which have come out recently are a municipal water development at Oakland, Cal., involving 7200 tons of plates, and a Cleveland hospital of 4000 tons. The following awards of 22,700 tons include no jobs of outstanding size:

WORCESTER, MASS., 700 tons, school, to Eastern Bridge & Structural Co.

STATE OF VERMONT, 400 tons, bridges, to American Bridge Co.

PROVIDENCE, 1500 tons, Memorial Bridge, to Phoenix Bridge Co.

HARTFORD, CONN., 600 tons, alteration to department store of Sage, Allen & Co., to an unnamed local fabricator.

NEW YORK, 14,275 tons reported to Structural Steel Board of Trade; 5400 tons in the following jobs not previously reported: Extension to East River power station at Fourteenth Street, to Post & McCord, Inc.; building for National City Bank, 3 West Twenty-eighth Street, to Taylor-Fichter Steel Construction Co., and Mount Washington Presbyterian Church, 84 Vermilyea Avenue, to Eidlitz & Ross.

NEW YORK, 1300 tons, addition to store of Bedell Co., 19 West Thirty-fourth Street, to Taylor-Fichter Steel Construction Co.

NEW YORK, 1200 tons, apartment building, 1 East End Avenue, to Levering & Garrigues Co.

NEW YORK, 700 tons, Methodist Episcopal Home at Spuyten Duyvil, to A. E. Norton, Inc.

NEW YORK, 400 tons, miscellaneous work for Interborough Rapid Transit Co., to Belmont Iron Works.

GARDEN CITY, N. Y., 800 tons, Adelphi College, to McClintic-Marshall Co.

GLENS FALLS, N. Y., 400 tons, building for Glens Falls Insurance Co., to McClintic-Marshall Co.

PENNSYLVANIA RAILROAD, 500 tons, bridge at Bridgeport, Pa., to McClintic-Marshall Co.

PENNSYLVANIA RAILROAD, 200 tons, bridges in western Pennsylvania, to American Bridge Co.

BALTIMORE, 250 tons, Park Bank addition, to Baltimore Steel Co.

BIRMINGHAM, 600 tons, power plant for

Alabama Power Co., to Virginia Bridge & Iron Co.

GREENSBURG, PA., 110 tons, tipples for Keystone Coal & Coke Co., to Jones & Laughlin Steel Corporation.

PITTSBURGH, 1100 tons, Pennsylvania Railroad produce yard buildings, to Jones & Laughlin Steel Corporation.

CLEVELAND, 150 tons, factory building for Eaton Axle & Spring Co., to Massillon Bridge & Structural Co.

CLEVELAND, 125 tons, factory building for Willard Storage Battery Co., to Massillon Bridge & Structural Co.

TOLEDO, OHIO, 500 tons, power plant for Henry L. Doherty & Co., to American Bridge Co.

CHICAGO, 3000 tons, tower on Palmolive-Peet Building, to American Bridge Co.

ST. LOUIS, 825 tons, express terminals for American Railway Express, to Mississippi Valley Structural Steel Co.

LINCOLN, NEB., 225 tons, Nurses' Home for St. Elizabeth Hospital, to St. Joseph Structural Steel Co., St. Joseph, Mo.

OMAHA, NEB., 650 tons, Joslyn Building, to Omaha Structural Steel Co.

GREAT FALLS, MONT., 600 tons, high school, to Minneapolis Steel & Machinery Co.

BENSON, ARIZ., 260 tons, bridge, to Virginia Bridge & Iron Co.

PHOENIX, ARIZ., 100 tons, high school auditorium, to Minneapolis Steel & Machinery Co.

SAN FRANCISCO, 165 tons, apartment building, Taylor and Jackson Streets, to Western Iron Works.

SAN FRANCISCO, 100 tons, apartment building on Eddy Street, to Golden Gate Iron Works.

Structural Projects Pending

Inquiries for fabricated steel work include the following:

NEW YORK, 16,600 tons, Reynolds Tower

Building at Forty-second Street and Lexington Avenue.

NEW YORK, 500 tons, miscellaneous work for Interborough Rapid Transit Co.

ITHACA, N. Y., unstated tonnage, plant industry building at Cornell University for New York State College of Agriculture.

STATE OF NEW YORK, 400 tons, highway bridges.

NASSAU COUNTY, N. Y., 400 tons, highway work.

PENNSYLVANIA RAILROAD, 500 tons, bridges.

ERIE RAILROAD, 200 tons, bridge at Rutherford, N. J.

WOODLYNNE, N. J., unstated tonnage, Woodlyne National Bank building.

PRINCETON, N. J., unstated tonnage, Joline and 1903 dormitories at Princeton University.

PLEASANTVILLE, N. J., unstated tonnage, senior high school; S. Hudson Vaughn, Atlantic City, N. J., architect.

ATLANTIC CITY, N. J., 160 tons, Park Lane Hotel; William Macy Stanton, Philadelphia, architect.

PHILADELPHIA, 800 tons, elevator wells for new Strawbridge & Clothier building; Turner Construction Co., New York, general contractor.

PHILADELPHIA, 590 tons; highway bridges at Sixth and Alleghany Streets, 375 tons, and at Ashdale Street, 100 tons, to Horridge, Elcock & Hall, general contractors; at Leverington Street, 115 tons, to Seeds & Durham, Philadelphia, general contractors.

PHILADELPHIA 1200 tons, Blackstone Hotel.

CAMDEN, N. J., unstated tonnage, factory building for Charles K. Cook Co., 211 South Second Street.

CLEVELAND, 4000 tons, Lakeside Hospital; bids close Aug. 15.

DETROIT, 1050 tons, Bell Telephone building.

CHICAGO, 1200 tons, building for General Electric Co., West Pershing Road and Ashland Avenue.

CHICAGO, 15,000 tons, Board of Trade Building.

CHICAGO, 1000 tons, power house for University of Chicago.

CHICAGO, 600 tons, store and loft building.

CHICAGO, 400 tons, Ashland Commercial Exhibit Building.

ST. LOUIS, 1200 tons, 18-story apartment building.

SAN FRANCISCO, 1400 tons, Pier 45; bids Aug. 15.

SAN FRANCISCO, 600 tons, power house for Great Western Power Co.; bids soon.

SAN FRANCISCO, 450 tons, hotel, Geary Street; bids being taken.

OAKLAND, CAL., 7200 tons plates, distributing mains for East Bay Municipal Utility District; bids Aug. 17.

PALO ALTO, CAL., 200 tons, telephone building; bids being received.

SACRAMENTO, CAL., 600 tons, office building; bids soon.

LOS ANGELES, 300 tons, apartment building on Whitely Avenue; bids being received.

LOS ANGELES, 320 tons, apartment building on South Serrano Street; bids being received.

The Electric Pig Iron Corporation, Canton, Ohio, has awarded the general contract to the Foundation Co., New York, for a ferrosilicon plant near Philo, Ohio, with initial unit 50 x 375 ft. in size, to cost about \$100,000. A contract has been made with Ohio Power Co. for power service from its generating station at Philo. Excavation has been started.

PERSONAL

ROBERT T. KENT, New York, has become manager of the sales and engineering departments of Divine Brothers Co., Utica, N. Y. Previous to making this connection Mr. Kent was general manager of the Bridgeport Brass Co., Bridgeport, Conn., and for several years before that engagement was superintendent of prison industries of New York, undertaking, at Governor Smith's request, the reorganization of these industries. Mr. Kent is editor and author of Kent's Mechanical Engineers' Handbook, and has been chairman of the A. S. M. E. committee on professional divisions, also for a time chairman of the management division. HOWARD E. BOARDMAN, Mr. Kent's predecessor at Utica, resigned recently to make a connection in New York in another line of business.

J. G. HEATH, vice-president Remington Arms Co., Inc., New York, has been placed in charge of the company's territory from Denver, Colo., to the Pacific Coast, and about Aug. 1 will establish headquarters at San Francisco. There will be no change in the Remington sales organization in the territory. Mr. Heath has been associated with the company during his entire business career, and in 1910 was made manager of the San Francisco office. In 1925 he was selected to head organization work in connection with the Remington Cash Register Co. and the following year became general sales manager for all products of that subsidiary.

W. H. GERHAUSER, recently elected president of the American Ship Building Co., Cleveland, has been made a director of the Union Trust Co. of that city.

JAMES F. MCCRORY, JR., until recently assistant manager Pittsburgh office, Eaton, Rhodes & Co., has become manager of sales for the Breck Fuel Co., Oliver Building, Pittsburgh.

W. R. HULBERT, sales manager of the thermit department, Metal & Thermit Corporation, 120 Broadway, New York, has resigned, and on Aug. 1 will become a member of the firm of Thomas H. & Milan H. Hulbert, 6 North Michigan Avenue, Chicago. He was graduated in mechanical engineering from Columbia University in 1904, and during the next three years was connected with the Power & Mining Machinery Co., the Rand Drill Co. and the Kobbe Co., New York. He went with the Goldschmidt Thermit Co. in 1907 as assistant engineer, and when the Metal & Thermit Corporation was formed in 1916 he was made sales manager of the thermit department. Mr. Hulbert will be succeeded by JOHN B. TINNON, since 1924 manager of the rail welding department.

Mr. Tinnon attended Vanderbilt University, Nashville, Tenn., and from 1908 until 1924 was identified with the electric railroad field.

SCOTT STEWART, president of W. J. Rainey, Inc., and vice-president of the Rainey-Wood Coke Co., 52 Vanderbilt Avenue, New York, was elected president and a director of the latter company at a recent board meeting. H. C. THOMAS, president Alan Wood Iron & Steel Co., Philadelphia, was elected vice-president and a director of the Rainey-Wood company; ALAN D. WOOD, vice-president and treasurer of the Alan Wood company, treasurer and a director, and H. R. AHRENS, secretary and treasurer of W. J. Rainey, Inc., secretary. R. A. RAINEY, chairman of W. J. Rainey, Inc., was also made a director of the coke company.

WILLIAM F. HARTMANN has retired from active service as treasurer of the Bethlehem Steel Corporation, New York, and its subsidiary companies. WILLIAM J. BROWN has been elected treasurer of the Bethlehem corporation, with offices at 25 Broadway, New York, and J. P. BENDER has been named treasurer of the Bethlehem Steel Co. and the Bethlehem Shipbuilding Corporation, Ltd., with offices at Bethlehem, Pa.

GEORGE L. ABBOTT, for the last 20 years associated with the Garlock Packing Co., Palmyra, N. Y., most recently as vice-president and general manager, has been elected president of the company, and has been succeeded by WARD K. ANGEVINE.

E. EVERETT GIBBS, formerly president Southern Can Co., Baltimore, which is now owned and operated by the Continental Can Co., Inc., New York, will continue with the Continental company as district representative at Baltimore.

MARTIN J. RYAN, for the last eleven months sales supervisor for the Northern New York Utilities, Inc., Utica, N. Y., has been appointed assistant sales manager of that company. He was formerly superintendent of the Giblin Foundries, of that city.

FOWLER MANNING has been appointed vice-president and general manager of L. C. Smith & Corona Typewriters, Inc., Syracuse, N. Y., and will take charge of the company's operations at Syracuse on Sept. 1. The position was created at the last meeting of the board, and in his new capacity Mr. Manning will relieve President FRANK R. FORD of many executive details.

LEWIS B. LINDEMUTH, of Carney & Lindemuth, consulting engineers, New York, left for Mexico on July 27 and will spend a month there as consultant for Cia, Fundidora de Fierro y Acero de Monterrey, S. A., Monterrey.

MARCUS T. DONAHUE has been appointed sales manager of the H. C. Atkins Mfg. Co., 2318 Randolph Street, St. Louis.

H. C. BECKWITH, for the last 12 years representative in the St. Louis district for the Trumbull Steel Co., Warren, Ohio, has been appointed St. Louis district representative for the Newport Rolling Mill Co., Newport, Ky., and for the West Leechburg Steel Co., Pittsburgh. His headquarters will remain at 1413 Chemical Building.

ANDREW R. JOHNSON, assistant New York district manager for the Republic Iron & Steel Co., has been appointed assistant general sales manager in charge of tin plate sales, with headquarters at Youngstown, succeeding AVERY C. ADAMS. Mr. Johnson was New York district sales manager for the Trumbull Steel Co. prior to its absorption by the Republic company.

WILLIAM L. FINGER, Ripley, Miss., has been appointed trade commissioner at Paris. Since May, 1926, he has been secretary to Dr. Julius Klein, director of the Bureau of Foreign and Domestic Commerce, Department of Commerce.

GEORGE P. RHODES, president Colonial Steel Co., Pittsburgh, and IRVIN F. LEHMAN, vice-president Blaw-Knox Co., Pittsburgh, have been elected directors of the Pressed Steel Car Co.

JOHN M. ELLIS, New York district sales agent for the Bethlehem Steel Co., sailed July 28 for a several weeks' stay in Europe.

WILLIAMS C. DICKEY, New York representative of the Worth Steel Co., Claymont, Del., and other mills, will sail on the Berengaria Aug. 29 for a few weeks in Europe.

DONALD MACARTHUR, vice-president Seaboard By-Product Coke Co., Philadelphia, has, in addition to his present duties, been placed in general charge of the Philadelphia Coke Co., Philadelphia, a recently formed subsidiary of the Koppers Gas & Coke Co. W. H. EARLE, formerly in charge of the New York office of the Koppers Construction Co., will be manager of the new company; R. L. SPATZ, who has been a construction engineer for the Koppers Construction Co., will be assistant manager, and FRED DENIG, recently assistant superintendent of the operating department of the Construction company, will be superintendent. The coke plant now under

construction for the Philadelphia company will be placed in operation about Feb. 1, 1929.

ELLIOTT E. VAN CLEEF, 53 West Jackson Boulevard, Chicago, has been appointed district agent for the Roller-Smith Co., 233 Broadway, New York. MICHAEL B. MATHLEY, who has been connected with the company's Chicago office for a number of years, will be associated with Mr. Van Cleef.

WILLIAM HUNTER, who has been acting manager of the Philadelphia

office of the Niles-Bement-Pond Co. since the first of the year, was made manager of that office on July 1. He has been associated with the Niles company divisions for a number of years.

A. C. SHAND, for many years chief engineer of the Pennsylvania Railroad and more recently assistant to the vice-president in Philadelphia, retired Aug. 1. Mr. Shand, who was 70 years of age in July, has been connected with the railroad for about 49 years.

improving tendency in operations and an inclination on the part of customers to cover for forward business.

Bethlehem's Billing Price Rises

The Bethlehem Steel Corporation had net income in the second quarter of \$4,529,328, equivalent after dividends on preferred stock to \$1.57 a share on common. This compares with \$3,384,718 or 94c. a share on common in the preceding quarter and with \$5,048,680 in the second quarter last year.

In commenting upon the situation, President Eugene G. Grace stated that although the average billing price on all products during the last quarter was \$2 a ton less than in the June quarter last year, it was 53c. greater than in the preceding quarter. Operations during the second quarter averaged 82.5 per cent of capacity, compared with 79.5 per cent in the preceding quarter and with 75.6 per cent during the second quarter of 1927. "Current operations," he said, "are at a 75 per cent rate, as against 64 per cent in July, 1927. I look for a continuation of the increasing demand during the fall and winter and am also hopeful that the upward trend of price indicated by second quarter billings will continue."

The value of unfilled orders on hand June 30 was \$51,761,908, as compared with \$61,393,488 on March 31 and with \$48,655,757 on June 30, 1927.

Wheeling Makes Good Showing

Second quarter earnings of the Wheeling Steel Corporation amounted to \$1,530,125, as compared with \$1,024,213 in the preceding quarter and with \$855,936 in the June quarter last year. This company's half-year profits totaled \$2,554,338 in 1928 and \$1,848,186 in 1927.

Carrying the largest cargo ever transported on the Great Lakes, the steamer Carl D. Bradley tied up at the Buffington, Ind., harbor of the Universal Portland Cement Co. on July 27 with 16,033 gross tons of limestone. The Bradley used its own automatic electrical machinery to discharge its cargo at the rate of a ton a second.

Steel Company Earnings

Steel Corporation's for Second Quarter Were \$2.75 Per Share of Common Stock

EARNINGS of the United States Steel Corporation for the second quarter of 1928 were at the rate of \$2.75 per share of common stock, after providing for the preferred stock dividend, or substantially at the rate of the same quarter a year ago. The earnings of the first quarter were at a \$2.11 rate, so those for the first half of the year amount to \$4.86, against common stock dividend requirements of \$3.50, the regular 7 per cent rate, which was declared for the quarter just closed. In the second quarter of 1927, the common stock earnings were at a \$2.78 rate.

Total earnings were roughly \$6,000,000 greater in the June quarter than in the March quarter, but greater allowances were made for depreciation and the like, and the surplus for the quarter was \$7,110,428 against \$2,573,541 for the preceding quarter. The following tables show also the earnings of recent years:

EARNINGS IN RECENT YEARS			
Quarters	1928	1927	1926

Surplus for the quarter			
\$7,110,428			

President James A. Farrell, at the conclusion of the meeting of the board of directors of the Steel Corporation, July 31, issued the following statement:

Our shipments of finished steel products in the second quarter equaled 84½ per cent of total mill capacity, compared with 86 per cent in the first quarter of 1928, and with 84 per cent in the second quarter of 1927. The tonnage of shipments in the June quarter this year actually exceeded in total the tonnage shipped in the corresponding quarter in 1927.

The slightly higher selling prices netted in the second quarter, with improved operating costs, together with the receipt of income from seasonal business, account for the increase of 14½ per cent in reported earnings for the second compared with the first quarter of 1928, notwithstanding the volume of steel shipments, was slightly less.

Since July 1 operations of the mills have been slightly below the average for the second quarter, influenced somewhat by the slackening in pace arising from hot weather. The demand for steel as evidenced by new business being booked points to a very fair degree of operations, due consideration being given to general trade conditions, during the remainder of the summer and early fall.

Apart from the foregoing there are no features of special interest in the steel situation other than that business is proceeding as usual with an

Machinery Markets and News of the Works

Large Orders Placed in East

Wright Aeronautical Corporation, Paterson, N. J., Buys \$200,000 Worth of Turret Lathes and Milling Machines—July Business Good

JULY machine tool business in the entire country has averaged well up to the June total, while in the New York district some sellers who shared in the large orders placed by the Wright Aeronautical Corporation, Paterson, N. J., have had the best month of the year, and, in fact, the best month in several years.

The Wright Aeronautical Corporation bought upward of \$100,000 worth of milling machines and close to that amount in turret lathes. Its purchases of other tools also were considerable. In addition, the orders being placed by the General Electric Co. have swelled the month's sales.

At Cincinnati, Cleveland and Chicago sales fell somewhat below the totals for June, but were much better than the average for July. Railroad buying is light, but a fair amount of business is pending in the Detroit automobile district, especially in high production tools. Orders from miscellaneous industries make up the bulk of current business.

The Gabriel Snubber Mfg. Co., Cleveland, is to bring out a new hydraulic shock absorber for automobiles and probably will purchase additional equipment. The International Harvester Co. will build a caterpillar-type tractor in its Chicago works, and considerable new shop equipment will be needed. The Waukesha Motor Co., Waukesha, Wis., which is building a large addition to its plant, has bought a number of multiple spindle drilling machines and is still in the market for milling and drilling equipment. The Spicer Mfg. Corporation has bought additional machinery for its Toledo, Ohio, plant.

The Chicago Board of Education has issued a large list of equipment to be purchased for schools, bids to close Aug. 2.

New York

NEW YORK, July 28.—Large orders placed by the Wright Aeronautical Corporation, Paterson, N. J., eclipsed all other business done in the local machine tool market the past week. The Wright company's orders for milling machines and turret lathes alone well exceeded \$200,000, and other orders for miscellaneous tools were given out. Early deliveries were stipulated so that the new unit of the Wright plant can be put in production by Sept. 1 or shortly thereafter. Additional inquiries were received by the machine tool trade from the General Electric Co., which has been buying quite heavily for its refrigerator manufacturing departments at Schenectady and Erie. The Wright orders, together with a fairly good demand from scattered sources for single tools, will bring up July sales for many sellers in this district to the largest monthly total of the year. In a few instances it will be the largest month since the war. One turret lathe order amounted to \$70,000,

while a milling machine order totaled about \$60,000 and another was about \$50,000.

Sales of Niles-Bement-Pond Co. during the week included a 5-ft. and a 6-ft. radial drilling machine and a 73-in. boring mill. Pratt & Whitney division sold four lathes, two vertical shapers and two profiling machines.

Plans are under way by American Can Co., 120 Broadway, New York, for new factory branch and distributing plant at Denver, Colo., to cost close to \$200,000 with equipment; proposed to begin work about middle of August. Later, company is said to be planning main manufacturing unit at same location, to cost upward of \$750,000 with machinery. Company engineering department is in charge.

Officials of Dempsey Furnace Co., 525 Sixth Avenue, New York, have organized new company of same name to take over and expand present concern, and will increase production in line of industrial furnaces.

Farber & Kalkin, 1746 Pitkin Avenue, New York, architects, have filed plans for one-story automobile service, repair and garage building, 100 x 200 ft., to cost close to \$100,000 with equipment.

Central Foundry Co., 1434 Fulton Street, Brooklyn, has asked bids on general contract for new two-story branch storage and distributing plant at Forest Hills, L. I., to cost approximately \$40,000. Bly & Hamann, 551 Nostrand Avenue, are architects.

Northern Westchester Lighting Co., Ossining, N. Y., is having plans drawn for two power substations to cost approximately \$175,000 with equipment. Thomas E. Murray, Inc., 55 Duane Street, New York, is architect and engineer.

R. Hoe & Co., Inc., 504 Grand Street, New York, manufacturer of printing presses and parts, saws, etc., has purchased former plant of De La Vergne Machine Co., manufacturer of refrigerating equipment, fronting on East River, from 137th to 138th Street, and will remodel for new plant. Present business will be removed to new location and additional machinery provided for increase in output, particularly in connection with new model of newspaper printing press. Company is reported considering removal of branch plant at Dunellen, N. J., to new site, concentrating all production at that location.

DeYoung & Moscovitz, 11 East Forty-fourth Street, New York, architects, will soon take bids on general contract for five-story automobile service, repair and garage building, to cost approximately \$125,000 with equipment.

H. Muehlstein & Co., 41 East Forty-second Street, New York, Herman Muehlstein, head, manufacturer of rubber products, has acquired former machine and erecting shop of Erie Railroad Co. at Jersey City, N. J., and will remodel for new branch plant.

Sterling Casket Hardware Co., 5851 Grand Avenue, Maspeth, L. I., George R. Bailey, president, has awarded general contract to Eugene F. Warwick, Crescent Plaza Building, Long Island City, for one-story plant, 82 x 100 ft., to cost close to \$30,000 with equipment. Harry R. Harvie, 370 Seventh Avenue, New York, is architect.

Stern & Peyser, 12 East First Street, Mount Vernon, N. Y., architects, have plans for a two-story automobile service, repair and garage building, to cost \$100,000 with equipment.

Fire, July 22, damaged portion of factory of Noma Electric Corporation, 334-44 Hudson Street, New York, manufacturer of lighting equipment, fixtures, etc.

Lackawanna Railroad Co., 90 West Street, New York, plans installation of elevating, conveying and other freight-handling equipment, in group of warehouse and distributing buildings to cover six blocks at Jersey City, N. J., to cost close to \$14,000,000. Work is scheduled to begin soon. Engineering department of company is in charge.

Water Committee of Board of Trustees, South Orange, N. J., will receive bids until Aug. 15 for multiple unit zeolite water-softening plant for municipal waterworks, with complete mechanical accessories. Plans and specifications at

The Crane Market

NOT much new inquiry has appeared in the past week, either for overhead or locomotive cranes, but sellers are busy with a fair number of inquiries that have been in the market for some time. No action has been taken as yet on the cranes and steam shovels for export inquired for by Dwight P. Robin-

son & Co., New York, some time ago. Fox Brothers International Corporation, New York, will probably be in the market before long for some locomotive cranes for use in Turkey.

Among recent purchases are:

L. W. & P. Armstrong, 96 Wall Street,

New York, two 30-ton, 50-ft. span overhead cranes with two 15-ton trolleys for Centrale Fajardo at Fajardo, Porto Rico, from Whiffing Corporation.

Brooklyn-Manhattan Transit Corporation, Brooklyn, N. Y., 25-ton hand power crane for power station from unnamed builder.

office of Ira T. Redfern, Village Hall, village engineer.

Hanson-Van Winkle-Munning Co., 324 Chestnut Street, Newark, comprising recent merger of Hanson-Van Winkle Co., Newark, and A. P. Munning & Co., Matawan, has purchased plant of Wickham Co., adjoining Munning plant at Matawan, recently vacated when company removed to Springfield, Ohio. New owner will remodel for expansion. It is purposed to build an addition later and concentrate larger part of production at that location.

Board of Public Works, Paterson, N. J., Edward Dupree, city clerk, is asking bids until Aug. 14 for power house for municipal refuse destructor plant, comprising turbo-generator, pumps, feed water heater, air compressors, pressure release tank, deep well air lift water system, valves and complete accessories. Plans and specifications at office of city engineer, City Hall.

Plant formerly occupied by R. Newman Hardware Co., St. Francis and East Ferry Streets, Newark, has been purchased by Rauchbach-Goldsmith Co., 9 St. Francis Street, manufacturer of metal trunks, etc. Property totals about 150,000 sq. ft. floor space, and will be used in part for expansion.

Newark Steam Heating Co., Newark, has purchased two-story factory at 131-33 South Twelfth Street, and will remodel for new plant.

International Metal Bed Co., 1-17 St. Francis Street, Newark, has been formed to manufacture metal beds. It will be in market for materials and equipment, particularly metal tubing, and will carry on all manufacturing operations except making of tubing.

W. B. Connor Co., Brooklyn, manufacturer of air filters, steam traps, pumps, etc., has leased, with option to purchase, 6½ acres at Lincoln Park, N. J., improved with factory building, 60 x 200 ft.

Doehler Furniture Co., Inc., Brooklyn, has been organized as subsidiary of Doehler Die Casting Co. to manufacture metal furniture, parts of which will be die-cast. All manufacturing will be done in plants of parent company.

Engineering Service Corporation, 943 Broadway, Albany, N. Y., has been formed to carry on engineering and research work including designing of mechanical devices and evolving plans for production cost reduction. Company has complete chemical and physical laboratories, testing equipment and machine shop facilities.

New England

BOSTON, July 30.—Contrary to earlier reports, the city of Boston has purchased no tools against its Hyde Park district school list. Machine tool dealers have refused to guarantee deliveries of

tools on specified dates. Bids close today on miscellaneous wood-working tools.

Kingsbury Machine Co., Keene, N. H., has started work on a plant addition.

Waterbury Farrel Foundry & Machine Co., Waterbury, Conn., is erecting machine shops, to cost with equipment \$130,000.

Leo Shlick, 314 Beacon Street, Boston, architect, has taken bids on a one-story 80 x 200 ft., addition for A. L. Adams Paper Co., Templeton, Mass., for which motors and other equipment are needed.

Plans are nearing completion for a one-story and sub-basement, 50 x 225 ft., addition for Metal Craftsman, Inc., 141 Georgia Avenue, Providence, R. I.

General Electric Co., River Works, West Lynn, Mass., has completed plans for a two-story, 20 x 100 ft., power house addition. Mr. Trudinger, 920 Western Avenue, Lynn, is in charge.

Plans have been drawn by H. T. McCluskey & Sons, Inc., Grand Avenue, New Haven, Conn., manufacturer of wire goods, for one-story addition, 40 x 62 ft., reported to cost about \$23,000 with equipment. Dwight E. Smith, New Haven, is architect.

Following recent purchase of plant and business of Fall River Spindle Co., Fall River, Mass., manufacturer of cotton mill machinery, etc., by Norlander Machine Co., New Bedford, Mass., latter company has leased property at Spartanburg, S. C., for Southern branch plant, to be devoted largely to parts production and repair work. Machinery from Fall River plant will be removed to new location and additional equipment provided. John Price, Sr., former owner of Fall River company, will be manager at Spartanburg.

A. D. Windle Co., Howe Avenue, Millbury, Mass., operating a local woolen mill, is reported contemplating a new power plant to cost close to \$50,000 with equipment.

J. M. Carpenter Tap & Die Co., Pawtucket, R. I., has been organized with capital of \$150,000 to take over and expand local company of same name with plant at 20 Newell Avenue, specializing in production of taps, dies, reamers and kindred metal cutting tools. New incorporators include R. S. Carter and A. H. Commins.

Peoples Hydro Electric Vermont Corporation, Montpelier, Vt., has begun work on hydroelectric generating plant on Winooski River, near Montpelier, to cost in excess of \$175,000 with equipment; extensions will be made in transmission lines.

Swaine Iron Works, Springfield, Mass., has acquired plant and business of Springfield Stamping & Tool Co., Inc., and will consolidate with its organization. New owner is reported planning continuance of production at Springfield works as branch plant.

Hartford Electric Light Co., Hartford, Conn., has awarded general contract to Industrial Construction Co., 721 Main

Street, for extensions and improvements in power plant, to cost more than \$40,000 with equipment.

Maine Steel Products Co., Portland, Me., recently organized to take over and consolidate Marine Hardware Equipment Co., Portland, and Bangor Iron Works, Bangor, Me., has begun operations at Portland mill and will devote initial output largely to production of improved type of steel snow plows, including parts and assembling.

Cadillac-LaSalle Co., Providence, R. I., operated by Cadillac Investment Co., Milton J. Budlong, head, local representative for Cadillac and LaSalle automobiles, plans early construction of new service, repair and sales building, to cost in excess of \$350,000 including equipment.

Kimball Aircraft Corporation, Naugatuck, Conn., has been formed to manufacture airplane motors. It has a local plant and will be in market for materials and equipment.

Pittsburgh

PITTSBURGH, July 30.—The Westinghouse Electric & Mfg. Co. is ordering steadily against its third quarter tool list, but this buying constitutes the principal activity in point of sales, which in general are adversely affected by the vacation period. Inquiries are numerous, however, and the trade takes hope, from the high rate of steel plant engagement for this time of year, that they will develop into actual business later.

Plans are being arranged by Pennsylvania Railroad, Pittsburgh, for new engine house with repair facilities, yard and terminal improvements, at Benwood, W. Va., to cost close to \$200,000 with equipment. Company is arranging expansion and improvement program in Pittsburgh district to cost close to \$40,000,000, including produce terminal, with cold storage and refrigerating division, and freight terminal, with elevating, conveying and other equipment. Last two noted projects are each reported to cost more than \$1,000,000.

Pittsburgh Plate Glass Co., Frick Building, Pittsburgh, has approved plans for four-story addition to plant at Clarksburg, W. Va., 150 x 390 ft., to cost more than \$300,000.

General Benzol Corporation, Warren, Pa., recently organized by A. L. Sleeman and associates, with capital of \$500,000, has purchased property of Warren Refining Co., whose plant in Venturatown district, was destroyed by fire more than a year ago. New owner plans construction of oil refinery to cost upward of \$200,000 with equipment; additional units will be added later.

Pennsylvania Transfer Co., 298 Duquesne Way, Pittsburgh, has awarded general building contract to Nicola Building Co., 6388 Penn Avenue, for one-story

automobile service, repair and garage building to cost approximately \$85,000 with equipment. J. P. McWilliams, 126 North Highland Avenue, is architect.

Pittsburgh Screw & Bolt Co., 2719-41 Preble Avenue, Pittsburgh, has filed plans for extensions and improvements in plant to cost about \$24,000.

John C. Neals, Sewickley, Pa., and associates have organized Altithermo Engineering Co., to establish and operate a plant for manufacture of gas machinery and appliances. L. B. Cuddy, Sewickley, will also be an official of company.

Trojan Steel Co., 322 South Avenue, Charleston, W. Va., will take over plant and property of Becker Steel Co., South Charleston, W. Va., recently acquired at public sale by R. M. Venable, Charleston, and associates. New owner plans improvements and will begin production soon.

Board of Education, Lewistown, Pa., is said to be planning installation of manual training equipment in two-story addition to junior high school to cost about \$160,000, for which bids will soon be asked on general contract. Hersh & Shollar, Commerce Building, Altoona, Pa., are architects.

H. Bettis Co., Inc., Wheeling, W. Va., manufacturer of wirebound barrels, boxes, etc., has acquired a factory at Zanesville, Ohio, and will remodel for branch plant, to cost close to \$100,000 including machinery. Company is said to be planning for further expansion at Zanesville.

South Atlantic

BALTIMORE, July 30.—Work will soon be started by Asiatic Petroleum Co., Ltd., 65 Broadway, New York, on new oil refinery and storage and distributing plant in Fairfield district, Baltimore, where property recently was acquired. Project will include one unit for asphalt refinery, and will cost about \$1,000,000.

Highland Motor Sales Co., 3415 Eastern Avenue, Baltimore, has revised plans for two-story service, repair and garage building, to cost more than \$80,000, for which bids will be asked on general contract early in September. R. C. Brockmeyer, 1665 North Milton Avenue, is architect.

American Oil Co., American Building, Baltimore, will soon take bids on general contract for one-story oil storage and distributing plant at Dunmore, Pa., to cost upward of \$75,000 with equipment.

Board of District Commissioners, District Building, Washington, will receive bids until Aug. 8 for steel shelving, cases, etc., for new McKinley high school.

American Chatillon Corporation, 393 Seventh Avenue, New York, has approved plans for one-story power house and machine shop at rayon mill at Rome, Ga. Entire project will consist of seven manufacturing units to cost approximately \$3,500,000 with machinery. Lockwood, Greene & Co., 1 Pershing Square, New York, and Greenville, S. C., are architects and engineers.

Chesapeake & Ohio Railroad Co., Richmond, Va., will make an expenditure of close to \$10,000,000 for expansion in locomotive and car repair facilities, instead of smaller sum previously noted in these columns, to be carried out in connection with general development program aggregating \$21,144,724. Shop work will include new locomotive construction and repair units at Huntington, W. Va., to cost \$3,500,000 with equipment; improvements and extensions

in shops at Richmond to cost \$1,000,000; additions to locomotive shops at Clifton Forge, Va., including equipment, to cost about \$1,000,000; extensions to shops at Hinton, W. Va., including track facilities, to cost \$1,260,000; new engine terminal with shop facilities at Cincinnati, to cost \$2,300,000 with machinery; and new engine house, with repair facilities, at Ashland, Ky., to cost \$500,000. Work on program will begin soon.

City Council, Baltimore, plans early acquisition of about 1000 acres as site for municipal airport, to include hangars, repair and reconditioning shops, oil storage and distributing buildings, and other units, to cost more than \$500,000. Charles F. Goob is city engineer in charge.

Master Auto Repair Co., Charleston, S. C., recently organized by Arthur L. Way, 67 Reid Street, and associates, plans early establishment of machine repair shop, with facilities for parts manufacture, etc.

Southern Spring Bed Co., 290 Hunter Street, Atlanta, Ga., has awarded general contract to Padgett & Sutton, Bona Allen Building, for two-story plant unit, 100 x 122 ft., to cost about \$26,000 with equipment. Hentz, Adler & Schutze, Candler Building, are architects.

Paul A. Bennett Motor Co., 614 Trade Street, Winston-Salem, N. C., has leased two-story and basement building, 75 x 200 ft., to be erected at Sixth and Marshall Streets, for service, repair and garage unit, to cost close to \$100,000 with equipment.

Whitney Mfg. Co., Whitney, S. C., has approved plans for enlargements in machine shops and pumping plant at its textile mill, and will install additional equipment.

Farmville Furniture & Cabinet Co., Farmville, Va., has approved plans for first unit of new plant, consisting of two one-story factories, each 50 x 250 ft., to cost close to \$80,000 with equipment. Other units will be built later.

Conveying machinery and other handling equipment, factory trucks and tractors, etc., will be installed in new storage and distributing plant to be built by Public Improvement Commission, Munsey Building, Baltimore, to cost about \$570,000. J. E. Greiner, Lexington Building, is engineer.

Allen C. Davis, 121 South Howard Street, Baltimore, is at head of project to establish plant for manufacture of light aircraft. Arrangements are being made to lease building for parts production and assembling. A company will be organized to carry out enterprise.

Eanes Mfg. Co., Asheville, N. C., has been formed to manufacture Eanes weavers' knotter for textile makers. Device is at present being made under contract.

Babcock & Wilson Co. has completed plans for construction at Augusta, Ga., of a refractories plant, which will eventually represent an investment of more than \$1,000,000. A site was recently purchased on Georgia & Florida Railroad tracks and work upon first unit will be started soon. Machinery for plant will be built by company itself.

Philadelphia

PHILADELPHIA, July 30.—York Ice Machinery Co., Belmont and Thompson Streets, Philadelphia, manufacturer of ice-making and refrigerating ma-

chinery, has awarded general contract to Cramp & Co., Denckla Building, for three-story and basement addition, to cost \$115,000 with equipment. Main plant and headquarters are at York, Pa.

Branch-Crawford Co., 1539 Wood Street, Philadelphia, manufacturer of pipe hangers and kindred products, has asked bids on general contract for addition, to cost more than \$30,000 with equipment. Ballinger Co., Twelfth and Chestnut Streets, is architect and engineer.

Philadelphia Steam Co., care of Frank M. Hunter, Gibson Building, Chester, Pa., recently organized, has applied to city council, Philadelphia, for permission to construct steam power plant for central heating service, with initial capacity of about 100,000 hp. Company is arranging for bond issue of \$5,500,000 to provide for plant. Edward H. Reuss, Merion, Pa., is president.

Following recent acquisition of Federal Container Co., Fifty-sixth Street and Paschall Avenue, Philadelphia, by Fiber Board Products, Inc., San Francisco, purchasing company is having plans prepared for a new paperboard mill in vicinity of Philadelphia, to be operated by Federal branch. It will cost in excess of \$450,000 with machinery. Federal company will continue under management of T. C. Mitchell, formerly president.

Philadelphia Garage Co., Carlisle and Cherry Streets, Philadelphia, has awarded general contract to Goler Construction Co., 1600 Arch Street, for extensions and improvements in seven-story service repair and garage building to develop capacity for 1000 cars, to cost close to \$100,000.

Sears, Roebuck & Co., Roosevelt Boulevard, Philadelphia, operating a mail order business with headquarters at Chicago, has had plans drawn for three additional units at local factory branch and distributing plant, to be four stories and basement, 85 x 126 ft.; one story and basement, 85 x 105 ft.; and one story and basement, 40 x 84 ft., to cost more than \$400,000 with equipment. Nimmons, Carr & Wright, 122 South Michigan Avenue, Chicago, are architects.

New Matix Equipment Co., Philadelphia, care of John D. Lawrence, president, Board of Trade, Westville, N. J., recently organized by L. H. Meyers, Philadelphia, and associates, has acquired property at Westville for new plant to manufacture air brakes and kindred products. Initial unit will be one story, and cost more than \$25,000 with equipment.

Middlesex Paper Tube Co., Lowell, Mass., has leased portion of former plant of Mercer Automobile Co., Trenton, N. J., for new branch factory for manufacture of paper tubing, cardboard containers, etc.

City Council, Atlantic City, N. J., has plans for municipal airport expansion at Bader Field, including two steel hangars, with repair and reconditioning facilities, to cost close to \$50,000.

Norman Aircraft Co., care of Jacob Rosenfeld, High Street, Burlington, N. J., recently organized with capital of \$100,000, by Ohio interests, headed by J. W. Overturf, Cleveland, has acquired factory property at Stacy and Barclay Streets, for new plant for manufacture of airplanes. It is understood that an existing works will be removed to this location and additional equipment provided for parts and assembling.

Board of Water Commissioners, Wilmington, Del., has plans for extensions and improvements in municipal waterworks, including central pumping plant on Brandywine River. A fund of \$3,000,000 has been arranged for entire project.

W. Compton Wills is assistant engineer of water department.

Philadelphia Coke Co., Richmond and Kennedy Streets, Philadelphia, has filed plans for one-story manufacturing unit at artificial gas plant, now in course of construction, to cost \$105,000. Entire project will cost more than \$750,000.

Board of Education, Upper Darby, Pa., plans installation of manual training equipment in new three-story high school to cost \$750,000, for which bids are being asked on general contract until Aug. 8. Heacock & Hokanson, 1211 Chestnut Street, Philadelphia, are architects.

Hercules Powder Co., Wilmington, Del., is said to have plans under way for new unit at plant at Carthage, Mo., for production of nitric acid, to be operated under an ammonia oxidation system, to cost close to \$300,000 with equipment.

Nevin Bus Terminal Co., Philadelphia, has engaged W. F. B. Koelle, 112 South Sixteenth Street, architect, to prepare plans for seven-story service, repair and terminal garage on site recently acquired, to cost close to \$500,000 with equipment.

American Steel Engineering Co., 3520 Queen Lane, Philadelphia, dealer in reinforcing steel, structural steel, rolling steel doors and other steel building products, has completed new shop, warehouse and office building at above address.

Detroit

DETROIT, July 30.—Cyclone Fence Co., Waukegan, Ill., has purchased Anthony plant of American Steel & Wire Co., Tecumseh, Mich., and will remodel for production of wire screens, wire cloth, etc. It is planned to begin operations early in fall.

Commonwealth Brass Corporation, 5781 Commonwealth Avenue, Detroit, is planning expansion and will install additional equipment.

Plant No. 1 of Rickenbacker Motor Co., Detroit, has been sold by Security Trust Co., 735 Griswold Street, receiver, to James Holden, Detroit, real estate dealer, acting for a company whose name is temporarily withheld, for a price of \$600,000, subject to approval of court. Receiver's sale of plant No. 2 of Rickenbacker company is scheduled for Aug. 2.

Grand Rapids Metalcraft Corporation, Grand Rapids, Mich., is arranging for an expansion program to include manufacture of new products for automobile service. Exclusive rights have been secured for manufacture of ventilating heater invented by J. W. Kelch, Detroit, and plant unit will be established exclusively for this output. Other departments soon to be operated include those for production of instrument panels, door trim panels, furniture stampings, cowl bars, ash receivers and metal furniture parts.

United States Gypsum Co., 200 West Adams Street, Chicago, has plans for new mill at Detroit for manufacture of gypsum building products, to cost more than \$400,000 with machinery. Plant will be operated in conjunction with other new mill to be built at East Chicago, Ind.

Plant of Jewett Radio Corporation, Telegraph Road, Pontiac, Mich., has been acquired by Baxter Laundries, Inc., Pontiac, and will be remodeled for new mechanical laundry, to cost about \$100,000 including automatic machinery, steam power equipment, etc.

Detroit Edison Co., 2000 Second Boulevard, Detroit, has filed plans for new two-story and basement power substation, to cost about \$350,000 with machinery.

Board of Education, Pontiac, Mich., is considering installation of manual training equipment in new junior high school to cost close to \$500,000, for which bids will be asked on general contract early in August. Malcolmson & Higginbotham, 1219 Griswold Street, Detroit, are architects.

Pontiac Foundry & Machine Co., Pontiac, Mich., has been organized to manufacture non-ferrous castings, wood and metal patterns, dies, tools, jigs, fixtures, etc., and do general machine work. Company has purchased factory building at Dixie Highway and Scott Lake Road, Pontiac, and will do no additional building.

Lenert Aircraft Co., Pentwater, Mich., has been organized to manufacture airplanes of duralumin, chrome molybdenum steel tubing and flat stock.

Newaygo Portland Cement Co., Charlevoix, Mich., will begin work immediately on a plant to cost \$1,000,000.

Cleveland

CLEVELAND, July 30.—The machine tool market made a fair showing for July. While dealers' sales fell off the past week, volume during the month was about equal to that in June. Orders taken by a local turret lathe manufacturer were far ahead of June. Demand is still confined almost wholly to single machines and is well distributed between various industries. Considerable business in single tool inquiry is pending. Much of the demand is for replacement tools to reduce cost of operations.

Gabriel Snubber Mfg. Co., Cleveland, is planning to bring out a new hydraulic shock absorber for automobiles and it is understood will purchase some machinery equipment. Spicer Corporation has purchased additional machinery for its Toledo plant. Timken Roller Bearing Co., Canton, during the week bought a lathe and Diebold Safe & Lock Co., Cleveland, a radial drill.

Plans have been filed by Willys-Overland Co., Toledo, Ohio, for one-story addition to automobile plant, to be used primarily in connection with export production division, to cost about \$250,000.

New York Central Railroad Co., Ohio Central Lines, Cleveland, plans extensions and improvements in docks and terminal at Toledo, Ohio, including a new electrically-operated car-dumping plant and other mechanical terminal facilities, to cost in excess of \$1,000,000. J. R. Scofield, Toledo, is resident engineer in charge.

Vulcan Corporation has been organized by officials of Vulcan Last Co., Portsmouth, Ohio, manufacturer of iron shoe lasts, etc., to take over and expand company. New company has arranged for preferred stock issue of \$2,500,000, a portion of proceeds to be used for extensions. W. J. Burke is president.

Winton Engine Works, Inc., 2116 East 106th Street, Cleveland, is considering plans for two one-story buildings, to cost more than \$50,000 with equipment.

Vilchek Tool Co., 3000 East Eighty-seventh Street, Cleveland, has awarded general contract to Hunkin-Conkey Construction Co., for two one-story additions, 40 x 100 ft., and 30 x 60 ft., to cost about \$40,000 with equipment.

Glenn L. Martin Co., 16800 St. Clair Avenue, Cleveland, manufacturer of airplanes and parts, has engaged Small & Rowley, Terminal Tower Building, archi-

fects, to prepare plans for new plant at Baltimore, at municipal airport to be established by that city, with initial units for parts production and assembling to cost more than \$500,000.

National Air Transport, Inc., Cleveland Airport, Cleveland, is planning construction of new steel hangar, 100 x 120 ft., with repair and reconditioning facilities, to cost in excess of \$75,000, with equipment.

Standard Oil Co. of Ohio, Cleveland, has work under way on new gas absorption plant at local refinery, for reclaiming of gases formed during distillation process, to cost \$50,000 with equipment. Construction has also been started on similar unit at Toledo, to cost a like sum.

Commercial Steel Casting Co. has been formed as sales organization for steel casting division of Osgood Co., Marion, Ohio, which was recently consolidated with former Commercial Steel Casting Co.

Superior Metal Spinning & Mfg. Co., 132 Ontario Street, Toledo, Ohio, has been incorporated to take over business formerly operated by M. W. and J. F. Biringer. Company spins all kinds of metal and specializes in stainless steel, monel metal and non-ferrous products. It is building factory on Fitch Road, West Toledo, and will be in market for some equipment.

Additions to factory buildings and equipment now being made will more than double the present productive capacity of Bunting Brass & Bronze Co., Toledo, Ohio.

Buffalo

BUFFALO, July 30.—Property has been acquired by Kittinger Co., 1893 Elmwood Avenue, Buffalo, manufacturer of furniture, at Los Angeles, for Pacific Coast plant, for which plans will soon be drawn. Initial unit will be one story, aggregating about 400,000 sq. ft. floor space, and is reported to cost more than \$850,000 with machinery. Work will be started immediately on two-story factory branch and distributing plant, totaling about 35,000 sq. ft. of floor space, to be used preliminary to completion of main plant, to cost close to \$100,000. Herbert C. Emmons, 1100 South Oakland Street, Pasadena, Cal., is Los Angeles representative.

An aircraft company to specialize in production of English-type De Havilland-Moth airplanes is in negotiation with Chamber of Commerce, Buffalo, relative to site for new plant, and arrangements are expected to be concluded soon for land on Werle Road. Samuel B. Botsford, general manager, Chamber of Commerce, is in charge of negotiations.

Sun Oil Co., Finance Building, Philadelphia, is said to have authorized plans for construction of storage and distributing plant and office building at Syracuse, N. Y., to replace works recently destroyed by fire, with loss close to \$100,000.

Plans have been filed by Palace Laundry Co., Tenth and Pine Streets, Niagara Falls, N. Y., for one-story steam power plant at Lockport, N. Y., to cost close to \$55,000 with equipment.

James A. Louster and Paul H. Williams, Cazenovia, N. Y., have organized Diepress Co., with capital of \$400,000, to establish local plant for manufacture of dairy machinery and kindred equipment. Operations will begin at early date.

Brockway Motor Truck Corporation, Cortland, N. Y., has authorized plans

for one-story addition, to cost close to \$90,000 with equipment. C. W. Clark, Savings Bank Building, is architect.

Gould Paper Co., Lyons Falls, N. Y., plans rebuilding of portion of mill at Gouldtown, near Lyons Falls, destroyed by fire July 20, with loss approximating \$100,000 including equipment.

Art Work Shop, 828 East Ferry Street, Buffalo, manufacturer of automobile hardware and art metal goods, has filed plans for one-story addition to cost about \$24,000 including equipment.

Precise Products, Inc., Rochester, N. Y., recently organized by Ernest L. White, 60 Brunswick Street, and associates, plans operation of local plant for manufacture of tools, dies and kindred products.

Chicago

CHICAGO, July 30.—Machine tool orders in the past month have been heavier than usual for July, although lighter than in June. Demand is still considered active, although there has been an appreciable decline in inquiries in the past two weeks—a development that is not surprising in view of the vacation season.

Waukesha Motor Co., Waukesha, Wis., which is building a plant addition, has bought a number of multiple spindle drills and is still in the market for special milling and drilling equipment. International Harvester Co., Chicago, has decided to build a caterpillar-type tractor in its local tractor works. Considerable new equipment will be needed for production of this model. Link-Belt Co., Chicago, which is building an addition in this city, is in the market for a few machine tools. J. I. Case Threshing Machine Co., Racine, Wis., which has been a liberal buyer of machine tools in the past half year, has placed orders for two automatic lathes.

Chicago, Burlington & Quincy Railroad has bought an axle lathe and is about ready to close on a few more tools. Missouri-Kansas-Texas recently bought a few machine tools and will soon purchase the remainder of the items on its outstanding list. Missouri Pacific has indefinitely postponed action on inquiries that have been before the trade for some time. Chicago & North Western has issued an inquiry for a Marshalltown motor-driven throatless shear with circle-cutting attachment.

Chicago Board of Education has placed orders for a 16-in. x 6-ft. lathe and a cutter grinder for Washburn Vocational School. Board has also issued inquiries for equipment needed in various junior high schools. Bids on this equipment are to be in on Aug. 2. A list of the more important items follows:

Three motor-driven, 2-wheel dry grinders with 10-in. grinding wheels.

Three motor-driven No. 20 Stanley single-spindle plain-bearing floor-type drilling machines.

Three 11-in. x 4-ft. motor-driven engine lathes.

Three Yates-American motor-driven 30-in. band saws.

Three Yates-American motor-driven No. 1146 two-wheel dry grinders with 1½ x 10-in. grinding wheels.

Three Yates-American motor-driven No. 1, 6-in. bench jointers.

Twelve Yates-American, or equal, No. 12 motor-in-head lathes.

Three Pexto No. 3 squaring shears.

Six Pexto No. 63 bar folders.

Three Pexto No. 1005 cornice brakes.

Three motor-driven 1½ x 10-in. buffers and grinders.

Dallas Brass & Copper Co., 6601 West Grand Avenue, Chicago, has awarded

contract for a one-story plant building, 56 x 320 ft., to cost \$20,000.

Miehle Printing Press Mfg. Co., 1332-58 Damen Street, has awarded a contract for a plant building, 200 x 263 ft., to cost \$450,000.

Trindl Corporation, manufacturer of automobile engine parts, 2917 Wabash Avenue, Chicago, has awarded contract for a one-story plant, 125 x 235 ft., at Aurora, Ill., to cost \$55,000.

Daniel Burkhardtmeir Cooperage Co., 7244 South Chicago Avenue, Chicago, is receiving bids on a three-story addition to cost \$50,000.

Commonwealth Edison Co., 72 West Adams Street, Chicago, has awarded contract for a one-story substation, 50 x 92 ft., to cost \$110,000.

J. A. Sloan, 8259 Green Street, Chicago, has let contract for a one-story boiler room, 50 x 100 ft., to cost \$12,000.

Hart-Parr Co., Charles City, Iowa, machinist and founder, contemplates expanding its plant facilities.

Williams-White & Co., Moline, Ill., are erecting a foundry building, 90 x 260 ft., to cost \$100,000 with equipment.

Waukegan Foundry Co., Waukegan, Ill., contemplates construction of a plant addition.

Plans are being completed by Reiter Co., North Avenue, Elgin, Ill., manufacturer of water softeners, for two-story addition to cost more than \$40,000 with equipment. Bids will be asked on general contract soon.

Koenigsburg & Weisfeld, 155 North Clark Street, Chicago, architects, have asked bids on general contract for new six-story automobile service, repair and garage building, to cost in excess of \$250,000 with equipment.

Mathias Klein & Sons, 3200 Belmont Avenue, Chicago, manufacturers of line-men's tools and other electric power line equipment, have taken title to tract, 173 x 578 ft., on Wrightwood Avenue, and are said to be planning an additional unit.

Plans have been authorized by Ballard Storage & Transfer Co., 16 East Fourth Street, St. Paul, Minn., for four-story and basement automobile service, repair and garage building, with capacity of 300 cars, to cost \$250,000 with equipment.

Ovens, power equipment, conveying and other machinery will be installed in one and three-story plant to be erected by Zinsmaster Baking Co., 97 Sherbourne Avenue, St. Paul, Minn., at Minneapolis, Minn., to cost about \$375,000, for which general contract has been let to Pike & Cook, 416 South Fifth Street, Minneapolis.

Rockford Metal Specialty Co., 624 Cedar Street, Rockford, Ill., manufacturer of automobile hardware, has superstructure under way for two-story addition, 50 x 150 ft., to cost approximately \$100,000 with equipment. Peterson & Johnson, Swedish-American Bank Building, are architects.

A. S. Alschuler, Inc., 28 East Jackson Boulevard, Chicago, architect, has asked bids on general contract for new multi-story automobile service, repair and garage building, 120 x 175 ft., to cost in excess of \$750,000 with equipment.

White Star Refining Co., Wood River, Ill., will rebuild portion of storage and distributing division at local refinery, destroyed by fire July 23, with loss reported in excess of \$150,000 with equipment.

Minnesota Power & Light Co., Power Building, Duluth, Minn., has asked bids on general contract for two-story and basement equipment storage and distributing plant, 80 x 125 ft., with shop

and repair facilities, to cost about \$150,000 with equipment. L. M. Pharis is company engineer.

Ingersoll Milling Machine Co., Douglas and Willoughby Streets, Rockford, Ill., is completing erection of three-story addition, 40 x 210 ft., to cost about \$100,000.

Terminal Grain Corporation, Grain Exchange Building, Sioux City, Iowa, has awarded general contract to Jones-Hettlesater Construction Co., Kansas City, Mo., for an addition to grain elevator to increase capacity 500,000 bu., to cost \$100,000 with equipment. Horner & Wyatt, Board of Trade Building, Kansas City, Mo., are consulting engineers.

Reynolds Electric Co., 2650 West Congress Street, Chicago, manufacturer of fractional horsepower motors and motor-driven appliances, has taken over Korrectolite Co., maker of illuminating products.

Murray Iron Works Co., Burlington, Iowa, engineer, founder and boiler maker, has appointed following district turbine sales managers: Fred H. Dorner, 311 Knapp Street, Milwaukee; Dennis Engineering Co., 243 North High Street, Columbus, Ohio, and Briggs Weaver Machinery Co., Dallas, Tex.

Cincinnati

CINCINNATI, July 30.—Machine tool builders state that July bookings were slightly better than normal, even though sales fell somewhat short of those in June. Two large local manufacturers, whose orders the past month were double those of June, are notable exceptions to the general average. The most interesting feature of the market is that buying has been exceptionally well distributed among various industries, the usual purchases by automobile companies having failed to materialize. However, machine tool companies specializing in high production tools favored by automobile makers state that the amount of pending business in the Detroit district is of fairly good volume.

The Illinois Central is expected to place an order the coming week for rebuilding 25 motor-driven engine lathes. The Southern Pacific has bought three engine lathes and the Louisville & Nashville probably will close on several lathes in the near future. The New River State School, Montgomery, W. Va., is in the market for three lathes, one miller, one upright drill, one shaper, one grinder, one hack saw, one bench grinder and a mandril press. Purchases will be made by the school's industrial education department.

Plans are under way by Armstrong Furnace Co., London, Ohio, recently formed to take over and expand plant and business of Thomas & Armstrong Co., for new plant at Columbus, Ohio, with initial one-story unit to total about 60,000 sq. ft. of floor space. It is proposed to remove considerable equipment from London plant to new location. Entire project will cost more than \$100,000. M. B. Armstrong is president.

Andrew Jergens Co., Spring Grove Avenue, Cincinnati, has awarded general contract to Ferro Concrete Construction Co., Elm Street, for new six-story soap-manufacturing plant, 61 x 150 ft., to cost upward of \$125,000 with equipment.

Common Council, Providence, Ky., is asking bids until Aug. 13 for equipment

for municipal waterworks, including 300,000-gal. capacity steel standpipe, and 200,000-gal. capacity steel tank and tower. C. N. Harrub, Fourth & First National Bank Building, Nashville, Tenn., is engineer.

Air Corps, Material Division, Wright Field, Dayton, Ohio, is asking bids until Aug. 15 for 356 propeller blades, propeller hub lock-nuts, propeller slit hub barrel assemblies, 200 split-hub alloy propeller blades, propeller split-hub sleeve assemblies, aluminum alloy blades, propeller spinner assemblies, etc., circular 62; until Aug. 17 for 288 fuel pump assemblies, circular 60.

City Council, Memphis, Tenn., is considering a bond issue of \$1,600,000, for a municipal grain elevator, with elevating, conveying, screening and other mechanical equipment, and for extensions in railroad facilities at municipal river terminals.

Herring, Hall, Marvin Safe Co., Hamilton, Ohio, has awarded general contract to Edward Honnert Co., Mount Healthy, Ohio, for two one-story additions, 20 x 300 ft., and 20 x 100 ft., to cost more than \$40,000 with equipment.

Detroit, Toledo & Ironton Railroad Co., Detroit, is reported planning new engine house, with repair facilities, and yard extensions at Lima, Ohio, to cost in excess of \$75,000. Work is scheduled to begin in fall.

Standard Ice Co., Knoxville, Tenn., is contemplating new ice-manufacturing plant, to cost approximately \$175,000 with machinery.

Board of Education, Louisville, has secured site at Second and Bloom Streets for new boys' high school, with manual training department, to cost close to \$700,000, for which plans will be drawn by J. Meyrick Colley, Administration Building, Eighth and Chestnut Streets, architect.

Meehan Steel Products Co., Ironton, Ohio, fabricator of structural steel and steel plates and jobber of iron and steel products, has purchased plant of Ironton Punch & Shear Co. and will operate machine shop and foundry on jobbing work, furnishing replacement parts on all machines previously made by Punch & Shear company.

Brass & Aluminum Products Co., Newport, Ky., recently organized, contemplates adding a plating plant to aluminum foundry now operated by T. E. Reynolds Co.

St. Louis

ST. LOUIS, July 30.—Bids will soon be asked on general contract by General Tire & Rubber Co., Akron, Ohio, for three-story factory branch and distributing plant at Kansas City, Mo., to cost about \$200,000 with equipment. Greenbaum, Hardy & Schumacher, Scarritt Building, Kansas City, are architects.

Automatic machinery, conveying and other equipment, will be installed in new plant to be built by Eagle Bottling Works, Inc., 1912 Walnut Street, Kansas City, Mo., on site just purchased, 125 x 130 ft., to cost about \$50,000 with equipment.

St. Louis County Water Co., St. Louis, is disposing of bond issue of \$1,000,000, a portion of proceeds to be used for extensions and improvements in waterworks stations and system.

Parks Airlines, Inc., Missouri Theater Building, St. Louis, is reported having plans drawn for new aircraft manufacturing plant at East St. Louis, Ill., with

initial unit, one story, 200 x 800 ft., for parts production and assembling, to cost in excess of \$300,000 with equipment.

Southwestern Bell Telephone Co., Telephone Building, St. Louis, has revised plans for two-story addition to equipment storage and distributing plant with service, repair and garage extension for company trucks and cars, to cost about \$85,000. I. R. Timlin is company architect.

Universal Cutter Co., 4567 Scott Avenue, St. Louis, manufacturer of cloth cutting machines and parts, has awarded general contract to Woermann Construction Co., Syndicate Trust Building, for two-story and basement plant, 55 x 115 ft., to cost about \$60,000 with equipment. Alfred H. Norris, 11 Dartford Place, Clayton, Mo., is architect.

Board of Education, Maplewood, Mo., is considering installation of manual training equipment in new high school to cost about \$200,000 for which plans will be drawn by William B. Ittner, Board of Education Building, St. Louis, architect.

Gruendler Patent Crusher & Pulverizer Co., 320 North Fourth Street, St. Louis, has filed plans for one-story addition, 100 x 160 ft., to be equipped primarily as machine shop, to cost close to \$50,000.

Tonkawa Petroleum Co., Tonkawa, Okla., is said to have plans for rebuilding portion of local refinery recently destroyed by fire, with equipment installation to include high pressure cracking stills and auxiliary apparatus, to cost more than \$75,000.

Arkansas Power & Light Co., Pine Bluff, Ark., plans installation of 50,000-gal. capacity steel tank on steel tower, in connection with expansion and improvements in waterworks at Risen, Ark.

Parks Air Lines, Inc., East St. Louis, Ill., plans erection of an aeroplane factory adjoining Parks airport, just south of this city.

American Steel Co., East St. Louis, Ill., will spend approximately \$250,000 in next two years on plant improvement. Work on program will commence within 90 days. A number of plant buildings will be torn down and replaced with structures adapted to making a general line of castings. Heretofore company has specialized in railroad steel castings.

Standard Steel Works, North Kansas City, Mo., manufacturer of sheet metal products, including storage and truck tanks for gas and oil, road building equipment, garage and filling station apparatus, will erect an addition, 120 x 305 ft. Company recently was given a contract by United Air Craft Corporation to manufacture aeroplanes.

Mid-West Specialty Co., Little Rock, Ark., incorporated with \$200,000 capital stock, will manufacture a gasoline reserve tank, patented by Dr. Robert H. Gillespie. Factory space has been obtained at Eighth and Izard Streets, and stamping machinery will be purchased.

Indiana

INDIANAPOLIS, July 30.—Plans are being drawn by F. Hilgemeier & Brother, 519 West Raymond Street, Indianapolis, meat packer, for new cold storage and refrigerating plant, to cost in excess of \$125,000 with equipment. T. Quatek is company engineer.

Graham-Paige Motor Co., West Warren Street, Detroit, has awarded general contract to M. J. Hoffman Construction Co., Furniture Building, Evansville, for

several one-story units, each about 90 x 240 ft., at its body-building plant at Evansville, to cost about \$500,000. This will form part of a \$1,500,000 expansion program, including addition to main plant at Detroit and extensions to body manufacturing works at Wayne, Mich.

New England Flexible Door Co., recently formed by G. E. Stevenson and G. C. Coverdale, Indianapolis, have taken option on plant of New England Pin Co., Winsted, Conn., for establishment of new factory. Structures will be remodeled and equipment installed at early date.

J. B. Bayard, 231 Main Street, Vincennes, architect, will soon take bids on general contract for new automobile service, repair and garage building, to cost close to \$100,000 with equipment.

Truck Engineering Co., East Pontiac Street, Fort Wayne, manufacturer of motor trucks, has awarded general contract to Buesching & Hagerman, 402 East Superior Street, for two one-story additions, to cost about \$35,000 with equipment. Guy Mahurin, Standard Building, is architect.

Delco-Remy Corporation, Anderson, manufacturer of automobile starting and lighting equipment, has completed plans for five-story addition, 53 x 168 ft., to cost more than \$90,000 with equipment.

Bastian-Morley Co., manufacturer of hot water heaters, Laporte, will soon build an addition to cost \$100,000.

Chicago Hardware Foundry Co., Elkhart, will soon start construction of an 80-ft. addition to its foundry to provide for a new core room.

Milwaukee

MILWAUKEE, July 30.—New business booked in July by local machine tool builders aggregates a volume considerably in excess of a year ago, and of satisfactory proportions in comparison with previous months this year. Prospects are also considered excellent for local and general revival of new shop construction. Inquiry is active, both for replacement needs and small lots for shop additions now under construction or contemplated. Sources of inquiry are broadly diversified.

Allis-Chalmers Mfg. Co., Milwaukee, which some time ago acquired entire interests of Monarch Tractor Co., Springfield, Ill., is contemplating a 100 per cent increase in production facilities of this division. It has not yet been decided if new shops are to be erected at Springfield, or entire operation transferred to main works in West Allis, Milwaukee. If this is done, a large group will be built. Monarch division builds heavy tractors, while tractor division of West Allis works specializes in lighter types for agricultural purposes.

Nash Motors Co., Kenosha, Wis., has placed general contract with Nelson & Co., Racine, Wis., for erection of a one-story addition, 63 x 238 ft., to Special Six works at Racine.

Board of Vocational Education, Green Bay, Wis., is having plans drawn by Foeller, Schober & Berners, local architects, for new \$100,000 manual training school, 120 x 150 ft., three stories and basement. Harvey Stewart is secretary of board.

Seaman Body Corporation, 1732 Richards Street, Milwaukee, division of Nash Motors Co., Kenosha, Wis., and manufacturing inclosed automobile bodies, has

acquired 20 acres near its present factories for future development. No decision has been made with respect to time of undertaking new construction. A \$250,000 addition was made early this year.

North End Foundry Co., 700 Sixtieth Avenue, West Allis, Milwaukee, is erecting a one-story shop addition, 47 x 80 ft. W. O. Krahn, 606 Fifty-first Street, Milwaukee, is general contractor.

Immel Construction Co., Fond du Lac, Wis., has general contract to erect a forge shop, 145 x 180 ft.; three-story warehouse, 96 x 125 ft., and a three-story elevator addition, 30 x 40 ft., for Van Brunt Mfg. Co., Horicon, Wis., division of Deere & Co., Moline, Ill. O. A. Eckerman, Moline, is chief construction engineer.

Strasburg Construction Co., Blackhawk Boulevard, Beloit, Wis., will erect a two-story factory, 40 x 100 ft., and a one-story shop, 50 x 100 ft., for manufacture of sash, doors and interior trim and hardwood specialties. Investment in buildings, tools and machinery will be about \$60,000.

Wisconsin Power & Light Co., 16 North Carroll Street, Madison, Wis., will build four new substations at a cost of about \$45,000. Sites have been acquired at Stoughton and Spring Green, Wis. E. J. Kallevang is chief engineer.

Magnetic Mfg. Co., Milwaukee, manufacturer of magnetic separators and special magnetic equipment, is in market for a 24-in. heavy-duty lathe.

Gulf States

BIRMINGHAM, July 30.—Plans have been approved by Wackman Welded Ware Co., Sawyer Street, Houston, Tex., for new one-story plant, to cost close to \$55,000 with equipment.

Common Council, Boerne, Tex., is asking bids until Aug. 8 for equipment for municipal waterworks, including 75,000-gal. elevated steel tank and tower. Terrell Bartlett Engineers, Inc., Calcasieu Building, San Antonio, Tex., is engineer.

Miller Refining Co., Wichita Falls, Tex., has been acquired by new interests, headed by J. J. and Meyer Taxman, who contemplate extensions and improvements in oil refinery, including installation of additional equipment.

International Paper Co., 100 East Forty-second Street, New York, has approved plans for group of units for kraft paper mill at Mobile, Ala., including main mill, 100 x 780 ft.; machine shop, 58 x 120 ft.; evaporating unit, 97 x 98 ft.; recovery room, 113 x 199 ft.; power house and other buildings. Entire project is reported to cost more than \$3,500,000. R. J. Cullen is vice-president, in charge.

Board of Commissioners, Boca Raton, Fla., will receive bids until Aug. 15 for pumping station and water treatment plant for municipal waterworks, capacity 500,000 gal. per day. Plans and specifications at office of Beulah Butler, town clerk; and H. S. R. McCurdy, 762 Lancaster Avenue, Bryn Mawr, Pa., consulting engineer.

Ponchatoula Ice Co., Ponchatoula, La., recently acquired by new interests, has plans for an addition to ice-manufacturing and cold storage plant, 100 x 200 ft., to cost more than \$65,000 with equipment. X. A. Kramer is head.

Amarillo Producers & Refiners Corporation, Amarillo, Tex., J. W. Warthar, head, is planning construction of new oil

refinery in vicinity of Pyote, Tex., with initial capacity of about 3000 bbl. per day, to cost close to \$200,000 with equipment.

State Building Commission, Jackson, Miss., is planning a steam-operated electric power plant at Oxford, Miss., to cost close to \$40,000 with equipment. Frank P. Gates, Edwards Hotel, Jackson, is architect.

Palmer Electric Sign Co., 20 East Forsyth Street, Jacksonville, Fla., is planning installation of equipment in local building, including metal-working machinery, shears, etc.

City Council, Jacksonville, Fla., is having plans drawn for an automobile service, repair shop and garage for municipal trucks and cars, to cost more than \$70,000 with equipment. City engineering department is in charge.

Phelps & DeWees, Gunter Building, San Antonio, Tex., architects, have plans for three-story automobile service, repair and garage building, 110 x 125 ft., to cost close to \$150,000 with equipment.

Tuscaloosa Ice & Cold Storage Co., Tuscaloosa, Ala., will make extensions and improvements in ice-manufacturing and cold storage plant, including installation of additional equipment, to cost about \$50,000.

Town Council, Kaplan, La., will receive bids until Aug. 14, for equipment for municipal electric light and water plant, including Diesel oil engine with capacity from 150 to 200 b.h.p. direct-connected to electric alternator, 2300-volt, 60-cycle, 3-phase, with belted exciter and direct-driven exciter; one 500-gal. per min. direct-driven pumping unit, with starter and accessories. C. H. Brookshire is town clerk.

Texas Pipe Line Co., Houston, Tex., has awarded contract to Saigh Engineering Co., Houston, for installation of 8-in. welded pipe line from Corsicana to San Augustine, for oil service, connecting with line from Port Arthur to San Augustine. Work will include installation of booster stations and other mechanical equipment.

Gulf States Paper Corporation, Tuscaloosa, Ala., has let contract to United Engineering & Construction Co., Philadelphia, for steam power plant to cost approximately \$600,000.

Prest-O-Lite Co., Birmingham, has let contract to Smallman Construction Co., Birmingham, for new plant to cost about \$50,000.

Pacific Coast

SAN FRANCISCO, July 25.—Lok-S-Top Fixture Co., Los Angeles, has leased one-story factory, 85 x 150 ft., to be erected on McKinley Avenue, and will equip for manufacture of metal specialties, to cost more than \$25,000. General building contract has been let to Ted R. Cooper, Inc., Western Pacific Building.

Electric Steel Mfg. Co., 3334 East Slauson Avenue, Vernon, Los Angeles, has taken out permit for one-story addition.

Kenneth Macdonald, Jr., Spring Arcade Building, Los Angeles, architect, has plans for twelve-story automobile service, repair and garage building, 75 x 156 ft., to cost in excess of \$450,000 with equipment.

Municipal Light Department, County-City Building, Seattle, has engaged Joseph Wilson and Paul Richardson, Henry Building, architects, to prepare plans for two-story and basement power substation, with equipment storage and repair facilities on upper floor, to cost upward of \$450,000 with machinery.

Oregon Canning Co., Lebanon, Ore., is considering rebuilding of portion of plant destroyed by fire July 24, with loss close to \$300,000 including equipment.

F. A. B. Mfg. Co., Oakland, Cal., manufacturer of pumps, parts, etc., is having plans drawn for one-story addition to plant at Emeryville, to cost about \$24,000 with equipment. McWethy & Greenleaf, 2710 Telegraph Avenue, Oakland, are architects.

Board of Education, Escalon, Cal., has approved plans for a one-story manual arts building at local high school, to cost close to \$30,000 with equipment.

Board of Education, Los Angeles, has authorized plans for one-story manual arts shop addition at James A. Garfield High School, to cost more than \$40,000 with equipment. Architectural division is in charge.

Hill-Mills Co., Spokane, Wash., representative for Cleveland Tractor Co., has plans for one-story plant, 50 x 150 ft., to cost about \$25,000 with equipment; unit will be used for parts, repairs and other service. Wells & Bertelson, Hyde Building, are architects.

Biles-Coleman Lumber Co., Omak, Wash., has authorized plans for a one-story addition to mill to cost approximately \$200,000 with machinery.

Canada

TORONTO, July 30.—Sales for the week, while confined mostly to single tools, covered many lines of industry and were in sufficient volume to maintain the former high weekly average. While current demand is mostly for replacement, orders for two or three units are appearing for garages and automobile repair plants. Inquiries are also being received for tools and equipment for new industrial plants, and it is expected that by the first of September builders and dealers will be well supplied with orders on new works account.

Ratepayers of Oakville, Ont., have carried by-laws in favor of establishing two new industries there, namely General Metal Devices, Ltd., and General Tire & Rubber Co. Manufacturing plants will be erected immediately.

John Evans, Water Street, Galt, Ont., is preparing plans for a one-story addition to plant of Dominion Tack & Nail Co.

C. Huet, 5039 Sherbrooke Street West, Montreal, is having plans prepared for erection of a five-story cement plant, concrete and brick construction, and is interested in prices and machinery.

Fittings, Ltd., 135 Spruce Street, Oshawa, Ont., manufacturer of chain belting, etc., will build an addition to cost \$40,000.

Shawinigan Chemical Co., Shawinigan Falls, Que., contemplates following construction in connection with its plant: Transformer building, lime kiln building to cost \$270,000, addition to grinding plant to cost \$55,700, new water line on Transmission Avenue to cost \$60,000, cooling room to cost \$50,000.

C. Lloyd & Son, Wingham, Ont., will build an addition to their wood-working plant and will require machinery and other equipment.

National Standard Co., Guelph, Ont., has awarded contracts in connection with \$12,000 plant addition for manufacture of wire braid, etc.

I. T. S. Rubber Co., of Canada, Ltd., 30 Alpine Avenue, Toronto, Ont., has awarded contracts for an addition to its plant, to cost \$80,000.

Phillips Plate Glass Co., Ottawa, Ont., contemplates erection of a manufacturing plant at Regina, Sask.

Western Canada

M. Peterson, City Clerk, Winnipeg, Man., will receive bids until Aug. 13 for two main hydraulic turbines and two service turbines to be installed at Slave Falls; plans with Hydro Electric System, 85 Princess Street, Winnipeg.

Foreign

IN connection with hydroelectric power project on Dnieper River, Russia, for Soviet Russian Government, now in progress, and estimated to cost \$85,000,000 with transmission system, purchases of additional equipment will be made under direction of Col. Hugh L. Cooper,

101 Park Avenue, New York, consulting engineer. During past year machinery in amount of \$1,500,000 has been purchased, and future expenditures for final completion are estimated in excess of \$15,000,000. Amtorg Trading Corporation, 165 Broadway, New York, is official buying agency for Soviet Government.

Department of War, The Hague, Netherlands, has authorized appropriations totaling close to \$100,000 for purchase of aeronautic equipment for Netherlands, East Indies, during 1929.

Power Securities Corporation, Ltd., London, England, has secured a concession for furnishing electric light and power and water in Palestine district, vicinity of Jerusalem. Information at office of Bureau of Foreign and Domestic Commerce, Washington, reference Palestine No. 281817.

Fabrique Nationale D'Armes De Guerre, Herstal, Liege, Belgium, plan to install a battery of steam or compressed air stamping hammers, of various powers, as follows: 8000, 6000, 3500, 1750, 1000 and 750 lb. Particulars on use, and respective advantages and disadvantages of the two fluids are desired, considering the alternate systems in their entirety from the boiler or compressor, as the case may be.

Aeroindustry Stratus, Stockholm, Sweden, recently organized to manufacture aircraft and parts, has acquired a factory at Kungsor, near Eskilstuna, and plans early establishment of new plant for parts production and assembling, as well as aircraft motors ranging from 80 to 450-hp. rating. Company has requested loan of National Swedish Government in amount of 160,000 crowns (about \$41,000) to provide for initial operations.

Machinery Exports Ahead of Last Year

Six-Month Total Exceeds 1927 by 13 Per Cent—Imports Running Behind the First Half a Year Ago

WASHINGTON, July 27.—Exports of machinery aggregated a value of \$43,098,072 in June, against \$44,670,652 in May. For the six months ended June 30 they were valued at \$239,760,570, against \$212,116,959 for the corresponding period of last year. In June, 1927, exports of machinery were valued at \$34,192,252. Exports of industrial machinery in June were valued at \$20,031,155—slightly under May, when the value was \$20,274,976. For the first six months, exports of industrial machinery were valued at \$109,213,866, as compared with \$100,121,242 for the first six months of

1927. For June of last year exports of industrial machinery were valued at \$15,834,223.

Exports of power-driven metal-working machinery in June were valued at \$2,358,324, against \$1,970,348 in May. For the first six months exports of this class of equipment were valued at \$12,146,706, against \$8,728,733 for the corresponding period of last year. In June of last year exports of power-driven metal-working machinery were valued at \$1,496,908.

Exports of power-driven metal-working machinery as listed in THE IRON AGE table totaled 871 units, val-

ued at \$1,479,944, in June, compared with 724 units, \$1,235,109 in May.

Total imports of machinery and vehicles in June were valued at \$2,532,494, against \$2,424,688 in May, and \$2,293,115 in June of last year. For the first six months the values were \$13,934,429 in 1928 and \$15,331,523 in 1927. Imports of industrial, office and printing machinery in June were valued at \$1,745,826, against \$1,457,391 in May, and \$1,370,498 in June of last year. For the first six months they were valued at \$8,430,630, against \$9,058,831 for the first half of 1927.

THE IRON AGE

New York, August 9, 1928

ESTABLISHED 1855

VOL. 122, No. 6

Manufacturing Expense Control at Stutz Motor Plant

BY L. A. BARON

FOR several years the Stutz Motor Car Co. of America, Inc., has used a general budget plan. Expenses are divided into different schedules, one of which is "direct manufacturing expenses." Under this arrangement department heads are held responsible for the amount of expenses on each schedule, while the production manager is accountable for all of the operating costs in the entire plant.

The tying in of actual manufacturing expenses with the budget gave us more trouble than all other schedules combined. We found it necessary to dig into history to find the reasons why our expenses were over or under the budgeted amount. Previous to the adoption of our present plan several methods of trying to hold foremen responsible for the expenses of their departments had proved unsuccessful, because each was lacking in the proper scale of measuring expenses as compared with departmental production.

Budget, Applied Jan. 1, 1928, to 36 Departments, Pays Dividends —Standard-Time Wage Incentive Plan Employed in Place of Piece Rates

Our present plan, put into effect Jan. 1, 1928, is administered by the production manager working through the comptroller. In developing the plan it was thought that if foremen were sold on the idea of spending only a certain amount for each item of expense, they would be able to keep costs within a limit set by the management. The main problem was to determine the limit, which should be sufficiently flexible to allow foremen lee-

way to operate their departments to the best advantage of the plant as a whole.

Budget Rates Based on \$100 of Payroll

Throughout 1926 and 1927 our cost department kept accurate individual expense accounts with each manufacturing department. We had a manufacturing expense ledger divided into departments and under each department was a separate account for each expense of that department.

L. A. BARON, author of this article, is comptroller of the Stutz Motor Car Co. of America, Inc., Indianapolis, a position to which he was appointed in April, 1928, after having served as budget comptroller since June, 1927. He has been identified with the automobile industry for 15 years, first in the employ of the Searchlight Gas Co., which supplied acetylene gas for automobile lighting purposes, and then, after serving in the United States Army during the war as first lieutenant in field artillery and aviation, with the Tymann Re-Manufacturing Motors Co. as auditor. Later he was associated with the Marmon Motor Car Co. as a cost accountant and in December, 1925, was made director in charge of the cost, timekeeping and pay roll department of the Stutz company. Mr. Baron is the present secretary of the Indianapolis chapter of the National Association of Cost Accountants.

March 1, all rates would be revised, the performance for January and February being taken as a basis. As a consequence, the results in March showed considerable change from the two previous months.

Weekly Reports Permit Foremen to Correct Conditions Promptly

To enable foremen to correct conditions in their departments as soon as possible the management puts into their hands a weekly report on their performance. This report, the form of which may be noted from the accompanying illustration, goes to the foreman within ten days after the close of the pay period. This "weekly budget performance" sheet contains the budget for the week, the actual expenses, and the savings or losses, with the same information cumulative for the month. The details of the department expenses are compiled and a condensed report placed before the general manager and the production manager each week. On both departmental reports and the condensed report the budget and the savings are inserted in black and all losses in red.

When the weekly reports are sent out by the management, a general letter covering the performance for the week is dispatched to all foremen. The letter gives the standing of each department for the month to date and warns all foremen to bear down on all expenses which are showing up in red on the condensed report. In fact, the foreman of any department having a net red figure for the month is asked to report to the comptroller and explain the reasons for his failure to attain a better record. These explanations, gathered each week, are written up in a general report by the comptroller, who submits it to the management with the monthly operating statements. This method eliminates the necessity of digging into past history at a later date to account for the various figures.

The plan just outlined has produced valuable results. In the best quarter of 1927, that ended Sept. 30, manufacturing expenses were 63.11 per cent of the total factory payroll, whereas in the quarter ended March 31, 1928, these expenses dropped to 51.5 per cent, a saving of 11.61 per cent thus having been effected. We estimate that the experiment in controlling manufacturing expenses has paid about

THE Budget Committee, consisting of the Comptroller, Production Manager and His Assistant, is Empowered to Revise Budget Rates to Comply with Changes in Production Procedure and Other Special Conditions. The committee also proposes names for the special monthly prize of \$25

STUTE

March 10, 1928.

DETAIL OF ELEMENTS COVERED

DESCRIPTION

1.

Operator picks up (3) Crankcases from floor (1) each time, place same in fixture on table of machine, tighten all bolts and clamps, advance work to cutters -- start feed.

2.

Rough and finish mill, lugs, top and bottom face, and bearing locks to size.
Note: On Sub-Operation #2, Operator finishes clamping other (2) crankcases on table, removes (2) finished parts, place on floor.

3.

Operator throws out feed, and removes other part, place on floor with air hoist, back up table to load.

EVERY Operation in Each Department Is Time Studied and the Result Transferred to "Standard Time Allowance" Sheets of the Form Shown Above. Total time-study time is made up of the actual operating time plus contingency time. To this is added 25 per cent for bonus and the total of the two is the "standard time." If with a standard time of 100 min. and time-study of 80 min., the job is done in 80 min. the operator is entitled to a bonus of 25 per cent

ON the Reverse Side of the "Standard Time Allowance" Sheets Is Recorded Detail Elements of the Particular Operation as Shown at Top of Page

65 times the investment in prizes of \$100 a month. It has required less than the full time of one clerk to keep the records.

By this method of budgeting we are controlling the following list of manufacturing expenses in 36 factory departments:

Labor and Material Losses: Reoperations on account material shortage, salvage expense, material losses, uncontrollable labor losses, salvaging vendor defects, idle time, day rate guaranty.

Shop Supplies: Waste and wiping rags, oils and greases, gasoline and kerosene, perishable tools and abrasives, electrical supplies, general shop supplies.

Indirect Labor: Foremen and assistants, production control clerical, time study, tool design, watchmen and elevator men, shop clerical, process inspection, receiving inspection, final inspection, toolroom attendants, storeroom attendants, receiving room labor, department stock handling, car loading labor, firemen, oilers, sweepers and janitors, tool grinding and sharpening, layout work, set-up time, time-keeping, cost and payroll, payroll variations.

Other Indirect: Athletic and welfare, and other miscellaneous expense.

In connection with our budget system, we are using a productive labor plan, the basis of which is standard time with a bonus for performance in less than standard time. Every operation in each department is time studied and to the time study is added a reasonable allowance for stock handling, tooling, etc., this allowance being also based on a time study observation. The allowance and the actual time added together constitute what we call "time-study time," as shown on the "Standard Time Allowance" form reproduced herewith. To the time-study time is added 25 per cent for bonus, the total of the two making up "standard time."

Each operation bears a standard hourly rate, which is the prevailing rate paid in this territory for the particular class of work being done. Standard time multiplied by the standard hourly rate gives us our standard cost.

Performance is paid for on the following basis: All jobs completed between standard time and time-study time are paid for at the standard cost. Worked out on a percentage basis, this would figure out in the following manner: If the standard time is 100 min., time-study time would be 80 min. When the job is done in 80 min., there is a saving of 20 per cent of the standard time, which entitles the operator to a bonus of 25 per cent.

All operations completed in less than time-study time are paid for on the following basis: Actual time plus 25 per cent of the actual time plus 50 per cent of the time saved between the actual time and the time-study time. For example, an operator saving 30 per cent of standard time would be paid 132.16 per cent of the standard hourly rate for the job. When the time to complete an operation is more than the standard time, the operator is paid the standard hourly rate for the time taken to do the work.

To facilitate payroll accounting we have worked out a step-rate schedule based on savings of 2.5 per cent, each saving of that amount taking a higher rate of pay. These jumps are always an incentive for operators to better past performance.

Cost Reductions Credited Against Department Expense

A 30 per cent saving in standard time lessens the cost of the product 7.5 per cent, the reduced cost reverting to the department as a credit against department expenses. A 10 per cent increase in time over standard time increases the cost of the product 10 per cent. This increased cost is charged to the department as an expense. With the foreman receiving a credit for savings and being charged up on his budget with losses, we have his constant cooperation in seeing that all operators make as high a daily rate as possible.

With this article is printed a chart showing the time-study time, actual cost and standard cost based on a standard time of 100 min. and a standard hourly rate of 60c. This plan of pay is applied to individual workers, two-man teams and gang work. The following rules govern operations paid for on a gang basis:

1. On all assembly lines.
2. On all progressive lines of operation.
3. Where the task requires the labor of more than one operator.

4. Where labor of more than one operator of a department is habitually employed to complete all department operations on a part or unit.

5. Where like workers or machines are grouped together for the purpose of performing like operations on different parts or units.

This method is now being introduced and is supplanting individual and group piece work. We are selling the idea to the employees on the basis of earnings per hour instead of price per piece. We hire our employees at so much per hour and we find from past experience that new employees coming into the shop are interested primarily in their possible hourly earnings, not in price per job. In the departments where it has been installed it is meeting with success and we are receiving the cooperation of both the operators and the foremen.

CHART Showing the Time-Study Time, Actual Cost and Standard Cost Based on a Standard Time of 100 Min. for the Operation and a Standard Hourly Rate of 60c. This standard-time wage incentive plan applied to individual workers, two-man teams, and gang work

Stainless Steel Chain to Strengthen London Cathedral

A stainless steel chain will girdle the dome of St. Paul's Cathedral, London, at the base of the famous whispering gallery, as a part of the strengthening work now in progress. The chain, which is now practically completed at Brown Bayley's steel works, Sheffield, England, has a length of 450 ft. and weighs over 33 tons.

Each link of the chain is composed of three or four solid bars 14 ft. 8 in. long. Originally a much bulkier chain had been designed by the contractors, but the steel plant was able to economize in bulk and weight.

Steel Building Enlarged By Welder

Floor Area and Height Increased By Welding Reinforcements and Connecting Beams to Old Structure—
Minimum Damage to Plaster and Interior Trim

AN interesting example of how structural welding may be used to advantage when enlarging or remodeling an old steel-frame building may be drawn from work on the Rose Building, Cleveland, done by the Forest City Structural Steel Co. This six-story building was erected in 1898, and the owners intended not only to increase its ground area, but to carry the old portion up four more floors, notwithstanding the fact that the existing columns were not designed for this extra load. A further

a four-story H-column and the latter attached to it by edge welds.

The beams which carried the roof of the low section of the building were not of sufficient size to carry floor loads. To give them the necessary strength without disturbing the ceiling of the sixth floor, track rails were welded to the top flange of the existing beams as shown in one of the cuts. The flange of the rail was trimmed to $3\frac{1}{2}$ in. wide, so the upper flange of the I-beam would give the necessary sup-

Old Column Reinforced by Dropping Angle-Iron Cross Down Open Center and Welding in Place with Tie Plates

complication rested in the fact that the drawings showing the steel details had been lost.

It would have cost much money to uncover enough steel to enable joints between the existing steel and the new beams to be detailed and riveted in the conventional manner. Furthermore, tenants (mostly doctors and dentists) would have been disturbed or even temporarily dispossessed. This situation was met by uncovering only a small area of steel at each joint, measuring the connection to the new frame work, cutting a member in the field with an oxy-acetylene blowpipe, and then welding this connecting member to the exposed face of the old steel. Lincoln Stable-arc machines were used for this field welding. Most of these connections were made unknown to the tenants behind the curtain wall.

Reinforcement Placed Inside Columns

Reinforcement of the old columns was also done with a minimum of disturbance to plaster and interior finish. They are of the Gray type, made up of eight tees held together by straps riveted to the legs of the tees; thus the columns had an open center. To stiffen them and give them greater load bearing capacity, sections in the shape of a cross made up of four angles were inserted down this hollow center. The new steel was then joined to the old at five-foot intervals by plates welded to the legs of the angles and to the legs of the old tees.

A cross section of the strengthened section is shown in an accompanying drawing. To extend this column upward, it was cut off square, and a $1\frac{1}{2}$ in. cap plate welded to the supporting steel. This cap plate served as a base plate for

Roof Beams Strengthened Without Disturbing Ceiling Below by Welding Rail to Top Flange

port for the weld metal, and enable the workman to weld in the "down" position.

Welded steel bar joists are used in the new addition. These are held in position by welding the ends of each joist to the beams. The joists are tied transversely by welding a half-inch round rod to their bottom chords.

Operators were required at intervals to weld samples which were tested to satisfy requirements imposed by the local building commission.

Visual Inspection of Each Weld Insured Uniformly Good Work

By such methods the owners were enabled to receive full rentals from the old part of the building, and the tenants were discommoded to the minimum extent—either in having the interior trim of their rooms wrecked, or in being disturbed by noisy rivetting operations.

Mass Production Limited by Demand

Output en Masse Circumscribed by Restricted Markets

—Relatively Few Businesses Lend Themselves to Mass Manufacture

"THE idea that mass production is an unfailing key to wealth is a mistaken one," said Charles Piez, chairman Link-Belt Company, Chicago, when interviewed by a staff representative of *THE IRON AGE*. "The fact is overlooked that relatively few businesses lend themselves to mass production. A large proportion of the work of the Link-Belt Company, for example, is of a jobbing character, i.e., the building of equipment to meet special specifications.

"Even in industries where mass production methods can be employed, output is definitely limited by demand. To be sure, in some fields markets can be further expanded without great expense. It is no longer necessary to create a demand for automobiles. Every normal person wants to own a motor car, and it is only necessary to build one that he can afford to buy.

Lower Costs Do Not Guarantee Larger Sales

"But, because the automotive industry can cut costs and expand its market by producing en masse, it does not follow that other manufacturing lines can increase sales following a reduction in costs. In the materials-handling field, for instance, it would be absurd to assume that a price cut of a few hundred dollars would enlarge the demand for steam shovels or conveyors. Even in long established mass production industries, such as flour milling and beef packing, there are distinct limits to market expansion. As a matter of fact, the per capita consumption of flour and beef is only about four-fifths as large as before the war. The habits of the public have changed; mixed diets, including more fruit and vegetables, have replaced the former standard fare of roast beef, potatoes and bread. The gain in demand that would follow further cost reduction in milling and packing would doubtless be insignificant."

"Bituminous coal mining is another outstanding example of an industry that has a restricted market. To a large extent building, together with the industries dependent on it, is confronted with the same condition. The replacement of small buildings by skyscrapers in the Chicago Loop district is definitely limited by the area available. Granting that such construction will continue outside the present Chicago business district, it is doubtful whether the rate of replacement will be so rapid, with the advantages of central location lacking.

"The fact that output cannot be increased ad libitum is often overlooked in mass production industries. The economies from large-scale output are a constant temptation to

increase production first and worry about sales afterward. Efforts to sell goods in excess of consumption have added very considerably to the costs of marketing. In most industries, including those outside of the mass production field, distribution has become a major problem. In our own

company we have been conscious of a decided increase in the cost of selling in the past few years.

"Selling programs of the future must encompass a more scientific study of markets. Merchandising must be made more effective. Futile efforts to overcome the insurmountable must give way to the more intelligent cultivation of markets that can be captured. If building were declining, it would be foolish for a maker of shovels to try to increase his sales by an extensive advertising campaign. No advertising expenditures that he could make would succeed in reversing an economic trend.

Ineffective Merchandising Sometimes Handicaps a Whole Industry

"Lack of effective merchandising frequently causes a manufacturer or a whole industry to lose ground. The steel industry was among the first to develop mass production, but it now finds its market limited to a greater extent, in all probability, than would have been the case if its merchandising problem had received the same attention that was given to operating technique. It is now clear that the steel mills permitted the cement industry to outgeneral them in aggressively promoting the use of reinforced concrete.

"The problem of getting products to the ultimate users is not solved by high-pressure selling that merely moves goods from manufacturers' warehouses

to secondary hands. Goods must be wanted by the final buyer. Sales departments should make a careful research of markets before, and not after, production programs are inaugurated or plant expansion is undertaken.

Surplus Capacity Dictates Greater Cooperation

"While market study can be profitably pursued in all lines, the fact remains that most industries have surplus capacity and should control their output accordingly. Our own company could build more than it can sell, but, if it did so, it would be in red figures.

"There is no question that the Government must permit greater cooperation among competitors, particularly in those industries where excessive production not only wipes out profits but threatens their very integrity. Trade associations have done much by distributing information regarding consumption, sales and production. When sales are declin-

"THE idea that mass production is an unfailing key to wealth is a mistaken one. Relatively few businesses lend themselves to mass production, and even where mass methods can be employed, output is definitely limited by demand."
CHARLES PIEZ.

ing there is less temptation to slash prices if a company knows that it is holding its customary share of the total business done. The leavening effect of the trade association has been supplemented by the good work of the Department of Commerce in promoting economies through standardization and simplification.

Consolidation Only Alternative to Cooperation

"The only alternative to greater cooperation is consolidation. Mergers are desirable among companies making the same or closely allied goods, especially products sold by the ton. There is little doubt that if one company owned all the steel plants in this country steel could be sold more cheaply. When a great number of varieties of products are made, consolidation is less advantageous. Even in the case of such plants, mergers are sometimes economic. In 1906 three companies having much the same owning interests consolidated into the present Link-Belt Co. This merger benefited both ourselves and our customers. One management replaced three, a single branch office sufficed where two were formerly needed, and advertising expenditures, although double those of any one of the three merged companies, nevertheless fell below the previous combined outlay.

"The attitude of the general public toward mergers and trade associations has changed. It is no longer feared that prices will be raised to an unduly high level. Expansion of business can come only with the improvement of products and further reduction in costs. Extortionate prices would be an invitation to enterprising capitalists and executives to enter the field. Moreover, the stamping out of competition would probably result in Government control, an eventuality that industries seek to avoid. Nor is inter-industry competition to be forgotten. Excessively high prices in certain fields would tend to divert business to other industries.

Dominant Group of Stockholders Desirable in Large Company

"Consolidations, in my opinion, are well worthwhile in the automobile industry. In some other fields it is conceivable that mergers might become so large as to be unwieldy. Large companies with ownership widely diffused always run the risk of supplying insufficient incentive for progressive management. American stockholders are singularly apathetic, and there are distinct disadvantages in the impersonal touch of a hired management. I have always believed in the responsibility of stockholders. In a large organization it is desirable to have a group of stockholders dominating the company, such as the DuPont interests in the General Motors Corporation. Where there are no dominant owning interests it is well to encourage the management to acquire a real stake in the form of stock or a percentage of the profits. Profit-sharing is criticised because it tends to foster a driving type of management that fails to build up proper reserves or to keep plant and equipment in up-to-date and good working order. A similar self-interest manifests itself in piece-rate work, but just as the piece-rate method of wage payment calls for closer inspection of the product, so must a profit-sharing management be under closer control of the board of directors.

There Is No Fixed Buying Fund

"The problem of production, of course, is intimately connected with the problem of consumption. The development of new products and new uses for products brings about additional employment and greater purchasing power. There is no fixed buying fund. It is wrong to assume that the public has only so much to spend and that the fight is for the buyer's extra dollar. If you can create a new demand, the necessary buying power seems to be there.

"While this is broadly true, it should not lead to a misconception of the significance of the wage problem. The employer's responsibility to his workmen consists in pro-

viding them with steady work, under sanitary conditions, at the best possible wages. But to those who have to meet 52 payrolls a year, in the face of keen competitive conditions, the responsibility is by no means a light one.

Rise in Wages Has Been Natural

"In our industry and industries allied with it we have not consciously raised wages to maintain or increase the purchasing power of labor. Wages have had a natural rise. In 1914, when Ford raised wages of common labor to \$5 a day, he did it because he had an unlimited market and needed greatly expanded production. During the war and in the post-war period opportunities for higher wages appeared and, no doubt, did much to improve the relations between management and labor. It became clearer that employers and employees have a common stake in industry and that their fortunes rise and fall together. Management has generally accepted the view that wage reduction should be the last step in any business recession. It has, therefore, concentrated its attention on reducing labor costs through the increased use of labor-saving equipment. Such equipment was not introduced to raise the wage level; rather wages rose first and industry then set out to beat them—not by wage cuts, but indirectly through better methods and improved machinery.

Scientific Research of Prime Importance

"Economies in manufacturing have been forced by the high labor market and, naturally, have been prompted also by a desire to expand markets. Such great progress has been achieved in the development of more efficient methods and equipment that manufacturers have come to realize the prime importance of supporting scientific research in an effort to find new short cuts in cost reduction.

"The emphasis on lower costs has been matched by the attention given to financing buying. It is safe to say that the time on instalment payments on automobiles has been doubled in the past few years, thereby enabling many thousands of people with smaller incomes to purchase cars. Consumer purchases of mass production goods may be adversely affected by the decline in our stock of gold and recent advances in interest rates. Human nature must be considered in this connection, however. The check on instalment buying may be like the attempted check on brokers' loans. In other words, obstacles are often ineffective when a man wants something.

"The general effect on business of the outflow of gold cannot be appraised at this time, but it is not an unreasonable assumption that the return of the metal to countries that have long had a deficient supply will bring about a steadier and stabler world money market, to the ultimate benefit of this country."

"Zeolite Water Treatment" is the title of a reprint issued by the Department of Engineering Research, University of Michigan, Ann Arbor. The paper was read before the American Water Works Association. It is devoted to a water treatment system used in the heating plant of the Detroit Edison Co. The conclusion is that the system operates satisfactorily under careful supervision and that it is reasonably safe. The use of phosphoric acid gives less carbon dioxide in the steam and less caustic alkalinity in the boiler. It is believed that this phosphoric acid will eliminate scale in the tubes of the boiler.

"A Little History of Marking Devices" is the title of a 24-page pamphlet of unusual type issued by the Noble & Westbrook Mfg. Co., Hartford, Conn. The booklet illustrates a large number of nationally known trademarks, classifies the types which may be registered and tells how they may be attached to the various articles of consumption. Copies of this booklet may be had undoubtedly on request.

Automatic Cadmium Plating

After Brake Bands Are Racked and Placed on Hangers,
Further Passage Through Washing and Plating
Baths Is Entirely Automatic

BY FAY LEONE FAUROTE*

DEMAND for automatic plating has come naturally with mass production of exposed machine parts needing a protective or ornamental covering—especially from the automotive industry. Here beauty of ex-

In the old way of doing things this section of the manufacturing gamut was usually relegated to an outside shed with a dirt, cinder or slat floor. The place was often wet, the ground damp, the air full of unpleasant fumes. The

At Left—Semi-Automatic Equipment for Plating and Washing Small Parts

Below — Revolving Telescope Arms Above Conveyor Lift Hangers from Tank to Tank

ternal appearance vies with long life of the mechanism in the race for sales supremacy. Stainless steels and protective coatings have been so widely used in other industries that motor car manufacturers have been forced to adopt better and more permanent methods of rust prevention. Most automobile parts subject to oxidation and apt to have their efficiency impaired are now being covered with copper, brass, nickel, chromium or cadmium.

Automatic Equipment Makes for Neatness

Among the several interesting machines recently introduced into the Ford Motor Co. shops for manufacturing Model A is a battery of automatic cadmium plating tanks served by a combined automatic mechanism and conveyor. Virtually continuous, this new apparatus eliminates to a large extent the human uncertainties and incidentally the messiness of this operation.

*Mechanical engineer, New York.

metal parts were laboriously hung on hooks or racks and immersed singly or in groups in the various washing and plating solutions. At the end of the proper time (and that time was apt to vary according to the trustworthiness of the workman) the parts were again laboriously removed, one by one, carried dripping to the next tank, immersed again, pulled out and finally hung on a dripping rack where they remained until they were ready for transfer to the stockroom or to the buffing department. Many times there were not enough parts in any one batch to make it worth while for the foreman to rig up a wooden draining, plating or washing frame. Bent wires and wooden racks, wooden crossbars and grimy tanks combined with a crude switchboard in an entangling maze of wires—such was the old equipment. It was also necessary to truck parts from the machine shop to the polishing, plating and buffing rooms.

How different the modern automatic plating department! True, there still remain some of the old earmarks, but the job is no longer a messy one. No more need it be segregated. No more need the floors be running sewers, the workmen slushing around in rubber boots. Automatic plating tanks and mechanism may be put in or near the process line without greatly interfering with the work going on around it. Like heat treating, it may become part of a straight line of production.

Cadmium Plating Requires Four Tanks

The equipment shown has recently been installed in the Fordson plant for cadmium plating Model A brake shoes. It includes four main tanks: 1, the electric cleaning solution; 2, the first water rinse; 3, the cadmium electroplating tank proper; and 4, the hot water cleaning or rinsing tank.

The parts in groups of ten are hung on the suspension frames, which frames in turn are placed on conveyor hangers in pairs. Loading and unloading is done when the hangers are down between the tanks in the left foreground. Passage through the process is thereafter continuous and automatic. To get from the loading position and from tank to tank, a slowly revolving telescopic arm, whose end is guided around a rectangular path, picks the hanger off the supporting conveyor fingers, lifts it straight up, carries it forward in this elevated position, and then lowers it down again on the forward-moving conveyor, whereupon the work is submerged in the next solution.

This unique mechanical device eliminates the necessity for manual handling and makes the dipping a purely mechanical movement, performed in tempo and at a definite speed so that each operation is given just the right amount of time for its adequate performance. The first tank, shown in the left foreground, in which the parts remain suspended 2½ min., contains a cleaning solution of tri-phosphate of sodium, soda ash, caustic soda and a little sodium cyanide.

Electric Bus Bars Overhead

When submerged in this bath an electric potential is impressed on the metal parts to facilitate the chemical action. A bus bar will be observed just below the conveyor. Each hanger has a contact brush connected with spring clips, to make good contact with the bus bar during this portion of its travel. Naturally the hangers are attached to the casting at top by insulated bolts, so the passage of current will be from overhead bus, through hangers to work, and thence from work to contacts submerged in the tank.

While the brake shoes are in the cleaning tank the conveyor passes around the end wheel and travels from left to right at the rear. Reaching the second tank (not clearly shown at the rear) the hangers are lifted up automatically over the partition and down again into a wash solution.

This second tank contains circulating water and the rinsing operation requires 1½ min. The third tank, in which the parts remain suspended 21 min., is the main electroplating bath. It is a wide long tank in which the brake shoes remain submerged during the most of the trip from left to right (at the rear) and return. During this time the

brushes on the hangers are in contact with a bus bar, impressing the required potential on the submerged parts. The solution used for cadmium plating is composed of cadmium oxide, sodium cyanide, caustic soda and corn syrup.

The fourth and last tank is a hot water rinse, requiring 1½ min. The whole process consumes a total of 25 min.

This plating machine has a capacity of 3080 pieces an hour. Three men are required to operate it and it is estimated that by its use the labor of fifteen men per day is saved. Direct current at 6 volts is used, 20 amp. per sq. ft. of plating surface being required. A 5000-amp. generator set is located in an adjoining room.

Small Parts Handled in Tumbling Barrel

For very small parts which cannot be readily handled on racks a different method is employed. They are loaded into perforated copper buckets; given an "in and out" in a cleaning solution; immersed in hydrochloric acid for two minutes and then emptied into a revolving wooden barrel which, by means of an overhead trolley, is brought over the plating bath, immersed, and revolved for 20 min. in the plating solution. Finally the parts are emptied into a centrifugal dryer, the cadmium solution washed off and live steam is turned on for a 1 min. drying operation, after which they are dumped into containers for conveyance to the stockroom. The cathode placed inside of the barrel comes in contact with the work to be plated as it revolves. The tumbling barrels are made of wood, pierced with ¾-in. holes which allow the flow of the electric current and chemical solution from the anodes outside to the cathodic parts inside. This method is used for plating nuts, bolts and other small articles. It is estimated that this method costs hardly one-tenth of the old method in labor and materials.

In the photograph the centrifugal dryer is shown in the left foreground, while in the middle background a workman is seen preparing to immerse the revolving drum containing the parts into the plating solution. These operations, of course, are not continuous nor fully automatic, but are an adaptation which efficiently plates small parts.

Activities of American Engineering Standards Committee

According to the 1928 Year Book of the American Engineering Standards Committee, it costs \$41,500 in salaries and \$20,000 in expenses to conduct the committee's activities. This amount is raised from dues of 29 member organizations and contributions from 340 sustaining memberships. These figures represent a slight growth from the report for 1927.

Work is in progress on 164 projects, of which 54 were instituted during the fiscal year. Some 29 new standards were finally approved in the 12 months, bringing the grand total of American engineering standards to 111. Among those approved last year are a table of preferred numbers (a scientific basis of sizes for series of machines), standards for pipe flanges and fittings, for bolts and rivets, and safety codes for prevention of dust explosions.

Certain changes have been made in the procedure of committees, designed to expedite the work and to secure assent of all the groups concerned in the project under consideration. A change in name is also under contemplation, as noted in *THE IRON AGE* for July 12, page 84.

Laboratory investigation on the creep of metals at high temperature done during the year past in England at the National Physical Laboratory indicates that an increased chromium percentage (40 instead of 20) proved an advantage for high temperature use; at 800 deg. C. failure occurred mainly by cracking. Of the Ni:Cr:Fe alloys the proportions 25:25:50 have so far given the best results under prolonged loading at 800 deg.

Wide Ramifications of Shipbuilding

Calls for Materials Made on Nearly All Industries
—Benefits to Come with American
Merchant Marine

WITH practically every industry in the United States in line to be benefited, building up of a privately owned first-class American merchant marine comes nearer realization under the recently enacted Jones-White law than at any previous time during the present generation. Already negotiations looking to loans to private operators are being considered, while contracts have been completed for carrying the United States mails.

That the new law means much to American industry is accepted by the highest authorities, who are deeply interested in the restoration of an adequate merchant fleet within the keeping of the requirements of the nation, for carrying on its immense export and import trade. Indicative of this fact are the views expressed to THE IRON AGE by H. G. Smith, vice-president Bethlehem Shipbuilding Corporation, Ltd., and also vice-president and treasurer of the National Council of American Shipbuilders. Mr. Smith was one of the prominent witnesses who appeared before the House Committee on Merchant Marine and Fisheries at Washington in connection with hearings on the Jones-White measure.

"The Jones-White merchant marine act is the most constructive piece of merchant marine legislation that has been enacted within my recollection," Mr. Smith told THE IRON AGE. "While the act may not accomplish every-

thing necessary to establish a permanent American-owned, American-built merchant marine in the foreign trade, under private ownership, it is nevertheless a very important step in that direction.

Act to Save Shipyards from Stagnation

"In the first place, the act reasserts a policy backed up by a large majority vote in both houses of Congress, and further supported by a provision for long-term mail contracts for speeds of 10 knots and upward. The provision, together with a liberalization of loans, both as to the amount of the loan and the rate of interest, will make it possible for the private steamship owner to adopt a constructive program for operation, and to provide for the building of new tonnage. That some vessels will be built this year as the outcome of this merchant marine act seems assured, and this assurance is necessary to save the private shipbuilding industry of the United States, which is now at its lowest ebb within the history of modern steel ship construction.

"The Jones-White act is a notification to the world that we propose to carry a reasonable proportion of our world trade in our own vessels, built in American shipyards."

To show the stimulus which American industry will receive from shipbuilding, Mr. Smith cited the break-

down cost of a 10,000-ton freight steamer as follows:

	Per Cent
Material	50.20
Labor	39.94
Insurance fees, taxes and depreciation	5.36
Freight	4.50

The percentages will be about the same for a motor vessel if the Diesel motors are constructed at the shipyard.

The foregoing percentages show that, for every \$1,000,000 spent in the building of a new vessel, \$502,000 is for materials—ordered from practically every industry in the United States. Analysis of the material distribution of a vessel built at one of the large shipyards shows that practically every State in the Union participates in the material required. Mr. Smith said that the rolled iron and steel in a ship is probably not more than 20 per cent of the total material cost. But, even on such a basis, the iron and steel in a \$1,000,000 ship would reach a value of \$104,000, and, with only a fair activity in shipbuilding, such sums when aggregated would reach substantial proportions. They certainly would mean much to heavy rolled lines, including plates, shapes and bars, as well as other products, and be an important influence in the market.

Other materials would consist of copper, tin, zinc, lead, lumber and allied products; textiles and their products, rubber products, leather,

COMPARATIVE Wage Rates in Three Countries, Showing the Handicap under Which American Shipbuilding Labors in Competition with European Ships Built at Lower Costs. It may be noted particularly that the American laborers are more highly paid than the skilled labor of Great Britain and Germany

electrical products, stone, clay and glass products, all of the elements entering into auxiliary machinery, running through the entire gamut of material down to miscellaneous hardware and food supplies. The machinery requirements would be appreciable, stimulating the machinery trade, as well as iron and steel requirements for their manufacture, and, in turn, lines entirely out of the iron and steel and machinery trade would require this class of equipment in supplying shipbuilding and ship-operating needs.

"The provisions of the bill," said Mr. Smith, "are such that new construction seems certain. This construction will be carried out in American shipyards, and over one-half of the stimulus given to every ship built is a stimulus to nearly every branch of American industry."

How Cost of Large Liner Would Be Distributed

Mr. Smith cited an assumed cost of \$15,000,000 for a passenger vessel of a type necessary to supplement the Leviathan, George Washington, and other leading vessels of the United States lines. Only about 39 per cent of the total cost of building such a vessel, it was explained, will be expended within a shipyard; 5.6 per cent for taxes, insurance and depreciation; 4.6 per cent for freight, and the remainder, 50.8 per cent, for material ordered by the shipbuilder from supply people throughout the country.

Taking the manufacture of steel as an example of this distribution, it

was explained that the shipbuilder pays for this steel as a finished material. The steel maker and supplier of raw materials, however, in producing this steel pay about three-quarters of its total cost to labor. Involved in the manufacture of steel is the purchase of ore, limestone, coke, scrap and miscellaneous materials purchased from various parts of the country, and each of these raw materials involves the purchase of other materials and employment of labor.

Also, said Mr. Smith, in the manufacture of any one of the products in any State, a further breakdown into labor and material will occur, with still further requisitions on other States for raw materials used in the manufacture of such product. The transportation of each of these products to the shipyard requires the services of railroads. Ten per cent of the total cost of construction of a vessel goes to the railroads to pay the transportation charges on materials ordered directly by the shipyard or equipment manufactured by independent contractors. Hence, transportation charges of approximately \$1,500,000 would be paid to the railroads in the construction of a vessel of the value of \$15,000,000.

Labor Gets Seven-Ninths of Total Cost

Of the total cost of \$15,000,000 for such a vessel, it was explained, the shipbuilder expends 39 per cent for labor in the shipyard, and the steel-maker and the suppliers of raw materials used in making steel about 79 per cent of the total cost of steel for

labor. Railroads expend about 41 per cent of the total amount of the freight bill for labor, and every other item of material involves the payment of a correspondingly large percentage of its cost for labor. An exclusive material charge does not exist, except for the intrinsic value of the ore in the mines, lumber in the forest, products of the field and profits to manufacturers.

"The net result," Mr. Smith said, "is that of the total cost of this \$15,000,000 ship, about 78 per cent goes to American labor, composed of almost every known craft, involving a total labor cost of about \$11,700,000, or 2,340,000 days work, or the employment of 7800 workmen at \$5 a day for one year, or 2600 workmen for three years, which is approximately the time required to build this vessel."

Materials Needed to Build a Freighter

The value of material required for a 10,000-ton steam cargo ship and purchased direct by the shipyard was placed at \$736,500, while the freight charges were fixed at \$70,000. Among the items listed and their values were the following: Rolled steel and rivets, \$201,500; sheet steel, \$1,820; sheet brass, \$440; sheet lead, \$200; cast steel, \$23,200; cast iron, \$38,700; cast brass, \$37,400; forgings, \$36,100; steel and iron pipe, \$6,550; brass and copper wire, \$15,800; lead pipe, \$800; valves, \$8,460; pipe fittings, \$4,850; hardware, \$2,200; wire rope, \$5,100; wire and conduit, \$4,100; galvanizing (zinc), \$13,000; generators, \$14,600; boilers, \$113,300; engine room auxiliaries, \$60,130; deck machinery, \$92,000.

Blast Furnace Capacity Declined in 1927

Loss of 3.4 Per Cent Brought Total to 49,605,720 Gross Tons—588,900 Tons Added This Year

TOTAL annual capacity of blast furnaces in the United States producing coke pig iron decreased 1,773,680 gross tons, or 3.4 per cent during 1927, according to the annual statistical report of the American Iron and Steel Institute. Total theoretical capacity, as of Dec. 31, 1927, stood at 49,605,720 gross tons, but three furnaces then under construction have since been completed, making the total as of Aug. 1, 1928, 50,194,620 gross tons. This figure does not include the capacity of 54 coke furnaces "which have long been idle or are likely to remain long inactive," and is based on the possible output of 300 furnaces. This is an average of 165,352 tons annually and indicates an average daily capacity per furnace of 453 tons.

Greatest losses of capacity were evidenced in Pennsylvania, Ohio and Virginia, the figures having been 1,254,100, 430,600 and 374,000 gross tons respectively. New Jersey and Missouri are each shown with no capacity in the 1927 analysis, but had 300,000 and 90,000 gross tons respec-

tively in the previous year. Large gains were shown in Indiana, Alabama and West Virginia, the figures being

291,200, 278,670 and 175,000 tons, respectively. Since the first of the year two new furnaces have been added in Alabama, bringing additional capacity there of 413,900 tons.

Detailed figures are shown in the accompanying table taken from the Institute's reports for the last two years.

ANNUAL CAPACITY OF COMPLETED AND BUILDING BLAST FURNACES BY STATES ON DEC. 31

	(Does Not Include Charcoal Furnaces)		Annual Capacity		Net Change, Tons
	Number of Furnaces	1926	1927	(Gross Tons)	
Massachusetts	1	1	175,000	140,000	+ 35,000
New York	25	26	3,595,800	3,781,000	+ 185,200
New Jersey	2	3	300,000	300,000	— 300,000
Pennsylvania	115	123	16,728,050	17,982,150	+ 1,254,100
Maryland	6	6	1,112,400	1,020,000	+ 92,400
Virginia	15	17	142,000	516,000	+ 374,000
West Virginia	5	5	760,000	585,000	+ 175,000
Kentucky	5	4	240,000	236,000	+ 4,000
Tennessee	10	11	180,000	314,000	+ 134,000
Alabama	33	33	3,577,170	3,298,500	+ 278,670
Ohio	69	69	11,299,000	11,729,600	+ 430,600
Indiana	18	18	4,399,200	4,108,000	+ 291,200
Illinois	26	26	5,171,600	5,048,650	+ 122,950
Michigan	4	4	665,000	665,000	—
Wisconsin	5	5	386,000	386,000	—
Minnesota	3	3	444,500	444,500	—
Missouri	2	2	90,000	90,000	— 90,000
Colorado	5	5	600,000	600,000	—
Utah	1	1	130,000	135,000	+ 5,000
Total completed	(b) 351	(c) 363	(d) 49,605,720	(d) 51,379,400	+ 1,773,680
Total building	3	2	588,900	302,750	+ 286,150
Grand total	354	365	50,194,620	51,682,150	+ 1,487,530

(b) Includes 54 coke furnaces which have been long idle or are likely to remain long inactive, the capacity of which is not included, as follows: New Jersey, 2; Pennsylvania, 15; Virginia, 11; Kentucky, 2; Tennessee, 6; Alabama, 5; Texas, 1; Ohio, 8; Wisconsin, 2, and Missouri, 2.

(c) Included 29 furnaces long idle, the capacity of which is not included, as follows: New Jersey, 1; Pennsylvania, 5; Virginia, 5; West Virginia, 2; Kentucky, 2; Tennessee, 4; Alabama, 3; Texas, 1; Ohio, 3; Wisconsin, 2, and Missouri, 1.

(d) Does not include annual capacity for ferromanganese, spiegeleisen, ferrosilicon and other ferroalloys, nor capacity of coke furnaces long idle or not likely to resume operations in near future.

Mileage Rates May Apply to Steel

Report to Interstate Commerce Commission Recommends
Revision Based on J. & L. Scale—Some Reductions,
but New England Rates Would Be Higher

WASHINGTON, Aug. 7.—A new set of railroad freight rates on iron and steel for the northeastern part of the country has been recommended for adoption by the Interstate Commerce Commission by Howard C. Faul and C. M. Bardwell, examiners on the staff of that body. They recommend it for "the removal of undue prejudice and undue preference."

If their recommendation is approved by the Interstate Commerce Commission, rates will be made in accordance with mileage scale that will force the steel industry to adapt itself to many new conditions.

Assuming that the rates from Pittsburgh to Chicago, from Chicago to St. Louis, from Pittsburgh to New York and from Chicago to New York are of prime importance, the effect of their recommendation is shown in the following summary:

The present rate of 34c. per 100 lb. from Pittsburgh to Chicago will remain unchanged. The present rate of 22c. from Chicago to St. Louis will be raised to 26c. The present rate of 34c. from Pittsburgh to New York will be reduced to 33c. and the rate from Chicago to New York will be cut from 56.5 to 47c.

Ohio Short-Haul Rates in Discard

These recommendations are the result of a lumping together of seventeen formal docket complaints and investigation docket cases created largely by the commission's decision in 1925 in the Jones & Laughlin complaint. One complaint was made against the so-called short-haul rates in Ohio, maintained by authority of Ohio law, to move steel from one plant to another in the steel producing territory. Adoption of the Faul and Bardwell recommendations would put the Ohio rates into the discard.

Parties interested were notified, when the report was served on them, that they would have until Sept. 15 to file exceptions to the recommendations and that replies to the exceptions would have to be in hand not later than Oct. 1. Those dates are taken by those familiar with the practices of the rate body as indicating arguments on the subject late in October or early in November.

This report was made in a general investigation under the Hoch-Smith resolution, the legislation enacted in January, 1925, in which Congress told the rate body to give a preference in freight rates to agri-

cultural products on account of the "existing depression." The commission gathered the objections to the J. & L. scale into one bunch and called the combination a Hoch-Smith resolution investigation. There are nearly a dozen of such investigations, each intended to give the regulating body such a view of rates that it may pick out the commodities upon which higher rates may be imposed to the end that rates on agricultural products may be lowered.

All the testimony and the arguments revolved around the J. & L. scale. The examiners reported that, as a whole, the steel industry was prosperous, or at least not in a depression.

There is no estimate as to the money effect the adoption of the mileage scale would have upon the railroads. Men who have been working on the case estimate that rates made in accordance with the new scale would deprive the railroads of about \$2,000,000. That would be a small sum in relation to the immense revenue the railroads derive from iron and steel in the northeastern part of the country.

Only domestic rates are covered by the report. The railroads took the export rates out of the case when they reduced the export rates to Atlantic ports to the basis of 60 per cent of the domestic basis.

The examiners recommend the abolition of differentials, port and Michigan, and of bridge arbitraries. Abolition of the port differentials, they figure, will mean little as the export rates are not involved. Port differentials were devised so as to equalize exports regardless of which port the exporter used.

Michigan differentials were devised about 10 years ago when class rates were revised in that part of the country between the Buffalo-Pittsburgh line on the east and the Mississippi River on the west, on account of the light traffic in Michigan north of Detroit. Steel took the differential adjustment because it moved and still moves generally on fifth class rates.

This scale is a specific scale not definitely related to any class rate. Therefore the examiners say there is no need to take care of light density traffic areas.

Higher Rates for New England

New England is to be the only part of the northeastern section that is to have rates on a higher level. Rates

into New England are to be 10 per cent higher than the rest of the section involved. Rates into and out of New England are to be on the scale. That will mean a healthy boost in rates now held down by the so-called wire list.

Another rise in rates is to take place in the low-rated section of western steel territory, particularly the district between Chicago and St. Louis. The group adjustment which shippers and railroads agreed upon to settle the turmoil created by the J. & L. scale is to be broken up and straight mileage applied. Under the J. & L. scale the railroads could have made the rate between Chicago and St. Louis 24.5c. The violent objections by the shippers forced the railroads to forego what they were privileged to take. Now the examiners say the railroads should be authorized to take more than the J. & L. scale would have given them.

Shippers Asked for Reductions

The railroads opposed any reduction in their revenues. All the shippers asked for reductions. Some of their proposals, if adopted, would cut heavily into the revenues of the railroads.

The Faul and Bardwell scale uses the J. & L. scale initial rate as its point of departure, but beyond the first block and up to and including 70 miles it is half a cent lower than the J. & L. scale. Between 70 miles and 500 miles it is in excess of that scale, the excess ranging from a half to a whole cent per 100 lb. For distances in excess of 500 miles, the new scale is lower than the one ordered in the J. & L. case. At 600 miles, the new scale calls for a rate of 38c., while the J. & L. rate for that distance is 40c. At 700 miles, the new scale rate is 41c. and the J. & L. rate 45c. At 1000 miles, the new rate is 50c. and the J. & L. rate 60c.

Only a limited amount of grouping of rates at points of origin and destination will be permitted. No origin points may be grouped on traffic going less than 150 miles. No destination groups will be allowed on traffic going less than 450 miles. Groups 20 miles wide may be established in accordance with the practice in making class rates in the central territory. The scale itself also permits limited grouping.

The abolition of bridge differentials at Ohio and Mississippi crossings will mean little because there are no out-

standing differentials on iron and steel except at Louisville. There are differentials on some iron and steel articles at St. Louis.

No attempt is made in the report to deal with the New York harbor situation. That situation is to be dealt with in the Eastern Class Rate Investigation, now pending.

Special Provision for Cast Iron Pipe

The iron and steel list is left as it stands although special provision is proposed for cast iron pipe and annealing pots. On account of the strong competition of Southern pipe foundries, the examiners say that where rates in the North and East have been made especially on account of that competition they are to be continued. As to annealing pots, they say the rates on them should not be any higher than on ingot molds. They said that nothing in the record warranted any change in the minimum carload of 36,000 lb. The actual loading, they said, averaged nearly double that figure. An increase in the minimum they said would seriously affect the jobber and small fabricator without increasing efficiency in the use of railroad equipment.

Faul and Bardwell said the record left no doubt about the desirability of a thorough revision of the rate structure. They said both shippers and railroads alleged or conceded that the present rates lacked uniformity, were

full of inconsistencies and resulted in prejudice and preference.

No transportation conditions between New England on the east and the Mississippi River on the west, they said, warranted a difference in the rate level. They said that every proposal submitted, although they differed widely as to the rate level, was designed to remove inconsistencies and to produce a more harmonious rate structure.

The mileage scale recommended by the examiners is as follows:

(Rates are in cents per 100 lb.)		
5 miles and under		6
10 miles and over	5.....	6.5
15 miles and over	10.....	7
20 miles and over	15.....	7.5

Toolroom Problem of Small Plants

Plan to Eliminate It by Means of a Cooperative Venture Participated in by Those Needing Tooling Service

BY BRUNO C. LECHLER AND EDWARD W. WEILER*

A MANUFACTURER of metal goods, in order to make his product economically, must provide himself with tools specially designed and specially built for his particular product. Of course he uses such standard tools as hammers, screw drivers, etc., and such standard tools as punch presses, lathes, drill presses, etc., but the efficiency of special tools that he must design for holding while working, for aiding in assembly for locating holes, etc., on his particular product are the factors in determining his ability to turn out his product quickly and cheaply and which enable him to defy competition.

Large manufacturing concerns who are continually making new products can afford to have their own toolrooms and tool designers; the smaller manufacturer usually depends on the outside jobbing toolshop, although not always with satisfaction.

Tool making is a highly specialized art and for this reason the smaller manufacturer cannot make his own

tools to the best advantage. An efficient toolmaker is an expensive man; he cannot be picked at random from the street; he is not in the same class with the ordinary production hand. Not all men who call themselves toolmakers are efficient at their trade. Quite often a toolmaker earning 80 to 90 cents an hour can spoil a piece worth \$50 or \$60 before it can be discovered that he is an inferior worker. Furthermore, not only is a badly needed piece spoiled, but a week's valuable time may be lost.

Toolroom equipment is expensive to buy. It must be of a much higher quality than ordinary production machinery. It must be capable of high accuracy. It must be handled with extreme care by some one familiar with it. Unless an expert toolmaker is put to work on it, it will soon lose the efficiency needed for producing good dies and tools. If this machinery is not used constantly it represents a large idle investment. Therefore the smaller manufacturer who only needs new tools occasionally, cannot economically afford to keep it. It is

sounder business for him to patronize the jobbing tool shop.

We may say, therefore, that it is very expensive for the smaller manufacturer to make his own tools for the following reasons:

- 1—Because of limited capital his toolroom equipment must necessarily be limited in scope.
- 2—As this equipment is idle a majority of the time, it becomes an unproductive investment, taking up needed space, requiring maintenance and being of use only a small part of the year.
- 3—The toolmakers hired will probably be for the most part inefficient. Even granting, however, that the tool gang is efficient, it will lack expert supervision.
- 4—A good tool engineer, needed to supervise a tool gang, cannot be picked up at short notice for a few weeks' period; he must be trained to the job.

In spite of all these objections many smaller manufacturers do maintain their own toolroom at a considerable loss, because they are of the opinion that they cannot get fair prices or fast enough delivery from the jobbing toolshop when they are in the market for their tools. With such manufacturers it is generally a case of requiring a large number of tools in a great hurry, and they hesitate to place themselves at the mercy of an outside agency. Since the jobbing tool shop has quite a number of customers who do not give it a constant flow of work, it must cater to the

*Tool Engineers, Eureka Tool & Machine Co., 42 Walnut Street, Newark, N. J.

average, and should the toolshop be overburdened at any particular time, it can only in fairness to all its customers divide its facilities as evenly as possible among its customers.

The result is dissatisfaction all around. For this reason the manufacturer often prefers to play safe and have his own equipment so he can have his set of dies and tools when he needs them.

Quite often, too, tooling up a new product requires considerable experimentation and adjustment, which precludes the possibility of agreeing on a contract price before the tooling up is begun. This often leads to arguments and misunderstandings, and the manufacturer feels that he is getting off cheaper in the end by having his own toolshop.

To eliminate these various causes for hesitancy on the part of the smaller manufacturer to giving his work out to the jobbing shop, and at the same time attempting to relieve him of the burden of an unproductive investment, the authors of this article propose the organization of a manufacturers' cooperative toolshop to serve those manufacturers who become members, to their mutual benefit.

The cooperative tool company centrally located and jointly operated takes care of all the enumerated difficulties in this way:

- 1—The cooperative shop is large enough to get all the necessary equipment consisting of substantial and efficient machinery. Single pieces of equipment might cost as high as \$10,000, while the average small manufacturer would not care to invest more than \$5,000 in his whole toolroom.
- 2—The cooperative shop is big enough to maintain a proper organization; with a tool engineer, draftsman, a well trained tool gang specialized on dies, jigs, fixtures, etc., some for heavy work, such as automobile fenders, and others for light work, such as hair springs on galvanometers, etc. In the manufacturer's own toolroom the man accustomed to repair a 2-ton press is often expected to make a tool accurate to 0.0001 in., which is anything but efficient.
- 3—It is not likely that more than one manufacturer will be using the facilities of the shop to a large extent at one time, so that any member could probably have three-fourths of the shop's equipment and personnel available for its use whenever needed, yet at the same time the shop need not neglect its other manufacturer members. In this way work is more nearly uniform, men have steadier employment, overhead is reduced, and the cost of doing work is lowered.
- 4—Under the proposed scheme each manufacturer member is to be a stockholder. He has access to the records, and shares in the profits; he has a say in the management. His tools will be built at the lowest possible cost; any profits will come back to him in dividends.
- 5—In order to prevent leakage of confidential methods of manufacture, etc., manufacturer members could be limited to one in each field of manufacture.

The Cooperative Tool Co. could be capitalized, say for \$100,000; \$50,000 to be paid in at the start, and the rest

of the stock to be held in the treasury.

The management of the shop would be under the direction of an experienced tool engineer. He would have as an assistant a draftsman and shop foreman, the duties of which offices could be performed either by one or two men, as the contingencies of the moment might demand. These men would be under a salary and at the same time would hold some of the common stock so as to work on a profit sharing basis. The direct management would be by a board of directors, elected by participating member stockholders and comprising, as far as feasible, one representative from each manufacturer member and also the manager of the shop.

Work would be done for each manufacturer member as it was needed on open order, the work to be billed at an hourly rate, plus material at cost. The hourly rate would be set so as to be on a par with that charged by regular jobbing tool shops. This would, of course, take into consideration, overhead, etc., and would be what the manufacturer would have to pay were he having his work done by an outside toolshop.

Whenever there was not enough work in the cooperative shop from participating members, outside jobbing work could be solicited, in order to keep the shop busy. However, the requirements of participating members would at all times receive preference.

The shop would be so organized that it would be possible to provide any participating member with the services of a repair toolmaker at an instant's notice. He could have three men put on work for him within a day's notice and six men within three days' notice. This would more than take care of any immediate rush jobs.

The tool engineer would divide his time between supervising the shop and designing dies or tools for participating members.

It is felt that with the plant as designed by us, a minimum of \$150,000 worth of tool work could be undertaken in a year. Because of the fact that a good many of the reoccurring idle periods so prevalent in a jobbing shop could be eliminated, the overall efficiency could be increased, and because the overhead could be reduced to a minimum, the profits of the cooperative toolshop would be exceedingly high, probably amounting to as much as \$30,000 for the first year, based on a \$150,000 gross business. This could be applied against dividends and would show a handsome return to each participating member against his investment. This should make the proposition exceedingly attractive to the smaller manufacturer who not alone could cut his original toolroom investment to as much as one-tenth of what his own toolroom would cost him, but could at the same time secure superior service and quality, and be relieved of all worry in connection with his toolwork.

The participating members would thus relieve themselves of the responsibility of maintaining a toolroom, which is of necessity separated from their production routine and is always a source of constant attention.

This plan for alleviating the toolroom difficulties of the small manufacturer should appeal to all farsighted managers of those manufacturing concerns who have not their own toolrooms, and who are dissatisfied with conditions as they find them at the present time in outside jobbing shops. It is planned to soon put this plan into actual operation in the Metropolitan New York district.

Coming Meetings

August

Ohio State Foundrymen's Association. Aug. 16 and 17. Annual convention, Cedar Point, Ohio. Arthur J. Tuscany, secretary-manager.

American Society of Mechanical Engineers. Aug. 27 to 30. Summer meeting starting with Great Lakes cruise at Buffalo, Aug. 20, followed by sessions at St. Paul and Minneapolis. Calvin W. Rice, 29 West Thirty-ninth Street, New York, secretary.

National Council of Y. M. C. A. Aug. 29 to Sept. 2. Conference on human relations in industry, Silver Bay, Lake George, N. Y. Arthur H. Young, 165 Broadway, New York, chairman committee in charge of Silver Bay conference.

September

Canadian National Exhibition. Sept. 4 to 7. Second steel and power show, University of Toronto Arena, Toronto, Canada. C. Bradshaw, 24 Front Street, West, Toronto, executive director.

Institute of Metals. Sept. 4 to 7. Fall meeting, Liverpool, England. G.

Shaw Scott, 36 Victoria Street, London, S. W. 1, England, secretary.

Lake Superior Mining Institute. Sept. 7 and 8. Joint meeting with iron and steel division of the American Institute of Mining and Metallurgical Engineers, Crystal Inn, Crystal Falls, Mich., starting place. A. J. Yungbluth, Ishpeming, Mich., secretary.

American Manganese Producers' Association. Sept. 10 and 11. Annual meeting, Mayflower Hotel, Washington. J. Carson Adkerson, Metropolitan Bank Building, Washington, president.

American Society of Mechanical Engineers. Sept. 17 to 20. Second national fuels meeting, Hotel Cleveland, Cleveland. Calvin W. Rice, 29 West Thirty-ninth Street, New York, secretary.

American Electrochemical Society. Sept. 20 to 22. Fall meeting, Hotel Kanawha, Charleston, W. Va. Colin G. Fink, Columbia University, New York, secretary.

American Society of Mechanical Engineers. Sept. 24 to 27. Machine shop practice meeting, Cincinnati. L. C. Morrow, 29 West Thirty-ninth Street, New York, chairman of division.

Lathe With Boring Bar Attachment for Cylinders

A 36-in. by 22-ft. lathe with boring bar attachment for turning, boring and recessing large bushings for three-cylinder locomotive cylinders, furnished recently by the Niles Tool Works Co. division of the Niles-Bement-Pond Co., 111 Broadway, New York, for a foreign locomotive builder, is shown in the accompanying illustration.

With the Boring Bar Attachment Large Bushings for Locomotive Cylinders of Foreign Manufacture Are Turned, Bored and Recessed

tration. In the United States the general practice would be to perform these operations on a vertical boring and turning mill, but the design of the bushings and certain other factors have made it desirable to employ an engine lathe for the work.

The machine is the Niles standard Time Saver lathe with the addition of a boring bar bracket bolted across the wings of the carriage supporting a heavy boring bar. The boring bar has

an outer support and a pilot bar carried in a bushing on the spindle nose. The end of bar is fitted with a key to which a boring head is secured. A large center rest is also furnished.

The bushings are about 40 in. long, with an outside diameter of 27½ in. and a bore of 25½ in. They are cast with a flange for chucking on a faceplate. After chucking a light cut is taken on the outside diameter to provide a bearing for the large center

rest. The casting is then ready for the boring operation. After boring is completed, the bushing is mounted on an arbor between centers and the excess length of bushing and flange cut off, the outside diameter turned, both ends faced and recesses machined in both ends. The process requires two operations, but it is claimed that the results secured more than offset the extra time consumed.

Slitter and Coiler Combined to Permit Two Operations

USE of auxiliary equipment to permit the accomplishment of two operations at a single handling of material is illustrated in the slitter and coiler here pictured, which have been built by the Torrington Mfg. Co., Torrington, Conn. Although designed primarily for operation as a single unit, either of the two machines may be used separately if desired.

The slitting machine is of the three-housing type, in which the outer hous-

ing is withdrawn to an extension of the bed pedestal in changing cutter blades and spacing collars. Arbors are 6¼ in. in diameter, taking slitter blades 12 in. in diameter, 1 in. thick. The slitter has a capacity for cutting metal ¼ in. thick up to 42-in. trimmed width. An unusually rugged drive is provided through 50-hp. motor, with speed reduction through herringbone gears inclosed in an oil-tight case. Cutter arbor pinions, also of herringbone type, are located between the pinion housings and are entirely inclosed in grease-tight case. Cylind-

drical couplings connect the motor to the pinions and the pinions to the slitting machine. Adjustment of the top arbor is in parallel by means of a handwheel which operates lifting screws through worm gears. Provision is also made for lateral adjustment of the top arbor in relation to the bottom.

The coiler is of the usual three-roll type equipped with pinch or feed rolls. It permits the immediate removal of the coil without the necessity of stripping it from a block. An important feature of the coiler is the air-operated coil ejector, which is necessary because of the heavy coil made by the machine. Drive of coiler is by 25-hp. motor through pinions inclosed in an oil-tight case, and thence by spindles and couplings to the feed and coiling rolls.

New Belt Conveyor Idler

A NEW idler for belt conveyors has been placed on the market by the Fairfield Engineering Co., Marion, Ohio. Centrifugal cast iron pipe is used for constructing the roller, and anti-friction bearings and direct high-pressure lubrication are included. Owing to the uniform wall thickness of the pipe and its trueness to shape, it is said to run without vibration and the cast iron is depended on to resist rust and abrasion. The grease pipes are extended to the end of the supporting frame, making the connection accessible and eliminating need to reach under moving belts.

Interchangeability of rollers is stressed. Bearing adjustment is said to be positive to any desired degree of fineness. The face of the return roller supports the belt 1½ in. above the bottom flanges of the springer channels, giving good belt clearance above supporting frame cross members.

The General Electric Co. paid \$1,600,905 in supplementary compensation on July 30 to employees in its various plants and offices who have been with the company for five years or more. This sum, the largest ever distributed by the company in this form, represents 5 per cent of the earnings of employees for the six months ending June 30, 1928. The largest amount, \$499,425, was paid to employees of the Schenectady works.

The Coiler, of Three-Roll Type with Feed Rolls, Permits Removal of the Coil without the Necessity of Stripping It from a Block. It has an air-operated coil ejector

The Slitting Machine, with Which the Coiler Is Used in Combination, Has Capacity for Strips Up to 42-In. Trimmed Width, ¼-In. Thick

Improved Piping Features New Broaching Machine

SIMPLIFICATION of the piping from the pump to the cylinder, making for greater compactness, is one of several refinements embodied recently in the high-speed broaching machines manufactured by the Oil-gear Co., Milwaukee. In the previous design the safety and unloading

to the pump itself. Piping beneath the cylinder is thus eliminated and the appearance of the machine greatly improved, as shown in the accompanying illustration of the improved No. 3 broaching machine. Flange and bolted pipe connections are employed.

A control bracket guard, intended to prevent possible injury to the operator's hands, is an added safety feature. Sea ring ram packing has

different pull center lines. This feature is of particular advantage in broaching keyways, when it is necessary to take two draws with a cutter-bar and then raise the center line of the draw-bar for the section cut, in order to obtain the proper depth of keyway.

The improved variable delivery pump, illustrated herewith, is designated as the type MD. Its displace-

Simplification of the Piping From the Pump to the Cylinder Makes For Greater Compactness. The smaller cut shows the improved variable-delivery pump

valves were mounted in the pipe lines, which arrangement required an unnecessary amount of piping and joints. In the improved pump the safety and relief valves have been manifolded on

been adopted as standard on all machines. The crosshead of the machine is now equipped with convenient adjustment for raising and lowering the drawhead slide to accommodate

ment is 17.1 cu. in. per revolution. The normal working pressure is 700 lb. per sq. in. and the peak pressure, 900 lb. per sq. in. Use of a 10 to 15 hp. motor is recommended.

Air-Motor Hoist of 10 Tons Capacity

A NEW air-motor hoist of 20,000-lb. capacity is being offered by Ingersoll-Rand Co., 11 Broadway, New York. In railroad shops this hoist is used for handling locomotive drivers at lathes and presses, and for other heavy lifting work which would ordinarily tie up a crane.

The hoist construction employs a four-cylinder air motor geared to a rope drum, and all inclosed in a compact and dirt-proof housing. The gears are made of special steel and heat treated to insure extra strength and wearing qualities. They operate in a bath of semi-fluid grease, completely inclosed. Ball bearings or bronze bushings are provided at all points where experience has indicated that they will add to the efficiency and life of the hoist.

An automatic safety brake holds the load at any desired position for any length of time, regardless of air pressure. Control of the hoist movement is obtained by a graduated throttle and a well-balanced motor. The latter is practically without vibration. The cylinders are renewable and interchangeable, making it easy and inexpensive to renew them if worn after long service.

This hoist can be furnished with either a top hook or a chain-driven trolley as standard. Its weight,

equipped with top hook, is 1300 lb.; equipped with chain-driven trolley, 1800 lb. The pipe connection is $\frac{3}{4}$ -in.

An Automatic Brake Holds the Load at Any Position Regardless of Air Pressure

The cable is 9/16 in. in diameter and 83 ft. long and the maximum lift is 16 ft.

The Clipper Belt Lacer Co., Grand Rapids, Mich., announces a 10-in. open-end Clipper belt cutter which will cut and square belting up to and including 10 in. in width.

Power House Will Have 215,000 Hp. Turbo- Generator

THE New York Edison Co., in its new East River generating station, at Fourteenth Street, New York, will have the largest single-shaft, single-unit electric generator in the world. This turbo-generator, which will develop 160,000 kw., or 215,000 hp., is being built by the General Electric Co.

The steam generating units, which will be of the new water wall type, are to be installed by the Combustion Engineering Corporation. Each of the units required will have an aggregate heating surface of 45,120 sq. ft. and each is to produce 550,000 lb. of steam an hour, though studies are being continued to obtain a maximum capacity each of 800,000 lb. or more an hour.

Two 48-in. Hartzell-Charavay fans were recently installed in the 8-in. tie mill of the Atlantic Steel Co., Atlanta, Ga. The Charavay fans, which are made by the Hartzell Propeller Co., Piqua, Ohio, have a propeller of the type which has proved successful in airplane construction. The propeller blade is made of a metal alloy and is commonly direct connected to the electric motor for driving it, and the supporting ring and frame of the fan unit are constructed of aluminum for lightness and rust prevention.

European Mills Maintain High Prices

British Expect More Orders With Less Foreign Competition—United States Investigates Imported Steel Markings

(By Cable)

LONDON, ENGLAND, Aug. 7.

THE iron and steel markets are quiet after the holidays and the outlook is unfavorable. Northeast Coast pig iron output has been restricted to 29 blast furnaces and foundry iron prices are being maintained, despite the lack of new demand. There was partial resumption of Scottish production last week and full resumption is expected this week. The holiday was prolonged by depressed conditions, which have provided only a meager accumulation of orders for iron and steel.

Steel makers expect an improve-

ment based on the higher tendency of Continental prices and on Government aid.

New shipbuilding contracts are especially limited. Clyde output in July was 13 vessels of 38,700 tons, including one 10,000-ton cruiser.

Continental markets are strong as a result of sustained overseas demand and mills are well sold ahead. Belgian output in June was 321,000 metric tons of pig iron and 32,000 tons of steel ingots.

Tin plate is quiet and mills are closed for their annual week of suspension. Inquiry, however, is promising. Galvanized sheets are quiet and the black sheet market inactive.

slightly smaller than the average in May, but the average daily output of rolled steel products exceeded the previous month.

Domestic prices of steel products for August have been announced as 111.50 m. (\$26.62) per ton for blooms; 119 m. (\$28.40) per ton for billets; 138 m. (\$32.94) per ton for structural shapes; 141 m. (\$33.66) for steel bars and 164 m. (\$39.15) for steel bands. The usual rebates are quoted on sales to South Germany.

Steel producers here do not seem to expect any result from the initiative of Conservative members of Parliament in England in favoring a safeguarding duty on iron and steel. It is pointed out that this question was repeatedly under consideration prior to the war as part of the movement for tariff reform, but was strongly opposed by British shipbuilders and other manufacturing consumers, who claimed that their ability to compete in world markets was largely based upon their supply of low-priced, duty-free steel from abroad.

At the meeting of the International Steel Cartel last week some important changes were made. The German export quota, which has been limited to 275,000 tons a month in return for a reduction to \$1 a ton in the German penalties for overproduction, was advanced to 300,000 tons a month. In addition, the entire system of fines for exceeding output was revised. The

German Steel Consumers Well Stocked

Improved Buying Expected in Fall—Steel Cartel Revises Fines—Czechoslovakia Joins for Export

BERLIN, GERMANY, July 21.—The Rhenish-Westphalian steel industry continues to report a falling off in orders, but some allowance is made for the usual summer quiet and for the heavy purchases by consumers prior to the May advance in prices. Steel bars are still in good demand and delivery terms extended. Probably the least activity is reported by manufacturers dependent upon orders from the Railroads Corporation. In some quar-

ters greater activity is expected in the next two or three months.

Except for billets, demand for semi-finished material has declined considerably. Building construction is quite active and there is a good demand for structural material. Export business is better, a reflection of the reaction on the Brussels market following termination of the Antwerp dock workers' strike. In June the average daily output of steel ingots was

British and Continental European prices per gross ton, except where otherwise stated, f.o.b. makers' works, with American equivalent figured at \$4.86 per £ as follows:

Durham coke, del'd.	£0 17½s. to £0 17¾s.	\$4.25 to \$4.31

(a) Nominal.

penalty for exceeding the quota by 7.50 per cent or less is reduced from the former \$4 a ton to \$1 a ton; for producing more than 7.50 per cent or less than 10 per cent the fine is \$2 a ton. On all production in excess of 10 per cent of the quota the penalty continues at \$4 a ton. This applies to all members except Germany, regardless of whether the excess is sold at home or for export. For Germany, this ruling applies only to export.

The Central European group of

members in the International Steel Cartel has been dissolved and Austria and Hungary have become direct members of the cartel. Czechoslovakia, however, becomes a member on new terms, which leave production for the domestic market without any allotment, but set an annual export quota of 432,836 metric tons, the actual export of Czechoslovakia in 1927. Should the export quota be exceeded the usual penalties effective with other members are applied.

usually imported in boxes, kegs, or other containers.

"Iron and steel in various forms, such as blooms, billets, bars, beams, angles, or other forms of structural iron or steel, steel rails, fish plates, pig iron and iron or steel in other forms not manufactured into articles are regarded as material and not subject to marking to indicate the country of origin."

It is believed among importers that the present action is being brought about by a domestic steel maker in order that the definition of "material" may be decided and articles which need not be marked with the country of origin will be more completely specified. Any action before the Customs Court would not be taken until fall.

Export Orders Small

Exporters to South American markets and the Far East are fairly well occupied with inquiries for various steel products, but tonnages are in most cases small. A recent inquiry from Japan for about 190 tons of structural material is understood to have gone to a European mill, but about 400 tons of channels for the Imperial Government Railways in Japan was placed with a mill in the United States. There have been some small inquiries for steel bars recently from Japan and the usual export quotation by this country is reported to be about \$45 per ton, c.i.f. Japanese port.

In rails, about 360 tons of 91-lb. high T-rails for a privately owned railroad in the Moji district of Japan were placed with an American maker and 300 tons of 91-lb. high T-rails for the Ugigawa Denki Kido Kaisha were also awarded to a mill in the United States. Not much export business is reported in either light gage sheets or tin plate.

Belgian Market Active and Prices Higher

ANTWERP, BELGIUM, July 20.—A larger volume of business is being placed and prices are increasing slowly. Buyers are offering less resistance to advances and some sizable purchases have been made, especially by German and British buyers. Pig iron is quiet with the domestic price of No. 3 phosphoric foundry grade at 585 fr. (\$16.40) per ton, at the furnace and the export prices about £5 2s. 6d. (\$15.40) per ton, f.o.b. Antwerp.

In semi-finished material there is improved demand and mills seem to be fairly well booked with orders. Prices have advanced and are firm with blooms scarce at £4 5s. 6d. to £4 12s. 6d. (\$20.78 to \$22.48) per ton for 4-in. to 8-in., billets firm at £4 14s. (\$22.84) per ton for 3-in. and £4 15s. (\$23.09) per ton for 2-in. billets. There is an active demand for sheet bars and available supplies are small. The price has advanced to about £4 16s. (\$23.33) per ton, f.o.b. Antwerp.

The higher prices now prevailing are quite firm and mills are well

booked with business. Production of steel bars is limited so that there is only a small supply available with the market at £5 14s. 6d. per metric ton (1.26c. per lb.). Beam prices are strong at about £4 17s. 6d. per ton (1.07c. per lb.), f.o.b. Antwerp. Corrugated steel bars are £5 16s. 6d. per ton (1.28c. per lb.) and hot rolled hoops £6 15s. per ton (1.49c. per lb.), f.o.b. Antwerp. The sheet market is showing a tendency to advance with demand especially good for the heavier gages. Thomas sheets, 1/16-in. in thickness are quoted at about £6 17s. 6d. per ton (1.52c. per lb.), f.o.b. Antwerp.

German Rod Mills Seek Far Eastern Orders

HAMBURG, GERMANY, July 21.—Some disagreement has developed in the German Wire Rod Syndicate as to the proper quotations to be made on business for Japan. For some time prices have been too high to secure orders and most of the Japanese buying has been done in the United States and Canada. No agreement has been reached and further consideration of

Foreign Steel Prices Still High

Importers Here Sell Little—Steel Marked for Country of Origin—Export Orders Small

NEW YORK, Aug. 7.—Importers of steel from European mills continue rather inactive, unable to secure much business at the present level of Continental prices. A further advance in the foreign market has brought quotations on Bessemer steel bars to 1.83c. to 1.85c. per lb., delivered New York, to which must be added the cost of inspection and packing. Beams range from 1.68c. to 1.70c. per lb., duty paid, New York, and channels are about 1.75c. per lb., duty paid. While there has been some inquiry recently for wire nails, not much business has been transacted, as most buyers are evidently interested only in small lots of a few hundred kegs.

Recent notices sent by the United States Treasury Department to importers of steel, informing them that certain shipments of bars and shapes were being investigated because they were not marked as to the country of origin, appear to be the preliminary steps to a test case before the United States Customs Court. A leading American steel company is understood to have requested a complete statement by the Government as to the exact products which should be marked with the name of the country of origin under the tariff act. As a result of this, importers believe that the present investigation was instituted with the intention of selecting some shipment, of which a test case would be made to clarify the question.

Marking of imported material is covered in Section 304 of the Fordney-McCumber tariff. The section reads in part as follows:

Sec. 304. (a) That every article imported into the United States, which is capable of being marked, stamped, branded, or labeled, without injury, at the time of its manufacture or production, shall be marked, stamped, branded, or labeled, in legible English words in a conspicuous place that shall not be covered or obscured by any subsequent attachments or arrangements, so as to indicate the country of origin. Said marking, stamping, branding, or labeling shall be as nearly indelible and permanent as the nature of the article will permit.

This section of the tariff further states that: "Unless the article is exported under customs supervision, there shall be levied, collected, and paid upon every such article which at

the question is expected at the next meeting in August. Meanwhile, merchants have begun offering wire rods for export at Hamburg and other centers at 2s. 6d. to 3s. 6d. (60c. to 85c.) per ton lower price than the official syndicate figure of £6 (\$29.16) per ton for large lots. As there are no makers in Germany at present who are not members of the syndicate and the St. Ingebert works in the Saar has its own export organization, it is believed that these rods offered at less than the market are coming from German mills seeking to prevent total loss of their Far Eastern markets. As wire rods are sold f.o.b. Antwerp, it is difficult to trace the origin of a particular shipment. It seems to be expected that the syndicate will reduce all prices.

German Mill to Roll Aluminum on Steel Sheets

The Eisen und Stahlwerke Hoesch Actiengesellschaft, Dortmund, Germany, according to Trade Commissioner James E. Wallis, Berlin, is reported engaged upon the construction of a new plating plant and rolling mill on its property, Stockheide, in the Ruhr. In this new mill it is planned that aluminum, and later other metals, will be rolled on ordinary black steel sheets by a special, patented process, the invention of an engineer of the Wickeder Iron & Steel Works. It is expected that this new aluminum plate will have a decided effect upon the present tin plate industry. Machinery for this new plant is being made by the Krupp Works.

The development of this new "plate" by the Hoesch company is the more significant when it is recalled that this company, since its amalgamation with the Wolf, Netter & Jacoby Co., Berlin, now produces the largest tonnage of tin plate of any German works engaged in the manufacture of this product.

German Open-Hearth Extra Causes Output Decline

HAMBURG, GERMANY, July 21.—The steel ingot production in the first half of 1928 of 7,914,599 metric tons was only slightly less than the 7,952,370 tons produced in the first half of 1927. Output of Thomas steel, however, increased, and open-hearth steel production showed a corresponding decline. Of the total for the first half of this year, 4,086,741 tons was basic and acid open-hearth grade, which was 291,645 tons less than the total in the same period of last year. At the same time the output of Thomas grade was 3,586,414 tons, which was 237,849 tons more than in the previous year. This shift in output is noteworthy as from 1921 to 1927 open-hearth output has been constantly increasing and Thomas steel production declining.

The decline in open-hearth is explained, at least in part, by the recent

increase in the extra for open-hearth steel from 3 m. to 5 m. (70c. to \$1.20) per metric ton and the further advance in January to 8 m. (\$1.90) per ton. The latest increase brought the cost to a level that was not interesting

to consumers. In consequence of this reduction in demand for open-hearth steel and the recent lower prices of steel scrap, it is believed that mills will reduce the extra to the former level of 5 m. (\$1.20) per ton.

New Extras for Special Analysis Steels

Charges from \$1 to \$5 a Ton to Be Imposed for Carbon, Manganese, Silicon, Sulphur, Phosphorus, Etc.

THE report of a committee of steel manufacturers, of which Charles O. Hadly, vice-president in charge of sales Alan Wood Iron & Steel Co., Philadelphia, was chairman, covering the costs of manufacturing carbon steel billets, published in THE IRON AGE, Oct. 14, 1926, and presented at the fall, 1926, meeting of the American Iron and Steel Institute, is the basis of a new list of extras for chemical composition covering all forms of finished and semi-finished steel. The new extras vary slightly in some respects from the findings of the Hadly committee, but essentially they adhere closely to the facts disclosed by the cost studies of that committee.

The committee, using basic open-hearth steel of 0.10 per cent to and including 0.20 per cent carbon as a base, found the average cost of producing steel of 0.21 per cent to 0.50 per cent carbon was \$1 a ton above base; for steel of 0.51 per cent to 0.75 per cent carbon content, \$2 a ton above base; for 0.76 per cent to 0.95 per cent carbon steel, \$3 a ton, and for 0.96 per cent to 1.40 per cent carbon, \$5 a ton.

The actual list of extras imposes no charge for open-hearth steel running 0.10 per cent to 0.25 per cent carbon, a charge of \$1 a ton for carbon 0.26 per cent to 0.60 per cent, and of \$3 a ton for carbon of 0.61 per cent to 1.25 per cent. No charge is made in Bessemer steel running from 0.08 per cent to 0.25 per cent carbon. For open-hearth steel, when the maximum carbon range specified is 0.09 per cent, there is a charge of \$1 a ton and a like charge on Bessemer steel when the maximum range specified is 0.07 per cent. The Hadly committee found the extra cost of both open-hearth and Bessemer steel in the low carbon range was \$2 a ton.

Manganese Extras Up to \$5 a Ton

For manganese from 0.30 per cent to 0.90 per cent no charge is imposed; in the committee report, using a content of 0.30 per cent to 0.60 per cent as base, it was found there was an extra cost of \$2 a ton for 0.61 to 0.80 per cent manganese open-hearth or Bessemer steel, and of \$4 a ton for manganese content of 0.81 to 1.20 per cent. The card imposes a charge of \$2 a ton for 0.91 to 1.15 per cent manganese, of \$4 a ton for 1.15 to 1.35 per cent and of \$5 a ton for 1.36 to 1.50 per cent, but waives the charge for manganese of more than 1.15 per cent on

steel with a carbon content of under 0.20 per cent.

Silicon content extras also represent some modification of the cost findings of the Hadly committee and that also is true of sulphur content charges. For copper content up to 0.20 per cent minimum, the card calls for an extra of \$2 a ton, against the committee cost finding of \$3. The \$2 per ton charge, however, refers to bars, plates and shapes, and not to other products on which there is an existing extra for copper of \$3 a ton.

The new card follows:

EXTRAS FOR CHEMICAL COMPOSITION

(The mean of the range agreed on between purchaser and manufacturer shall determine the extra.)

For Carbon		
Open-hearth	0.10 to 0.25 }	No extra
Bessemer	0.08 to 0.25 }	
	0.26 to 0.60	5c. per 100 lb.
	0.61 to 1.25	15c. per 100 lb.
When maximum of range specified is—		
Open-hearth	0.09 }	5c. per 100 lb.
Bessemer	0.07 }	

For Manganese		
0.30 to 0.90		No extra
0.91 to 1.15		10c. per 100 lb.
1.16 to 1.35		20c. per 100 lb.
1.36 to 1.50		25c. per 100 lb.

(For manganese content above 1.15 the above extras do not apply to steel with carbon under 0.20 maximum.)

For Silicon		
0.10 to 0.25		10c. per 100 lb.
0.26 to 0.50		20c. per 100 lb.

For Sulphur		
0.07 minimum to 0.10 minimum		10c. per 100 lb.

For Copper		
Up to 0.20 minimum		10c. per 100 lb.

For Phosphorus		
(Not to apply on sheet bars.)		
0.04 minimum to 0.08 minimum		5c. per 100 lb.

(Extra for phosphorus content applies to open-hearth steel only.)

Extras for Physical Specifications

When material is ordered to physical properties, the extras for the required chemical contents shall apply. Orders specifying both physical properties and carbon contents will not be accepted.

The following ranges of elements are standard:

Carbon		
Up to .25 inclusive		5 points
.26 to .65 inclusive		10 points
.66 to 1.05 inclusive		15 points
1.06 and over		20 points
Manganese		
Up to .70 inclusive		20 points
.71 to 1.50 inclusive		30 points
Silicon		
Up to .20 inclusive		10 points
.21 to .30 inclusive		15 points
.31 to .50 inclusive		20 points

Specifications calling for closer ranges can only be adhered to at an extra cost unless a combination of orders is so arranged that all steel coming within the standard ranges can be applied.

This Issue in Brief

Cuts controllable manufacturing expense almost 12 per cent by budgeting each department on basis of payroll. Foreman of each department in Stutz plant receives a weekly report of indirect expense (including indirect labor, shop supplies, etc.), which shows standard allowance per \$100 of payroll. Prizes are awarded each month for best records. One clerk handles entire system.—Page 334.

* * *

You can not always widen your market by cutting your price. Many markets are restricted by factors other than price, so that price reductions produce no gain or a relatively insignificant gain in demand.—Page 339.

* * *

Apathetic stockholders are a brake on efficient management. "I believe in the responsibility of stockholders," says Link-Belt Co. head. Unless stockholders take an interest in the affairs of the company the disadvantages of a hired management make themselves felt.—Page 340.

* * *

Welds four additional stories to old six-story steel building. Cleveland fabricator inserts welded angles down the center of old hollow columns, joining old steel to new steel at five-foot intervals by means of welded plates. Cap plates welded to top of old columns serve as base for four-story H column.—Page 338.

* * *

Plating is done automatically in Ford plant. Parts are hung on suspension frames, which are placed on conveyor hangers. A revolving arm picks the hangers off the conveyor and lifts hangers from tank to tank. Dipping is purely mechanical and is evenly timed.—Page 342.

* * *

Plates small parts in wooden tumbling barrels. Ford immerses and revolves barrels in cadmium plating solution. A cathode is placed inside the barrel, coming in contact with the work as it revolves.—Page 342.

Iron-making capacity is declining. Blast furnace capacity was 49,605,720 tons on Jan. 1, 1928, and 51,379,400 tons one year earlier, a loss of 3.4 per cent.—Page 344.

* * *

To remove prejudice and preference, place iron and steel freight charges on a mileage basis, Commerce Commission examiners recommend. Territory affected is the northeastern section of the country. New scale would cost railroads about \$2,000,000 a year, according to some estimates.—Page 345.

* * *

Small manufacturers can save money by forming a cooperative tool shop, says engineer. Combination of a group of manufacturers would provide funds for buying modern equipment, engaging special tool-makers for each class of work, insuring quicker deliveries, and economies produced by steady operation of equipment.—Page 346.

* * *

Abandons individual and group piece work rates in favor of bonus system based on standard hourly performance. Stutz calculates "standard" by taking time-study time plus 25 per cent for bonus. Bonus is paid for beating the time-study time.—Page 337.

* * *

Almost every industry will benefit directly by Jones-White law, fostering American merchant marine, says shipbuilder. Shipyards buy from practically every industry. Material bills for each big ship run over \$7,000,000, representing about half the total cost.—Page 343.

* * *

Industrial production has increased about 8 per cent in last five years while factory employment has declined and wages increased. Economic progress is indicated by higher output and higher wages per worker.—Page 356.

Foreman is called to account when his total indirect departmental expenses show up "in the red." Automobile manufacturer gives each foreman a weekly record of his expenses as compared with predetermined standards. Explanations gathered each week by the comptroller are submitted to the management each month.—Page 335.

* * *

"Fixed buying fund" idea is a fallacy, says head of big corporation. It is wrong to assume that the public has so much to spend and that the fight is for the buyer's extra dollar. If you can create a new demand, the necessary buying power seems to be there.—Page 340.

* * *

If the operators beat the standard the foreman's record is credited. But if performance is below standard, losses are charged against the departmental budget. Thus the foreman sees that all his operators make as high a daily rate as possible, in Indiana automotive plant.—Page 337.

* * *

"Unemployment" is largely imaginary, Labor Federation statistics indicate. Even in flush times, statistics show that 7 to 8 per cent of workers are idle, and figures gathered in twenty-four large cities show that union laborers in all industries except building trades were 93 per cent employed in June.—Page 354.

* * *

Not many industries can adopt mass production methods profitably. And there are definite limits to production even in those industries that lend themselves to mass output, says Charles Piez. "The economies from large-scale output are a constant temptation to increase production first and worry about sales afterward." Selling cost on the surplus oftentimes outweighs heavily the saving in manufacturing cost.—Page 339.

THE IRON AGE

W. W. MACON
Managing Editor

ESTABLISHED 1855

A Union View of Unemployment

A LARGE part of the space in the August issue of the *American Federationist*, the well-edited magazine of the American Federation of Labor, is given over to the discussion of unemployment—whether there is such a thing, and if so what are the remedies. The main impression left by these articles is that in general, union labor is not suffering from any shortage of work to do.

One article, using a statistical analysis of the United States census of manufactures, attacks the fundamental question, "When does unemployment begin?" or, stated another way, "How many people are out of work during periods of general prosperity?" This census gives the number of workers employed in about 350 industries for each month of the year. Selecting the highest figure for each industry during the year, and adding these together, gives a total which is supposed to represent the number of workers in those industries. Subtracting from this total the total number actually at work in a given month, gives the number of unemployed in that month. Averaging the derived percentages, month by month, gives the following unemployment: For 1914, 8.8 per cent; for 1919, 11.9 per cent; for 1921, 13.2 per cent; for 1923, 6.6 per cent; for 1925, 7.9 per cent. The author concludes that unless more than 7 or 8 per cent of the available workers are out of work, a state of "unemployment" can hardly be said to exist.

On the very next page is an analysis of unemployment in trade unions in twenty-four of the large cities during 1928. The totals have been steadily decreasing since January, and in June the total unemployed in all trades was 11 per cent. Segregating the building trades, it is found that their unemployment averages 22 per cent, while for all other trades the unemployment is 7 per cent. We know that the total of construction contracts is breaking all previous records, consequently there must be (generally speaking) work for those in the building trades who really seek it. And by their own figures, union laborers in other urban trades are employed to an almost unprecedented extent.

By other articles in this same magazine one is reminded that there are certain sore spots in the labor market. Not to mention the coal industry, an analysis of conditions shows that 29 per cent of the unionized workers in Philadelphia were unemployed during some part of March and April. The corresponding figure for 1927 was 19 per cent. Causes for this situation as seen by local union officials are various. Most believe that it is a normal seasonal fluctuation, or results from normal turnover; a contributing factor is the "general business depression caused by over-production, which

in turn is caused by speeding up and introduction of labor-saving machinery." (This, by the way, is a normal, continuing factor.) Changes in technique, style, non-union competition, migration of industry, politics, strikes, the Eighteenth Amendment, the failure of the Naval expansion bill—such causes for unemployment, put forward in all seriousness by men close to the workers, indicate how complicated the problem really is.

An interesting story of how the city of Wilmington, Del., scotched alarmist reports of unemployment appears on another page of the *Federationist*. In the spring the local press and pulpit were deploring the "tens of thousands" of unemployed "tramping the streets vainly in search of work." The whole city (with the exception of the Chamber of Commerce's publicity bureau) was depressed. Then Mayor Forrest, at the behest of several civic organizations, established an employment bureau, which has had the active cooperation of the local industries. While hundreds of men have been placed, "the report of thousands being unemployed has been proved to be incorrect. Talk of unemployment makes for more unemployment. Statistics don't make jobs, but Wilmington today is talking 'employment.'"

Such evidence certainly does not support alarmist reports about suffering among the wage earners, if such reports were ever given serious attention. It is well known that the representative labor unionist is constantly driving for higher wages and shorter hours, and is seldom if ever content with existing conditions. Consequently the reports in his official magazine can hardly be expected to be colored with roseate hues. Yet it seems that urban workers (except such as bricklayers and plumbers) are employed to nearly a record extent; that the causes of unemployment in certain exceptional centers are so various that they seem to be largely local manifestations, and finally that some "unemployment" may be found to be mythical, when a real search for idle workers is made.

Coal Miners and Economic Law

REPORTS from such conferences as officials of the United Mine Workers of America have been able to get with coal producers in the hope of making a fresh working agreement only confirm what has been plain to some minds, that operation of certain mines on a union basis and of others as non-union or open shop is futile. While the United Mine Workers have abandoned the so-called Jacksonville wage scale as a basis of negotiation, they still cling to the idea that the operators in Ohio, Indiana and Illinois (there have

been no conferences in central or western Pennsylvania) should be willing to pay a higher scale than now rules in the open shop districts.

The conferences between Ohio and Illinois operators, and the district executives of the miners' union, have failed of results because the operators wanted a scale that would be in line with existing wages in the fields with which they are in direct competition. On the other hand the union leaders contended that if they accepted the operators' suggestion, it would mean in turn a reduction in the open shop rates and a wage situation no different from what hitherto has existed. It is a little surprising that the union leaders are so concerned as to the effect the scale at which they will permit their members to work will have upon wages in open shop districts. If, they argue, they accepted the operators' proposal of \$5 a day for day labor in the Illinois mines, Kentucky operators would at once cut their scales enough to retain markets they have taken from Illinois operators. But why not reason that such action by the Kentucky producers would lead to discontent among their men and thus pave the way for unionization?

Is not this position of the union negotiators a practical admission that the United Mine Workers must muster much more numerical strength in the industry as a whole before they can enforce their demands upon any considerable part of it? The union has reached its present state of weakness by concentrating all its effort on wresting from soft coal operators a high and constantly mounting scale of wages. Now that it is shut up to a wage fixed by the public demand for coal, it finds economic law sitting on the other side of the conference table—a negotiator whose measure up to this time it has never thought it necessary to take.

Market Study a Prime Need

MASS production is an overworked term. Foreign visitors who have studied American industry commonly ascribe our prosperity to methods of mass manufacture. They are impressed by the spectacular, as exemplified by our automobile plants, but fail to see the whole picture.

The fact that relatively few businesses lend themselves to mass production is pointed out by Charles Piez, chairman Link-Belt Company, in an interview elsewhere in this issue. Much engineering work is designed and built to meet special requirements. Mass products enter only in the form of certain standard parts. The whole building industry, one of our major activities, is mainly based on contract work in which mass methods of operation play a minor role. Mass goods like structural steel, lumber, brick, tile and radiators are used in construction, but the building operation itself still consists of the execution of special plans and specifications.

The relation of mass production to market expansion is also frequently misunderstood. While the automobile industry has been able to reduce prices and increase sales by expanding output, that principle does not apply in fields with limited markets.

Lower prices would have little effect on the consumption of coal, beef or flour, but excessive production would be, and in the bituminous coal industry has been, disastrous. Outside of the mass production field the idea of increasing consumption by cutting

prices is illusive. A price difference of a few hundred dollars up or down will not raise or lower the demand for electric traveling cranes. Cranes are bought because they are wanted for a specific purpose. If one crane is needed in a plant no price inducement will lead to the purchase of two.

Mr. Piez has shown the danger of sweeping generalizations about our complex industrial organism. He has focused attention, moreover, on the importance of market research. Intelligent selling is the great need of the times. One must know his field and know it well before he can sell to advantage. Thorough study of markets will lead the way to the most effective and economical sales policy.

Industries Growing Into Maturity

IT is not fanciful to consider industries as passing through stages corresponding with the development of the individual human being, having infancy, adolescence, maturity and then further usefulness. Some difficult present problems in industry have light shed upon them by this comparison. We shall refer in particular to the steel industry, the automobile industry and the railroads.

In all three there has been and is regret that they do not "grow" as they used to. What does the human do? He "grows" in stature for a couple of decades, then reaching a so-called "maturity," but for decades afterward he grows in usefulness as the lives of many leaders in all lines of activity have testified.

It can be said that steel making has reached maturity, but only in the sense of its having attained a large tonnage. Does the consumer want weight in bridges, in automobiles, in airplanes? In the last five years steel tonnage has gained only in approximate proportion to the increase in population. The steel industry has reached a maturity by rapid growth in stature, but its usefulness is marked for continued and great increase by steel becoming more serviceable, pound for pound, as the years pass. Then it behooves producers to act as those having attained maturity, to put aside adolescent thoughts of physical growth and adopt the thoughts of maturity looking to growth in service, by making steel more adaptable and useful rather than by making more tonnage than is needed.

The automobile industry has reached a similar "maturity." The largest production, cars and trucks in the United States and Canada, in twelve consecutive months was the production in the twelve months through May, 1926. But the automobile increases in usefulness, in service rendered, and will continue to do so. Earnings reports of automobile companies show that the producers have an eye to profit rather than volume, as the industry is not in line for producing at much more than one-half its "capacity." The makers impress the public with their improvements in quality and appearance, in which they have an advantage over the steel producers. Eventually of course there will be less in this point.

Freight ton-mileage on the railroads used to double quite regularly every dozen years. Lately there has been no marked tendency for it to increase. Railroad-ing is not going down hill; it has simply reached a maturity in stature. There are new forms of transportation, by water and motor truck, which are having

their growth now. The railroads have their place. There is a large amount of transportation service which they are best fitted to render. The railroads are growing in efficiency. The fact that they do not buy many new freight cars does not show that they are going backward. American Railway Association reports show 96,753 freight cars installed in 1926 and 103,863 retired; in 1927, 71,040 installed and 91,435 retired, and in the first half of this year 28,651 installed and 42,867 retired, indicating a net decrease in number of cars in service of 41,721. The actual total in service was reported at 2,347,275 for Dec. 31, 1925, and 2,300,595 for June 30, 1928, making 46,680 decrease; but total capacity increased one-tenth of 1 per cent and average capacity per car from 44.77 net tons to 45.72 net tons.

Steel making, automobile production and railroad-ing, have grown up in stature but have long lives of increasing usefulness before them. Their functioning in maturity must differ from that of adolescence and they must come to a full realization of the fact.

Production, Employment and Wages

IN the Federal Reserve Bulletin are comprehensive statistics in succinct form of production, employment, factory payrolls and other things in the form of index numbers beginning with 1919 and running through May of this year. There is opportunity for a study of relationships showing that industrial production has increased in the last three years, also this year, that factory employment has decreased and that payrolls have decreased less, indicating larger earnings per man.

Index numbers for the three items are given below. For industrial production the base, 100, is the 1923-4-5 average. For the other two items 1919 is taken as base.

	Index Numbers		
	Industrial Production	Factory Employment	Factory Payrolls
1919.....	83	100	100
1920.....	87	103	124
1921.....	67	82	84
1922.....	85	90	89
1923.....	101	104	113
1924.....	95	95	104
1925.....	104	95	107
1926.....	108	96	109
1927.....	106	92	105
1928			
January ...	106	88	98
February ..	110	89	104
March	109	90	105
April	109	89	103
May	109	89	104

Considering industrial production as a separate item, we see a large increase in 1923. The increase over 1919 and 1920, when there seemed to be so much activity, and goods appeared to be scarce, was 19 per cent, marking the difference between inefficiency and shirking right after the war and reasonable efficiency after there had been a spell of hard times. Then we see further and fairly consistent gains up to and including this year; but the gain in five years has been only about 8 per cent, approximately the population gain.

It has been made clear in previous discussions of production and employment in THE IRON AGE that statistics showing the release of workers from indus-

tries whose activities are studied do not represent corresponding increases in unemployment, for workers go into new forms of employment. Unfortunately it is impossible even to estimate closely how nearly a balance is struck. The comparison between industrial production and factory employment is useful chiefly as an index of increasing efficiency in production methods. An index is obtained by dividing industrial production by factory employment, making 83 for 1919, 97 for 1923 and 122 for the first five months of this year, a remarkable progression indeed.

As to wages paid, an index is obtained by dividing factory payrolls by factory employment, making 100 for 1919, 109 for 1923 and 116 for this year, which is likewise a favorable progression.

All the figures are gratifying, as showing economic progress along sound lines. There is going to be much talk in the next few months about unemployment, with vague references to legislation. Talkers should be pinned down to actualities such as are indicated by these figures. Factories cannot be forced to produce more, or to employ more men in producing what they do. If politicians can bring about new forms of activity and patrons for them, let them go to it. If anything is needed it is that.

CORRESPONDENCE

Marking Ingots for Identification When Rolled Into Billets

To the Editor:—It will be found an impossible task to identify steel after rolling, by any paint or crayon marking prior to cogging or blooming, for two very definite reasons:—reduction of area and oxidation. Granting that you found it possible to secure a paint or crayon which would survive the furnace heat, you would find the marks distorted beyond recognition by the process of reduction.

Taking a 6-in. square ingot of 300 lb. weight and reducing it to a 2-in. square billet, the proportions will be as follows:

A 6-in. square x 28-in. or 300-lb. ingot will give a surface area on four sides of 672 sq. in. The same ingot reduced to 2 in. square gives a length of 22 ft. and 2112 sq. in. surface area. The comparison is 672 sq. in. to 2112 sq. in., or over three times the original area, which proves that the surplus area is secured by the metal working out from the interior during rolling.

Oxidation in the form of scale formation on commercial steels at normal temperatures of furnace heating will "shuck" off a paint or crayon mark to its practical extinction. Saw-marks and any form of nicking are prohibitive for the same reason, as reduction would distort them beyond recognition, as well as because of surface disfigurement and numerical limitation of this method.

The only definite and certain way of securing the desired result is to use a tab of special non-oxidizing metal containing all the desired information. These tabs would be marked as desired for any identification and one inserted in the sink head of each ingot while it is still soft after pouring. This method will survive the furnace heat and will also carry through undisturbed during the mill operations, permitting easy and sure recognition of each billet.

EDWARD J. CUBLER.

4504 Weitzel Avenue, Baltimore, July 22.

Sources and Distribution of Ore in 1927

(Figures indicate tonnage in units of 100,000 tons)

July Pig Iron Output Falls Off

Complete Data Show the Daily Rate 3642 Tons
or 3.5 Per Cent Less Than June—
Net Loss of Four Furnaces

ACTUAL data for the pig iron production in July reveal considerable variation from the estimate published in THE IRON AGE, Aug. 2. The actual July output was higher than the estimate by 257 tons per day. The July rate was 99,091 tons per day compared with 98,834 tons per day as the estimate in the compilation of which the last two days of July were calculated by the producing companies.

Total July coke pig iron production was 3,071,824 gross tons or 99,091 tons per day for the 31 days as contrasted with 3,082,000 tons or 102,-

733 tons per day for the 30 days in June. This is a decrease for July of 3642 tons per day, or 3.5 per cent. The estimate last week showed a decrease of 3.8 per cent. July is the third month in succession to show a decrease, the June recession having been 3 per cent. Last year the July production was 2,951,160 tons or 95,199 tons per day. Thus the decline in July this year of 3.5 per cent in the daily rate compares with a decrease in July last year of 7.5 per cent.

Capacity Active Aug. 1

There were 185 furnaces active on

Aug. 1, having an estimated operating rate of 98,445 tons per day. This contrasts with an operating rate of 100,855 tons per day for the 189 furnaces active on July 1. Seven furnaces were blown in during July and 11 were shut down. Of the furnaces blown in, two were Steel Corporation stacks, four were independent steel company units, and one was a merchant stack. The 11 furnaces shut down were as follows: Steel Corporation, five furnaces; independent steel companies, three furnaces, and merchant producers, three furnaces. Thus the Steel Corporation had a net

*These totals do not include charcoal pig iron. The 1927 production of this iron was 164,569 tons.

Daily Pig Iron Output in July Was About 3.5 Per Cent Less Than in June; Composite Price Decreases Slightly
Inclined line represents the gradually increasing theoretical needs of the country, ascertained by a balancing of the ups and downs in production. It shows an average yearly increase in consumption of about 415,000 tons

loss of three furnaces for the month, independent steel companies a net gain of one furnace, and merchant companies a net loss of two furnaces.

Steel and Merchant Iron

Steel-making iron in July was made at the rate of 79,513 tons per day, which was about 80 per cent of the total. In June the 81,630 tons per day of steel-making iron was also about 80 per cent of the total daily rate for the month. Merchant iron was, of course, about 20 per cent in each case. In July, 1927, the merchant iron was nearly 27 per cent of the total daily rate.

Possibly Active Furnaces Reduced

The Carbon furnace in the Lehigh Valley, the Tod furnace of the Youngstown Sheet & Tube Co. in the Mahoning Valley, and one Iroquois stack of the Youngstown Sheet & Tube Co. in the Chicago district have been abandoned during the last month and will be dismantled. This reduces the number of possibly active blast furnaces in the United States from 342 to 339.

Furnaces Blown In and Out

During July the following furnaces were blown in: One Bethlehem stack of the Bethlehem Steel Co. in the

Lehigh Valley; one Sparrows Point furnace of the Bethlehem Steel Co. in Maryland; one Donora furnace of the American Steel & Wire Co.; one Carrie furnace of the Carnegie Steel Co., and one Eliza stack of the Jones & Laughlin Steel Corporation, in the Pittsburgh district; the Colonial furnace in western Pennsylvania, and one Indiana Harbor furnace of the Youngstown Sheet & Tube Co. in the Chicago district.

Furnaces blown out during the month were as follows: One Susquehanna stack of the Hanna Furnace Co. and the Niagara furnace in the Buffalo district; one Sparrows Point stack of the Bethlehem Steel Co. in Maryland; one Carrie, one Clairton and one Edgar Thomson furnace of the Carnegie Steel Co., and one Midland furnace of the Pittsburgh Crucible Steel Co. in the Pittsburgh district; one Farrell furnace of the Carnegie Steel Co. in the Shenango Valley; one Hubbard stack of the Youngstown Sheet & Tube Co. in the Mahoning Valley; one Gary furnace of the Illinois Steel Co. in the Chicago district, and one Ford stack in Michigan.

Another New Record in Ferromanganese

At 32,909 tons the July output of ferromanganese was again the largest since separate records have been kept, surpassing the 32,088 tons made in June.

Iron and Steel Markets

Demand Continues at July Rate

Improvement Extended to Railroad Car Industry—Steel Prices

Firmer—Extras Likely for Special Steels—Pig Iron

Buying Movement Under Way

ONE full week of August continues the record of sustained steel consumption which marked July. Output was slightly curtailed by hot weather, particularly in sheet and tin plate mills, but this served only to hold back shipments slightly and without disturbance to consumers, seeing that demand, while for known needs, is not essentially urgent.

The steel ingot returns for July emphasize the unusual summer activity. The production of open-hearth and Bessemer steel showed an expansion of nearly 2 per cent over June, besides immediately following a record half-year output. It was 19 per cent greater than the production of July, 1927, and the increase over June this year compares with a falling off last year of more than 8 per cent, from June to July. The 3,811,573 gross tons turned out last month brought the seven months' total nearly 1,600,000 tons ahead of the like period of 1927.

The improvement has extended to the railroad car industry, which has taken contracts for 550 cars for the Pennsylvania Railroad and is now figuring on cars and underframes for the Great Northern, which will require 45,000 tons of steel.

The diversified sources of business are indicative of a notably healthy situation among most manufacturing lines using pig iron as well as steel, for pronounced activity in forward pig iron covering in several centers is one of the week's developments. In Chicago steel sales have not been exceeded by any appreciable margin since the last week of March, when operations were close to capacity.

One result is that prices are showing more firmness than in many weeks. In the heavy tonnage products (plates, shapes and bars), orders are small, so well are large consumers covered, but where they figure back to a Pittsburgh basis, they all seem to be done at 1.90c. a pound. On black sheets 2.65c., Pittsburgh, is more common and on a larger tonnage than recently, and the mills now are expected to seek an advance on fourth-quarter business. Makers of strips also are taking a notably firm price stand.

An imminent promulgation of new extras for special analysis steels, to apply where there are measurable production costs for providing particular contents of carbon, silicon, manganese or other elements, is an illustration of the efforts to get remunerative prices. Charges of \$1 to \$5 a ton are comprehended on both semi-finished and finished steel. The proposal comes closely after that limiting the discount for cash payments on sheets, strips and hoops to ½ per cent instead of 2 per cent.

Complete returns of pig iron production last month

show an output of 3,071,824 gross tons, or 99,091 tons a day, a recession of 3.5 per cent from June. On Aug. 1 the 185 furnaces active were making iron at a rate of 98,445 tons a day, against 189 on July 1 producing at a rate of 100,855 tons. The net changes among active stacks were two fewer merchant furnaces, a loss of three Steel Corporation units and a gain of one among independent steel companies.

A pig iron buying movement of large proportions is under way in the Central West. At Cleveland, 50,000 tons was sold on top of close to that amount in the previous week. Chicago sales in July were 150,000 tons and business so far this month has continued at a corresponding rate. The market also is more active in the East, the week's sales at New York totaling 20,000 tons. About 50,000 to 75,000 tons of Buffalo iron, being brought down by barge from Buffalo furnaces, will be stored at New Jersey tidewater points to be reshipped by rail during the fall and winter to nearby consumers.

Heavy melting steel has moved up 75c. a ton at Pittsburgh and 25c. a ton at Chicago. There has been no marked increase in demand, but supplies are scarcer because of the low prices which have been prevailing.

Fabricated structural steel demand still gives high promise. New projects appearing in the week call for 52,000 tons, including 11,000 tons for 98 barges for the Mississippi River Commission, 6300 tons for a railroad bridge over Newark Bay and five buildings in Chicago requiring 2000 to 2500 tons each. Bookings amounted to 22,500 tons.

Present commitments for tin plate are sufficient to insure practically full operation through all next month. The Pacific Coast is now to have a tin plate plant, the Columbia Steel Corporation announcing plans to erect mills of 50,000 tons annual capacity at Pittsburg, Cal.

Tonnage from the pipe mills is coming chiefly from the oil companies for line pipe. The Youngstown Sheet & Tube Co. will supply 25,000 tons for 165 miles of a 14-in. line from Amarillo, Tex., to Enid, Okla. One oil company is believed to have 450 miles, or over 100,000 tons, to buy, and a proposed Wyoming to Salt Lake project calls for 350 miles of 20 or 22-in. pipe.

A new set of railroad freight rates on iron and steel now before the Interstate Commerce Commission would establish a mileage basis as a way to remove "undue prejudice and undue preference." Freight charges into New England from Pittsburgh would be 10 per cent higher, the Chicago-St. Louis rate would be raised from 22c. to 26c., the Ohio short haul rates would be discarded and there would also be numerous reductions. Arguments on exceptions made meanwhile will be heard probably in late October or in November.

Pittsburgh

Tendency Toward Firmer Steel Prices as Mills Hold Recent Gain in Plant Engagement

PITTSBURGH, Aug. 7.—The steel industry is holding its recent gain in plant engagement, although it is probable that actual production has suffered somewhat from extremely hot weather. In point of specifications, the reports for the past week are quite as cheerful as those of the week before. Ingot production, on the basis of the units reported as active, still is fully 75 per cent, but considerable difficulty has been experienced in maintaining full crews in the sheet and tin mills on account of the heat, and it is probable that output of other classes of finishing mills has suffered from the same cause. This, however, merely means a slight backing up of orders and is not disturbing to either producers or consumers, as the demand, while constant, is not always urgent. More interesting than the fact that general business is running above normal for this time of year is the tendency of prices toward greater firmness.

While new business in bars, plates and shapes is limited by the fact that consumers generally are under cover for this quarter's requirements, the little that is coming out is finding sellers firm at 1.90c., base, Pittsburgh. A price of 2.65c., base, on black sheets is being named by more makers and on more tonnage than recently. Strip makers also are firmer in their prices. Preferential price treatment is more restricted. Indeed,

the disposition to make steel a more profitable commodity is gaining headway. There is not only the evidence of the reduction in the cash discount on sheets, strips, hoops and tin plate that producers have announced, but a list of chemical extras imposing a charge where there is a production cost, will be issued and will add to prices of all forms of semi-finished and finished products.

Scrap prices have advanced further

in this market; while there is some mill buying, the strength finds its chief explanation in nervousness among dealers who have gone short of the market and are alarmed by the very moderate offerings. There is little life to the pig iron market. In coke and coal, the condition still is that producers are seeking buyers rather than the reverse.

Pig Iron.—One sale of 500 tons of Bessemer iron is reported and scattering sales of this grade bring the total to about 1000 tons. There is no interest in basic iron and in foundry and malleable grades. Sales have been entirely of single carloads and orders have resulted more from active solicitation by sellers than from a pressing need on the part of melters. Steel foundries in this area still are running at under rather than above 50 per cent of capacity and engagement of close to 75 per cent of radiator and sanitary ware foundry capacity does not help pig iron sales much because operators are so well covered on their requirements. The movement on contracts is steady. Prices hold where they were a week ago. There are suggestions that less than \$16.50, Valley furnace, has been

done on No. 2 foundry, but they seem to be based on the fact that in some cases producers have not insisted on the full silicon differential for No. 2X grade. In view of the very limited demand, the silicon differentials of 50c. per half point of silicon are not being closely observed and 25c. is the usual demand. Most producers want as much for No. 3 and gray forge iron as for No. 2 foundry, but on the other hand have taken \$16.75 for No. 2X. There is still a quotation of \$16.75 for No. 2 grade. W. P. Snyder & Co. make the July average prices of basic and Bessemer iron from Valley furnaces \$16 and \$17, respectively, compared with \$15.43 and \$17 in June.

Prices per gross ton, f.o.b. Valley furnace:

Basic	\$16.00
Bessemer	17.00
Gray forge	\$16.25 to 16.50
No. 2 foundry	16.50 to 16.75
No. 3 foundry	16.25 to 16.50
Malleable	17.00
Low phos., copper free....	26.50

Freight rate to Pittsburgh or Cleveland district, \$1.76.

Ferroalloys.—New business in ferromanganese, spiegeleisen and high grade ferrosilicon does not amount to much, as most users are under contract for the remainder of the year. As the steel industry is operating at a surprisingly high rate for this time of the year, specifications against ferroalloy contracts are above the seasonal average. Prices hold at recent levels.

Semi-Finished Steel.—A high rate of engagement of sheet and tin mills is reflected in specifications for sheet bars. Strip mill operations are down a little from what they were recently and this development has caused a corresponding letdown in the movement of billets and slabs. Prices are unchanged, with current shipments going at \$32, but with \$33 asked on new billet and slab business and also mentioned as the fourth quarter price of sheet bars. Buyers are meeting with no success in efforts to break \$42, base Pittsburgh, on wire rods.

Bars, Plates and Shapes.—The market is becoming more fully established at 1.90c., base Pittsburgh, on these products. It is the uniform quotation of mills here and rules on shipments

other than on contracts, which commonly are priced at 1.85c. Few buyers failed to secure full coverage for this quarter at 1.85c., and strictly new business does not reach very sizable proportions. Bar and shape specifications are coming along well. Plates are not doing as well as the others, but more than 12,000 tons is in sight in river barges and scows. On Aug. 17 bids will be opened at Memphis for 98 barges for the Mississippi River Commission, requiring 11,000 tons of plates and small shapes.

Wire Products.—Business is running a little behind that done at this time last year, but so far as prices are concerned there have been few periods in recent years when they were any more firmly maintained than they are now.

Rails and Track Supplies.—Specifications against contracts for spikes and other track supplies are somewhat heavier than they were recently. Not much new buying is being done. Light-section rails and small spikes still are dull.

Tubular Goods.—Fairly good demand is noticed for oil well pipe from the Seminole, Okla., field and from California, but it is for deep well drilling and runs heavier in seamless than in welded pipe. Standard-weight pipe is moving steadily for building and construction work. The chief prop to an average engagement of 70 per cent pipe-making capacity, however, is in line pipe. The Youngstown Sheet & Tube Co. recently took 25,000 tons of 14-in. pipe for a line to run from Amarillo, Tex., to Enid, Okla. Like other recent awards, this calls for early shipment. That company, also Spang, Chalfant & Co. and the National Tube Co. are busy on line pipe. The Texas Co. is reported to have placed with a Milwaukee fabricator 450 miles of 24-in. pipe for a gas line; that diameter, weighing 87 lb. per ft., would mean over 100,000 tons. This company has not yet closed for an oil pipe line to run from western Texas to Port Arthur, calling for 20,000 to 25,000 tons of 4 to 12-in. pipe. A 350-mile gas line is being projected to run from Wyoming to Salt Lake City, but this is probably

some distance away from an award, since franchises have not yet been granted.

Sheets.—Since all sheet consuming industries are normally busy for this time of the year and some upturn is noted in the activities of the farm implement manufacturers, sheet specifications still are flowing in at a good rate and mill operations show no recession. Production is somewhat under the rate of mill engagement on account of the extreme heat, which has made difficult the maintenance of full crews. The market appears stronger on black sheets and efforts to establish a minimum of 2.65c., base Pittsburgh, are meeting with some success. On galvanized sheets, the range remains at 3.40c., to 3.50c., base, while blue annealed sheets, produced by the jobbing mill as distinct from the strip mill product, hold at 2c., base.

Tin Plate.—Production has suffered rather heavily from excessively hot weather and while all of the mills are in operation, a good many turns have been lost, owing to the inability of mill managers to obtain full crews. The American Sheet & Tin Plate Co., which has been working an extra turn on Saturdays to make up for production lost during the week, was unable to work this turn last Saturday on account of the heat. Present commitments are sufficient to insure practically full hot mill operations through all of next month.

Cold-Finished Steel Bars and Shafting.—Demand, as typified by specifications, is holding up well to the recent average. Automobile parts makers are ordering steadily on contracts, but not in excess of their actual requirements. The market is firm at 2.10c., base Pittsburgh, with an advance likely on fourth quarter business in view of the stronger tendency in hot-rolled bar prices.

Hot-Rolled Flats.—Besides the fact that specifications for strips are holding up well for the time of year, the market is featured by a steadier price situation. Makers generally want higher prices on fourth quarter tonnages and realize that price weakness at this juncture would defeat

Above prices are for hot-rolled steel bars, forging quality. The ordinary differential for cold-drawn bars is 1c. per lb. higher. For billets 4 x 4 to 10 x 10 in., the price for a gross ton is the net price for bars of the same analysis. For billets under 4 x 4 down to and including 2½ in. squares, the price is \$5 a gross ton above the 4 x 4 billet price.

Slabs with sectional area of 16 in. or over carry the billet price; slabs with sectional area of 12 in. to 16 in. carry a \$5 extra above the billet price and slabs with a sectional area under 12 in. carry the bar price.

Band sizes are 40c. per 100 lb. higher.

Rails

Per Gross Ton

efforts that may be made to get them. Makers of hoops have announced a reduction in the cash discount of from 1 per cent to one-half of one per cent, effective Oct. 1.

Cold-Rolled Strips.—As specifications on contracts continue to exceed expectations for this time of the year, the occasion does not exist for active solicitation of new business. Prices, though no higher than they have been, at least are steadier.

Bolts, Nuts and Rivets.—Firm prices, but only moderate activity still is the story of these products.

Warehouse Business.—Warehouse prices of sheets have been lowered \$2 per ton in keeping with the lower mill bases recently reached. Business is better in sheets than it was a month or so ago and is fairly active in the other steel products.

Coke and Coal.—Standard beehive oven furnace coke for spot or prompt delivery still is hard to buy at less than \$2.75 per net ton at ovens. This is the result of recent purchases by a steel company to supplement its by-product oven production and the fact that, with no assurance of a sustained demand, no ovens have been put into production. There are offerings of 48-hr. coke at \$2.65, which would be taken for blast furnace use if the requirements were urgent. Standard foundry coke sells commonly from \$3.75 to \$4, but there are offerings as low as \$3.25 and choice brands are priced from \$4.25 to \$4.85. The coal market still is very dull and prices are easy.

Old Material.—Heavy melting steel this week is quotable from \$14.50, at which one mill in the district bought a fair-sized tonnage, to \$15.50, which is the price reported to have been obtained for offerings of this grade in the August list of the Pennsylvania Railroad. Since the railroad steel went to a dealer, there is the inference that the mill at the point of delivery paid \$16, but this is not confirmed.

Cement coated nails, per keg	3.05

firm. Mill buying has not been conspicuous lately and the stronger tendency which the market has lately developed finds its chief explanation in the fact that the short interest is large at two points and dealers are disturbed because not much scrap is coming out. Compressed sheets have moved up with heavy melting steel and the higher prices also are supported by sales. The market is also firm on machine shop turnings and on blast furnace grades. There is 4034 gross tons in the August scrap list of the Norfolk & Western.

Prices per gross ton delivered consumers' yards in Pittsburgh and points taking the Pittsburgh district freight rate:

Basic Open-Hearth Grades:	
Heavy melting steel.....	\$14.50 to \$15.50
Scrap rails	14.00 to 15.00
Compressed sheet steel.....	14.50 to 14.75
Bundled sheets, sides and ends	13.50 to 13.75

Cupola Grades:	
No. 1 cast	14.25 to 14.50
Rails 3 ft. and under.....	15.00 to 15.50

Rainey Interests Acquire Clyde Coal Co.

W. J. Rainey, Inc., New York, has bought the property of the Clyde Coal Co., comprising approximately 1000 acres of coal land, and on and near the Monongahela River a short distance south of Brownsville, Pa. A report that the purchaser had made a long time contract with the Sharpsville Furnace Co. to supply 30,000 tons of coal a month from the Clyde mine to a by-product coke plant to be built on Neville Island to serve the blast furnace recently bought from the United States Steel Corporation, however, is unconfirmed.

Activity in New England

The Strand & Sweet Mfg. Co., Winsted, Conn., enameled wires, is working on two 12-hr. shifts.

The north side H. B. Smith Co., Westfield, Mass., heater plant is now operating with a night shift. Early in the year there was talk of closing the plant because of a lack of business.

The Dunbar Brothers Co., Bristol, Conn., springs, did more business

during the first half of 1928 than in the whole of 1927. It reports substantial unfilled orders on its books and has a larger force than at any other time in its history except during the war.

Confirming earlier reports of an unsatisfactory textile machinery market in New England, the Foster Machine Co., Westfield, Mass., is operating at not more than 60 per cent of capacity. The company expects no real improvement in the machinery market until the many changes entering into the textile situation have run their course.

Scranton Mill Acquired For Lebanon Iron Co.

The Scranton Bolt & Nut Co., Scranton, Pa., has been taken over by interests represented by Charles Hart, president Delaware River Steel Co., Chester, Pa. For a number of months Mr. Hart has been active in reorganization work at the Lebanon Iron Co., Lebanon, Pa., and it is expected that the two companies will be closely connected. At present, however, no change will be made in the personnel or plant of either. Mr. Hart has been elected president and a director of the Scranton Bolt & Nut Co.

Valley Mills Operating 75 to 80 Per Cent

YOUNGSTOWN, Aug. 7.—Hot weather during the past week curtailed production at Valley iron and steel plants somewhat, though schedules are being well maintained at rates of recent weeks. Some steel makers estimate that output this summer will come close to establishing a mid-year record, especially in tin mills.

Steel ingot production is sustained at 75 to 80 per cent average. The Republic Iron & Steel Co., the Youngstown Sheet & Tube Co. and the Carnegie Steel Co. are averaging fully 75 per cent.

Inflow of new business is at the rate of recent weeks. Of 53 independent open-hearth furnaces, 40 are melting, a loss of one compared with the preceding week; 14 of 20 pipe mills are in action and 99 of 127 sheet mills. Bar, plate, strip and tin mills are maintaining the schedules of recent weeks. Independent Bessemer steel production is at 60 per cent.

A ten-story structure, an addition to Bullock's, Los Angeles, represents a record in speedy construction, according to the American Institute of Steel Construction. The old buildings on this site were demolished in April. The finished piers for the beams were in place May 1 and by June 1 all of the steel framing was in place. The structural steel amounting to 1172 tons, was erected in 15 working days, according to the Llewellyn Iron Works, Los Angeles, who were responsible for the job.

Chicago

Western Steel Market Holds Gains of Last Few Weeks— Great Northern Seeks 2500 Cars

CHICAGO, Aug. 7.—There is every indication that the local steel market has held the gains made in the last few weeks. Prices for finished steel products, however, are not steady at 2c., Chicago, for the reason that some sellers continue to use 1.95c. per lb. for bargaining purposes, and still lower quotations are being made to fabricators and tank builders where specific tonnages are involved. This situation is expected in some quarters to change as mill order books slowly grow and as producers gain greater confidence in the trend of the market for the remainder of this quarter.

In finished steel, sales are the best since the week ended June 23 and have not been exceeded by an appreciable margin since the seven-day period ended March 31. Specifications, which match well with new business, are in greater volume than in any week since May 19 and have not been exceeded since the last week in March. It is worthy of note that weekly comparisons of business can go back to the closing week in the first quarter, when operations were close to capacity.

There is no change in the character of business. The improvement is general, even now extending to the car industry, which has begun to figure on 2500 freight cars and 2000 underframes for the Great Northern. This inquiry calls for 1000 ore cars, 500 gondolas, 500 flat cars and 500 box cars, which, with the steel needed for the underframes, will add not far from 45,000 tons of steel to producers' books.

Rail mill operations are fair, considering that this is beyond the time when such shipments are usually made. The Chicago, Rock Island & Pacific has applied for permission to build a 6-mile spur in Arkansas.

Following a sharp increase in building permits in Chicago, there is now over 15,000 tons of new structural inquiry before local fabricators. Awards during the week totaled 3000 tons.

Ferroalloys.—Prices for 19 to 21 per cent spiegeleisen range from \$31, Hazard, Pa., in tonnages to \$33 a ton in car lots, several sales of the latter size having been made during the week. Some of the foreign product is being offered freely at \$32. Ferromanganese is quiet and quotations are based on \$105, seaboard.

Prices delivered Chicago: 80 per cent ferromanganese, \$112.56; 50 per cent ferrosilicon, \$83.50 to \$87.50; spiegeleisen, 19 to 21 per cent, \$40.76.

Pig Iron.—The steady buying movement that started several weeks ago in the Northern iron market is still in evidence. Some buyers, having covered for the remainder of the year, are sufficiently attracted by present prices to make inquiry for tonnages to be delivered after Jan. 1. Inquiry for shipment in this and the next quarter is not being broadcast, buyers preferring to enter the market quietly. A few small orders to the west and south are being filled by iron from Granite City at prices that are governed by Chicago furnace quota-

tions and local freight rates. Some of this iron is reaching into territory where freight differentials favor Chicago producers. A Chicago user has ordered 2000 tons of foundry iron. A melter in Iowa will buy 1500 tons of Southern iron. Purchases in July totaled 150,000 tons and the daily rate in August compares favorably with that in July.

Prices per gross ton at Chicago:
N'th'n No. 2 fdy., sil. 1.75 to 2.25... \$17.50
N'th'n No. 1 fdy., sil. 2.25 to 2.75... 18.00
Malleable, not over 2.25 sil..... 17.50
High phosphorus 17.50
Lake Super. charcoal, sil. 1.50.... 27.04
So'th'n No. 2 fdy. (all rail)..... 21.51
So'th'n No. 2 (barge and rail)..... 21.01
Low phos., sil. 1 to 2, copper free \$28.50 to 29.00
Silvery, sil. 8 per cent..... 29.79
Bess. ferrosilicon, 14-15%..... 46.79

Prices are delivered consumers' yards except on Northern foundry, high phosphorus and malleable, which are f.o.b. local furnace, not including an average switching charge of 61c. per gross ton.

Structural Material.—The outlook in structural material is taking a sudden change for the better as 10,000 tons in new projects comes before the trade. In Chicago, the Thompson Building and the Ruboff Garage will each require 2000 tons, and an extension to Wacker Drive calls for 2500 tons. The revival of the McCormick Estate building project promises 2500 tons additional, and if a permit is granted to the United States Gypsum Co. for a plant in the Calumet district another 2500 tons will be added to the active list. Noteworthy among awards are 1000 tons for a viaduct at Topeka, Kan.; 600 tons for highway bridges at Oklahoma City, Okla., and 500 tons for a school at Muncie, Ind. Building permits in Chicago during July were 41 per cent larger than in July, 1927, and 4 per cent larger than in June, this year. This situation is lending encouragement to fabricators, who have been engaged close to capacity in recent weeks, but who lacked the assurance that operations would be maintained even as far ahead as Sept. 1. Two large projects in Chicago are being held in check. The Fine Arts Building, requiring 5000 tons, cannot go ahead at present because bids for rehabilitation of the structure exceed the amount of the funds provided in the bond issue. The Patterson Estate building is delayed while the design is being changed. On the general run of business, shape prices are steady at 2c.; however, on highly competitive projects 1.90c., Chicago, is being done.

Mill prices on plain material, per lb.: 2c., base, Chicago.

Plates.—New orders for plates for oil storage tanks are scarce, the total amounting only to 1000 tons. Inquiry, however, bulks large and the changed outlook throughout the oil industry gives steel producers encouragement. Specifications against recent business are large, the bulk of orders being for immediate shipment. Except for an inquiry from the Great Northern for 2500 freight cars and 2000 steel underframes, the railroad equipment market is quiet. Little business is coming to the steel trade from car builders. It is reported here that 150 of the all-steel refrigerator cars recently ordered by the Pennsylvania Railroad will be built in shops near Chicago. The Chicago, Burlington & Quincy is considering building 33 suburban passenger cars in its shops at Aurora, Ill. Plate mills are engaged at close to 70 per cent, due in large measure to demands of pipe makers, the building industry and oil field work.

Mill prices on plates, per lb.: 2c., base Chicago.

Bars.—Demand for soft steel bars remains near the high level reached a week ago. Local mills are engaged close to 80 per cent of capacity and occasionally a unit is found which is operating at capacity. In a few sizes deliveries have been pushed forward, the range now being three to five weeks. Reinforcing bar dealers are taking larger quantities, while the automobile industry and manufacturers of farm implements find that their needs are not diminishing. Unsteadiness in prices is no more marked than during the last three weeks. In scattered cases a seller will use 1.95c., Chicago, as a bargaining price, or he will drop to that figure for an attractive order. To offset this, however, several sizeable sales to industrial users at 2c. are reported. Demand for rail steel bars is steady and shipments do not quite measure up to production. Deliveries range from four to six weeks except for the more extended dates for tube products made from old rails.

Mill prices per lb.: Soft steel bars, 2c., base, Chicago; common bar iron, 2c., base, Chicago; rail steel bars, 1.85c., base, Chicago Heights mill.

Reinforcing Bars.—This week follows in the path of late July in the placing of contracts. Fresh inquiry is of good size and more is to come, as indicated by the activity of architects. Total business in the first seven months of this year was not equal to that in the corresponding part of 1927. Small orders are growing in number and shop schedules are well balanced. Some unsteadiness is noted in warehouse prices for billet steel bars, weakness being more evident in large tonnage quotations than on orders for 100 tons and less. Recent awards and fresh inquiries are shown on page 375.

Sheets.—Sales continue in fair volume and hot mill bookings are growing. This incoming business is in sufficient volume to defer any material profit which might come to producers through an advance in sheet prices.

That an advance is in sight now appears probable, but its effect will be more as a gesture toward getting higher prices for fourth quarter business than as a move that will widen margins of profit over the next 45 to 60 days. In some quarters it is believed that an advance now will lead to a second increase of \$2 a ton before the opening of the next quarter. Present prices at Chicago are 2.15c. per lb. for blue annealed sheets, 3.65c. for galvanized and 2.80c. for black sheets. Local sellers have not as yet taken definite action in establishing one half of 1 per cent discount in place of the 2 per cent for cash in 10 days, which some mills have announced will take effect Oct. 1. Current specifications, plus new business for immediate release, are holding hot mill operations at 75 to 80 per cent of capacity, and schedules are better arranged and further in advance than in late July. The roofing trade is actively buying against its fall needs.

Base prices per lb., deliv'd from mill in Chicago: No. 24 black sheets, 2.80c.; No. 24 galv., 3.65c.; No. 10 blue ann'l'd, 2.15c. Deliv'd prices at other Western points are equal to the freight from Gary plus the mill prices, which are 5c. per 100 lb. lower than Chgo. deliv'd prices.

Rails and Track Supplies.—Miscellaneous orders continue to reach this market and local rail mills are holding to 50 per cent of capacity. One railroad has placed 4000 tons of standard-section rails, this being new business over and above the old contract and option. The Milwaukee Harbor Commission will take figures on 750 tons of rails and 250 tons of track accessories. Track supply output holds to 70 to 80 per cent of capacity, a range that has been maintained for several weeks. Chicago mills are looking for the fall rail buying movement to start in September. Considerable optimism exists over the outlook for rail purchases, following exceptionally satisfactory crops that are now maturing in the West and Northwest.

Prices f.o.b. mill, per gross ton: Standard-section open-hearth and Bess. rails, \$43; light rails, rolled from billets, \$36. *Per lb.:* Standard railroad spikes, 2.80c.; track bolts with square nuts, 3.80c.; steel tie plates, 2.15c.; angle bars, 2.75c.

Old Material.—The strength shown in this market a week ago is being

carried forward and has now spread to the specialties. Electric furnace users have more business and are buying for future requirements. Less sales resistance is being offered by operators of gray iron foundries. It is reported from Milwaukee that an accumulation of heavy melting steel, which is said to have totaled over 75,000 tons at one time, has largely been absorbed by users in Chicago. This is having a strong influence on the local market. A heavier use of scrap at steel mills is reflected in lessened restriction as to the rate of shipments. Dealers are paying over \$13.25 a gross ton for heavy melting steel to be applied against old orders. The possibility of boat shipments of scrap from Chicago appear to hinge around the difficulty of the rapid assembling of the tonnage needed in order to avoid the per diem charge on the boat. An industrial producer offers 250 tons of cast iron borings.

Prices deliv'd Chicago district consumers:

Per Gross Ton	
Basic Open-Hearth Grades:	
Heavy melting steel.....	\$12.75 to \$13.25
Shoveling steel	12.75 to 13.25
Frogs, switches and guards, cut apart, and misc. rails	13.50 to 14.00
Hydraulic compressed sheets	11.25 to 11.75
Drop forge flashings.....	9.50 to 10.00
Forg'd, cast and r'l'd steel carwheels	15.50 to 16.00
Railr'd tires, charg. box size	15.50 to 16.00
Railr'd leaf springs, cut apart	15.50 to 16.00
Acid Open-Hearth Grades:	
Steel couplers and knuckles	13.75 to 14.25
Coil springs	15.75 to 16.25
Electric Furnace Grades:	
Axle turnings	12.50 to 13.00
Low phos. punchings.....	14.00 to 14.50
Low phos. plate, 12 in. and under	14.00 to 14.50
Blast Furnace Grades:	
Axle turnings	9.00 to 9.50
Cast iron borings.....	9.25 to 9.75
Short shoveling turnings..	9.00 to 9.50
Machine shop turnings....	6.00 to 6.50
Rolling Mill Grades:	
Iron rails	13.50 to 14.00
Rerolling rails	14.75 to 15.25
Cupola Grades:	
Steel rails less than 3 ft..	15.25 to 15.75
Angle bars, steel.....	14.50 to 15.00
Cast iron carwheels.....	12.75 to 13.00
Malleable Grades:	
Railroad	12.50 to 13.00
Agricultural	11.50 to 12.00
Miscellaneous:	
*Relay'g rails, 56 to 60 lb.	23.00 to 25.00
*Relay'g rails, 65 lb. and heav.	26.00 to 31.00

Per Net Ton	
Rolling Mill Grades:	
Iron angles and splice bars	13.50 to 14.00
Iron arch bars and transoms	19.50 to 20.00
Iron car axles.....	24.00 to 24.50
Steel car axles.....	15.50 to 16.00
No. 1 railroad wrought...	10.75 to 11.25
No. 2 railroad wrought...	11.25 to 11.75
No. 1 busheling.....	9.50 to 10.00
No. 2 busheling.....	5.75 to 6.25
Locomotive tires, smooth.	12.00 to 12.50
Pipes and flues.....	8.00 to 8.50
Cupola Grades:	
No. 1 machinery cast.....	13.50 to 14.00
No. 1 railroad cast.....	12.75 to 13.25
No. 1 agricultural cast....	12.50 to 13.00
Stove plate	10.75 to 11.25
Grate bars	11.25 to 11.75
Brake shoes	10.00 to 10.50

*Relaying rails, including angle bars to match, are quoted f.o.b. dealers' yards.

Cast Iron Pipe.—The bulk of going business, which is in small lots this week, is being taken at \$35 a ton, Birmingham, and quotations on large tonnages are close to \$34. Current business is for the most part of car lot proportions and fresh inquiry is

small in the aggregate, though several municipalities in and near Cook County, Illinois, are giving consideration to purchases of cast iron pipe. Two public utility companies have ordered a total of 800 tons, and several railroads have taken small tonnages. The only public inquiry of note is for 300 tons of 16 to 48-in. pipe for Columbus, Ohio. Total sales in the first seven months of this year lagged behind those in the corresponding period in 1927. Several foundries report low stocks on hand.

Prices per net ton, deliv'd Chicago: Water pipe, 6-in. and over, \$42.20 to \$43.20; 4-in., \$46.20 to \$47.20; Class A and gas pipe, \$4 extra.

Hot-Rolled Strip.—Chicago district mills continue to operate at capacity, as users, including automobile frame makers, press for deliveries and release specifications at a steady rate. Prices are steady at 2c. to 2.30c. per lb., Chicago, depending on the width desired.

Wire Products.—Reports of current business vary, but as judged by shipments the general average strikes not far from the level of last week. Mill output remains at 60 to 65 per cent of capacity. Mill stocks are adequate and are being held stationary except in reinforcing mesh, which is in large demand at this time of the year. Sales to the manufacturing trade have grown in the last seven days. Jobbing trade in rural districts is quiet, but the outlook for the fall trade is favorable as based on the apparent assurance that crops will be large. New purchases and specifications by the railroads are light. Demand for nails remains sluggish, especially in rural districts. Reports of a sharp increase in building permits in Chicago in July hold some promise for a better demand from the local building trade.

Coke.—Shipments are steady and all ovens are lighted. Prices for by-product foundry coke are \$8, f.o.b. local ovens, and \$8.75 a ton, delivered in the Chicago switching district.

Bolts, Nuts and Rivets.—Specifications are steady. The industry is engaged at between 60 and 65 per cent of capacity.

Increases Land Holdings at Economy

Spang, Chalfant & Co. have acquired from the Columbia Steel & Shafting Co. approximately 44 acres of land which the latter bought about eight years ago at Economy, Pa., as a site for a plant which was to have combined the facilities of its plants at Carnegie and Rankin, Pa. Having previously acquired the land holdings of the Economite Society, Spang, Chalfant & Co. now hold title to about 500 acres of industrial land in Economy, or substantially all there is that is not occupied. The most recent purchase adjoins the site of the Standard Seamless Tube Co., now part of Spang, Chalfant & Co. An announcement as to the utilization of the land will be made this fall.

Warehouse Prices, f.o.b. Chicago	
Base per Lb.	
Plates and structural shapes.....	3.10c.
Soft steel bars.....	3.00c.
Reinforc'g bars, billet steel.....	2.30c. to 3.00c.

Philadelphia

July Activity in Steel Buying Continues, but Prices Still Show \$1 a Ton Range

PHILADELPHIA, Aug. 7.—The steady flow of steel business, which reached such satisfactory proportions in July, is continuing into the present month, so that sellers are beginning to view the third quarter with considerable optimism. Prices are still slightly irregular, the quoted market price applying in most cases only on small lots for prompt shipment. Sheet mills are endeavoring to stabilize prices on blue annealed, black and galvanized sheets by eliminating concessions of \$1 a ton on blue annealed and black and \$2 a ton on galvanized, but the lower levels are still obtainable, especially by distributors and other preferred buyers. Bar and plate prices show more firmness than quotations on shapes, but concessions from 2c. per lb., Pencoyd, on shapes have become less common than a few weeks ago.

Pig Iron.—Eastern Pennsylvania furnaces are maintaining \$19.50 per ton, base, on the foundry grade, but present inquiries, which range from a carload to 100 or 200 tons, offer little test of the market. Although Buffalo iron is being sold to many consumers in this district, sellers here are beginning to discount some of the low prices claimed by buyers. On a carload of foundry iron for the United States Navy Yard, Philadelphia, the Delaware River Steel Co. was low bidder and on a carload for the Brooklyn Navy Yard the Alan Wood Iron & Steel Co. was low. The Baldwin Locomotive Works, Eddystone, Pa., has closed on 2000 tons of cylinder iron with an eastern Pennsylvania steel company furnace.

Prices per gross ton at Philadelphia:

East. Pa. No. 2, 1.75 to 2.25 sil.	\$20.26
East. Pa. No. 2X, 2.25 to 2.75 sil.	20.76
East. Pa. No. 1X.	21.26
Basic (del'd east. Pa.)	\$18.75 to \$19.25
Gray forge	19.75 to 20.25
Malleable	21.00 to 21.50
Stand. low phos. (f.o.b. N. Y. State furnace)	22.00 to 23.00
Cop. b'r'g low phos. (f.o.b. furnace)	23.00 to 23.50
Va. No. 2 plain, 1.75 to 2.25 sil.	24.54
Va. No. 2X, 2.25 to 2.75 sil.	25.04

Prices, except as specified otherwise, are deliv'd Philadelphia. Freight rates: 76c. to \$1.64 from eastern Pennsylvania furnaces; \$4.54 from Virginia furnaces.

Billets.—Sales of rerolling quality at \$32 per ton are less common, most mills maintaining the market at \$33 per ton, Pittsburgh, on rerolling grade and \$38, Pittsburgh, for forging billets.

Bars.—While most mills are quoting 1.90c., Pittsburgh, or 2.22c., Philadelphia, on new business, it apparently applies for the most part to small orders for prompt shipment. Current contracts are, with few exceptions, at 1.85c., Pittsburgh, or 2.17c., Philadelphia, and desirable tonnages for delivery in this quarter usually bring out this price. Bar mills are well booked with orders, having had in July one of the best months of the year. Local construction projects requiring reinforcing bars seldom exceed 30 or 40 tons.

Shapes.—Prices are still considerably less than the scheduled market of 2.05c., Bethlehem, or 2.18c., Phila-

delphia, but concessions from 2c., Pencoyd, or 2.06c., Philadelphia, are less common, the bulk of present business being reported at 2.06c. to 2.08c., delivered Philadelphia.

Plates.—On small tonnages for prompt shipment 2.05c., Coatesville, usually applies, but larger business is at \$1 a ton less, or 2.10c., delivered Philadelphia, which is the current contract price. Mills report a good volume of business, especially large for midsummer.

Sheets.—Despite recent efforts of mills to maintain prices at a higher level, black sheets are still obtainable by preferred buyers at 2.60c. per lb., Pittsburgh, or 2.92c., Philadelphia, a concession of \$1 a ton from the quoted market; galvanized sheets still bring 3.40c., Pittsburgh, or 3.72c., Philadelphia, which is \$2 a ton lower than the price some mills are trying to maintain. There are still occasional instances of slight concessions from 2c., Pittsburgh, or 2.32c., Philadelphia, on blue annealed sheets, but most sales of this product show no concession.

Warehouse Business.—Effective Aug. 1, jobbers in this district advanced prices on bars and bar-size shapes 10c. per 100 lb. to 2.70c. per lb., base. The early part of July was active, but the final week of the month registered a slight decline in tonnage

Warehouse Prices, f.o.b. Philadelphia

	Base per Lb.
Plates, ¼-in. and heavier	2.50c. to 2.60c.
Plates, ⅜-in.	2.80c. to 3.00c.
Structural shapes	2.40c. to 2.60c.
Soft steel bars, small shapes, iron bars (except bands)	2.70c.
Round-edge iron	3.50c.
Round-edge steel, iron finished 1½ x 1½ in.	3.50c.
Round-edge steel, planished	4.30c.
Reinforc. steel bars, sq. twisted and deform.	2.50c. to 3.00c.
Cold-fin. steel, rounds and hex.	3.35c.
Cold-fin. steel, sq. and flats.	3.85c.
Steel hoops	3.50c.
Steel bands, No. 12 to ⅝-in., inclus.	3.25c.
Spring steel	5.00c.
*Black sheets (No. 24)	3.85c.
†Galvanized sheets (No. 24)	4.60c.
Blue ann'd sheets (No. 10)	3.15c.
Diam. pat. floor plates—	
¼-in.	5.30c.
⅜-in.	5.50c.
Rails	3.20c.
Swedish iron bars	6.60c.

*For 50 bundles or more; 10 to 49 bun., 4.10c. base; 1 to 9 bun., 4.35c. base.
†For 50 bundles or more; 10 to 49 bun., 4.95c. base; 1 to 9 bun., 5.30c. base.

moving from stock, and the total of orders in the first few days of the present month is also smaller.

Imports.—In the week ended Aug. 4 there were no arrivals of pig iron at this port, but a total of 14,623 tons of iron, manganese and chrome ore was received. Of this, 246 tons of iron ore was from Spain, 2000 tons of chrome ore from Portugal and, of three shipments of manganese ore, 7350 tons came from Russia, 5016 tons from British West Africa and 11 tons from Germany. Ferromanganese totaling 130 tons came from the United Kingdom and 50 tons of steel scrap arrived from Germany. Steel arrivals consisted of 406 tons of structural shapes from Belgium, 24 tons of steel bars from Germany and 46 tons of billets from Sweden.

Old Material.—Prices show little change, with a plentiful supply of scrap available at the present market levels. A small tonnage of machine shop turnings has been bought by a consumer at Phoenixville, Pa., for \$10.50 per ton, an advance of 25c. a ton from its previous purchase price. A mill at Claymont, Del., has bought close to 10,000 tons of No. 1 heavy melting steel from two dealers at \$13 per ton, delivered. A small tonnage of cast iron carwheels was closed last week at \$15.75 per ton, delivered, but a desirable order would apparently still bring out \$15 per ton.

Prices per gross ton delivered consumers' yards, Philadelphia district:

No. 1 heavy melting steel.	\$13.00
Scrap T rails.	12.50
No. 2 heavy melting steel.	\$10.50 to 11.00
No. 1 railroad wrought.	13.50 to 14.50
Bundled sheets (for steel works)	9.50 to 10.00
Machine shop turnings (for steel works)	10.00 to 10.50
Heavy axle turnings (or equiv.)	12.00 to 13.00
Cast borings (for steel works and roll. mill)	10.00 to 10.50
Heavy breakable cast (for steel works)	14.00 to 15.00
Railroad grate bars.	11.00 to 11.50
Stove plate (for steel works)	10.50 to 11.00
No. 1 low phos., hvy., 0.04% and under.	17.50 to 18.00
Couplers and knuckles.	14.50 to 15.00
Rolled steel wheels.	14.50 to 15.00
No. 1 blast f'nace scrap.	9.50 to 10.00
Wrot. iron and soft steel pipes and tubes (new specific.)	12.00 to 12.50
Shafting	16.50 to 17.00
Steel axles	19.00 to 20.00
No. 1 forge fire.	11.00
Cast iron carwheels	15.50 to 15.75
No. 1 cast.	15.50 to 16.00
Cast borings (for chem. plant)	14.50 to 15.00
Steel rails for rolling.	14.50 to 15.00

Pacific Coast Plant to Make Tin Plate

Tin plate is to be produced on the Pacific Coast for the first time in February, 1929, according to an announcement by the Columbia Steel Corporation, San Francisco. The directors of the company recently made an appropriation of \$4,300,000 for plant extensions, \$2,500,000 of which is to be used in constructing a tin plate mill at the Pittsburgh plant of the company. The new mill, when completed, will have a capacity of 50,000 tons per year.

New York

Pig Iron Sales Total 20,000 Tons—Structural Steel Outlook Continues Promising

NEW YORK, Aug. 7.—Pig iron sales amounting to more than 20,000 tons made the past week the most active of the summer and inquiries are coming out daily which promise to maintain a satisfactory volume of buying for the greater part of the month. There are also indications that prices have not shown further weakness, and any change which may have taken place seems to be on the side of firmness. Outstanding among the week's transactions was the purchase by the Eastern Malleable Iron Co. of 6000 tons of malleable for delivery over the remainder of the year to its five plants. The business is said to have been divided between two and possibly three furnaces. Another sale of 2000 tons is reported, and the Richmond Radiator Co. has closed against its inquiry for 1500 tons of foundry iron for Norwich, Conn. The bulk of this tonnage is said to have gone to the Massachusetts maker. Other sales of from 500 to 1000 tons are reported and smaller purchases include 200 tons of foundry iron for spot shipment to the Schenectady, N. Y., works of the American Locomotive Co. and 100 tons of silvery for the New York Air Brake Co. at Watertown, N. Y. Reported purchase of a substantial tonnage by the American Radiator Co. cannot be confirmed, although the company is expected to buy iron for its various Eastern plants in the near future. New inquiry, totaling from 10,000 to 12,000 tons, includes 4000 tons of No. 2 plain and No. 2X for shipment over the rest of the year to the two plants in northern New Jersey of a large furnace manufacturer. Some 3000 tons will be bought by another melter in this district, and smaller inquiries include a lot of 700 tons, 500 tons for a New England consumer and 250 tons for a melter in the New York territory. Buffalo furnaces are shipping foundry iron by barge to storage yards at New Jersey tidewater points and it is estimated that from 50,000 to 75,000 tons will have been accumulated by the time navigation on the State barge canal closes in the fall. One interest has storage facilities at Elizabethport and another at Jersey City and the iron will be reshipped by rail to Eastern consumers as the demand arises. While this movement virtually amounts to an extension of the time during which barge competition from Buffalo can affect this market, a curtailment of production at furnaces in that district seems to be leading to a somewhat better price situation. The Hanna Furnace Co. has blown out a Susquehanna stack and only three furnaces at Buffalo are now operating on foundry iron. The price of this grade still ranges from \$16 to \$16.50, furnace, and instances of cutting the lower figure are seldom heard outside

of highly competitive New England territory. An adjustment of freight rates on the New York, New Haven & Hartford Railroad in that district is said to have been favorable to the

Freight rates: \$4.91 from Buffalo, \$1.39 to \$2.52 from eastern Pennsylvania.

Sheets.—Although no definite announcements have reached local selling offices, there are reports of a prospective advance in sheet prices. Meanwhile, some headway has been made in bringing about a degree of stabilization in present quotations. On black sheets, 2.65c., Pittsburgh, is the objective of most of the mills, and while 2.60c. may not have disappeared, it is more difficult for the buyer to find a mill willing to quote this price. On galvanized sheets, the situation is fairly well defined, with 3.40c. as the minimum and 3.50c. the maximum. Blue annealed sheets are fairly steady at 2c., particularly when quoted on by the jobbing mills. Coverage for the remainder of the quarter can be obtained at prevailing prices, but mills are cautious about making any commitments which might be construed as an effort on the part of buyers to provide for some of their fourth quarter requirements at present prices. The sheet trade is confident that prices will be at least \$2 a ton higher for the last quarter.

Plates, Shapes and Bars.—Sales totals for July computed by offices in New York were 10 to 15 per cent ahead of those for the same month last year, but generally were somewhat below the volume of business booked in this district in June. Orders during the first week of August have been keeping up to the July rate. That some consumers have enjoyed a larger business this quarter than they expected is indicated by several requests for extension of third quarter contracts. Some mills have been willing to make extensions at 1.85c. for actual requirements of buyers, while others have insisted on 1.90c., Pittsburgh, or the Eastern basing of 2.05c. Few instances of this kind have arisen, however, as nearly all buyers are covered for the quarter at the 1.85c. basis, and sales at 1.90c. are usually to the small buyers who did not make contracts. Some mills, as previously reported, have asked customers to specify all third quarter tonnage not later than Sept. 10, but in view of the usual practice of permitting specifications up to the last day of the quarter, the success of this change will not become apparent until Sept. 10 has arrived. Some buyers are expected to interpret their contracts as giving them the right to specify at any time within the 90 days, especially as the present contract form contains no wording which places any other limitation on the time for specifying. The volume of structural steel business continues to

increase, and there are a sufficient number of new projects in the market to afford excellent prospects for sustained activity. Structural mill schedules are better filled, and there is a lengthening of deliveries on some sizes. Prices quoted on fabricated material are also said to be slightly firmer, reflecting the higher prices which fabricators will have to pay. Structural steel awards for three sections of New York subways are being held up until after the meeting of the Board of Estimate on Aug. 16. Section 2, route 109, requiring 9400 tons, has been tentatively awarded pending approval by the board, and there are two other sections, one calling for 11,000 tons and the other for 4000 tons, which probably will be approved at the same time. About 6400 tons will be needed for approach spans for a Newark Bay bridge, to be used jointly by the Pennsylvania and Lehigh Valley Railroads. The Pennsylvania has bought 550 all-steel express refrigerator cars of a new type from four car builders.

Mill prices per lb., deliv'd New York: Soft steel bars, 2.19c. to 2.24c.; plates 2.12½c. to 2.22½c.; struct. shapes, 2.14½c. to 2.19½c.; bar iron, 2.14c.

Old Material.—Prices on most grades are stronger and in some cases brokers are offering from 25c. to 50c. per ton more than a week ago. No. 1 heavy melting steel is being purchased by brokers at \$12.50 per ton, delivered eastern Pennsylvania, to cover on \$13 contracts totaling about 10,000 tons for a Claymont, Del., consumer. Yard grade of heavy melting steel is quoted at \$10 to \$10.50 per ton, the lower price delivered to a Pottsville, Pa., mill and the higher quotation for Harrisburg and Conshohocken, Pa. Machine shop turnings are going to a Phoenixville, Pa., consumer at \$10 per ton, delivered. Heavy cast scrap in charging box size is being shipped to Conshohocken, Pa.

Dealers' buying prices per gross ton, f.o.b. New York:

No. 1 heavy melting steel.	\$9.00 to	\$9.85
Heavy melting steel (yard)	6.25 to	6.75
No. 1 hvy. breakable cast.	10.00 to	11.00
Stove plate (steel works)...	6.75 to	7.25
Locomotive grate bars....	6.75 to	7.25
Machine shop turnings....	6.25 to	6.50
Short shoveling turnings...	6.25 to	6.50
Cast borings (blast furn. or steel works).....	6.00 to	6.50
Mixed borings and turnings	6.00 to	6.50
Steel car axles.....	15.00 to	15.50
Iron car axles.....	23.50 to	24.00
Iron and steel pipe (1 in. dia., not under 2 ft. long)	8.25 to	8.75
Forge fire	6.50 to	6.75
No. 1 railroad wrought....	9.00 to	9.50
No. 1 yard wrot., long....	7.50 to	8.00
Rails for rolling.....	10.00 to	10.50
Cast iron carwheels.....	11.00 to	12.00
Stove plate (foundry)....	8.25 to	8.75
Malleable cast (railroad)...		10.00
Cast borings (chemical)...	10.75 to	11.25

Prices per gross ton, deliv'd local foundries:

No. 1 machy. cast.....	\$14.00 to	\$15.00
No. 1 hvy. cast (columns, bldg. materials, etc.), cupola size	12.00 to	13.00
No. 2 cast (radiators, cast boilers, etc.)	11.50 to	12.50

Warehouse Business.—Jobbers report a steady improvement in volume of orders, the first week of the month showing a larger total of shipments from stock than the first week of July. Prices are being maintained with very little shading, except on black

and galvanized sheets. The quoted range of prices on sheets is 3.80c. to 4c. per lb., base, for black and 4.50c. to 4.70c., base, for galvanized. In some instances, however, as low as 4.35c. on galvanized and 3.65c. on black are reported obtainable. Discounts on machine and carriage bolts and coach screws in the small sizes appear to have settled to 60 per cent off list even for the smaller lots, which formerly were quoted at 55 per cent off.

Reinforcing Bars.—Awards during the last week have been light but a considerable tonnage will be required in new projects which have come out recently. A causeway at Jones Beach, L. I., calls for 850 tons; a warehouse in New York, 600 tons; a boardwalk at Rockaway Beach, 325 tons; sewer work in the Borough of Queens, 350 tons, and two buildings for the Western Electric Co. at Kearny, N. J., 300 tons. Small orders are coming at about the same rate which prevailed during July. There has been no change in prices.

Cast Iron Pipe.—Southern makers continue to quote on a basis of \$34 to \$35 per net ton, base, Birmingham, which is \$43.25 to \$44.25 per ton, delivered New York, but Northern makers are maintaining \$37.60 to \$38.60 per ton, delivered; in some cases where competition is keen these prices are shaded by \$1 to \$2 a ton and more. The usual midsummer quiet pervades the market and buying is

limited to small lots. A municipal inquiry of size calls for 117,650 ft. (3260 tons) of 6, 8, 12 and 16-in. water pipe, classes A and B, for Fairlawn, N. J., bids opening Aug. 14. Alternate bids are being taken on centrifugal pipe. The American Construction & Securities Co., New York, is reported to have placed orders totaling about 850 tons of pipe in the past week for various properties. This is in addition to about 800 tons bought a fortnight ago.

Prices per net ton, deliv'd New York: Water pipe 6-in. and larger, \$37.60 to \$38.60; 4-in. and 5-in., \$42.60 to \$43.60; 3-in., \$52.60 to \$53.60; Class A and gas pipe, \$4 to \$5 extra.

Coke.—A somewhat firmer price tendency has developed in furnace coke and buyers are now forced to pay at least \$2.75 for this grade on August and September shipments. Some Connellsville interests have curtailed production to the extent that their order books are well filled during the remainder of the quarter and are not willing to take business at \$2.75. Foundry coke is unchanged at \$3.50 per net ton, Connellsville, and specifications against contracts are very satisfactory for this time of year. Special brands of foundry coke are offered at \$4.85, f.o.b. ovens, and delivered prices are \$8.56 per net ton to northern New Jersey, Jersey City and Newark and \$9.44 to New York and Brooklyn. By-product foundry coke is unchanged at \$9 to \$9.40, Newark or Jersey City, and \$10.06 to \$10.29, New York or Brooklyn.

Cleveland

Betterment in Demand for Steel Accompanied by Firmer Price Tone—Large Pig Iron Sales

CLEVELAND, Aug. 7.—Bookings of bars, shapes and plates in the first week of August show no letdown from the high average reached in the latter part of July, and in some cases an increase in orders and specifications is noticed. Shipments by district mills continue liberal and production is being carried along at a rate which is unusually satisfactory for this season of the year. While considerable tonnage is originating in the automobile industry, the diversified sources of recent business are indicative of a healthy situation among most manufacturing lines using steel. Concurrent with the betterment in demand is a further strengthening of prices. Mills are insisting that customers having the advantage of preferential prices must take the remaining tonnages on current contracts before the third quarter expires and this attitude is having the effect of imparting to the market an underlying tone of firmness.

Steel bars are quoted at 1.90c., Cleveland, although 1.85c. has not yet disappeared, while plates range from 1.85c. to 1.90c., Pittsburgh, with small miscellaneous lots bringing the latter figure. Shapes apparently are fairly well established at 1.90c., Pittsburgh.

The amount of inquiry before the trade presages a continuation of buying and of production on a scale which is considerably above normal for August. Greater activity is noted in structural steel, the outstanding event of the week having been the awarding of 4000 tons for bridge work in East Cleveland, which is a part of the local Union Terminal project. In general, fabricators in this district are run-

ning their shops on a curtailed basis, but reports from Michigan say that fabricating plants there are sufficiently well engaged to maintain operations at the present rate during the remainder of the summer.

The Wheeling & Lake Erie has purchased 1000 tons of 90-lb. rails from the leading interest.

A revival of interest in pig iron reported a week ago has developed into a somewhat formidable buying movement, sales in the past two weeks by Cleveland companies having aggregated more than 90,000 tons.

Pig Iron.—For the second consecutive week pig iron buying has been heavy, sales by Cleveland interests

having exceeded 50,000 tons. Apparently users are convinced that prices are scraping bottom and that there is a possibility of a strengthening in the market which may carry quotations to a higher level. Consequently, many melters are covering their requirements for the remainder of the year, although orders for spot shipment also are numerous. Business placed in Michigan has been the largest since early in the spring, foundry operations having been stimulated by the demand for castings from automobile companies which have recently announced new models. In fact, most of the tonnage bought in the past few weeks is destined for outside delivery, local consumers having been a minor factor in the market. In the first week of August the movement of iron on third quarter contracts increased beyond the average in July, and producers are confident that shipments this month will run ahead of those last month. So far as prices are concerned, there is a further tendency toward firmness, although no changes have been made. Local furnaces are so well fortified with third quarter orders that quotations for delivery to outlying competitive territories are reported to be from 25c. to 50c. a ton higher. In Michigan, foundry iron is selling at from \$17.50 to \$18, while iron for local delivery is steady at \$17.50, base furnace. Demand for low phosphorus iron is almost at a standstill.

Prices per gross ton at Cleveland:

N'th'n fdy., sil. 1.75 to 2.25.....	\$18.00
S'th'n fdy., sil. 1.75 to 2.25.....	21.50
Malleable.....	18.00
Ohio silvery, 8 per cent.....	28.00
Basic Valley furnace.....	16.00
Stand. low phos., Valley furn.....	26.50

Prices, except on basic and low phosphorus, are delivered Cleveland. Freight rates: 50c. from local furnaces; \$3 from Jackson, Ohio; \$6 from Birmingham.

Iron Ore.—Shipments from upper Lake ports in July totaled 8,980,859 tons, an increase of 4.32 per cent compared with July, 1927. For the entire year to Aug. 1, the movement of iron ore amounted to 23,275,984 tons, which is a decrease of 3,104,521 tons, or 11.77 per cent, compared with that in the same period of 1927.

Bolts, Nuts and Rivets.—Specifications and orders have been unusually good and have come from diversified sources, although automobile companies, agricultural implement manufacturers and jobbers have contributed the bulk. Production is being sustained at a rate regarded as above normal for midsummer. Quotations are firm and unchanged.

Warehouse Prices, f.o.b. Cleveland

Base per Lb.

*Net base, including boxing and cutting to length.

Semi-Finished Steel.—Demand from contract customers increased slightly the past week so that shipments are at a fairly high level. Furthermore, production is on a scale somewhat greater than usual for August. Sheet bars, billets and slabs are unchanged at \$32 to \$33, Cleveland.

Warehouse Business.—The volume of orders placed with local jobbers has been only fair, but the tonnage has been well diversified. Quotations are steady and unchanged.

Reinforcing Bars.—Several important jobs are still pending, but there have been no lettings of consequence. Prices are firm, with new billet bars quoted at 1.85c., mill, and rail steel stock at 1.75c., mill.

Old Material.—The market continues in a somewhat buoyant state, largely on account of the liberal amount of material which local steel plants are accepting on current contracts. However, forward buying is negligible. In some cases foundry items are fairly active, but in general the demand for these grades is light. Prices are showing strength, but have not changed.

Prices per gross ton delivered consumers' yards:

Basic Open-Hearth Grades

No. 1 heavy melting steel.....	\$13.00
No. 2 heavy melting steel.....	\$12.25 to 12.50

Rails under 3 ft.....	16.75 to 17.25

Miscellaneous

Railroad malleable.....	15.00 to 15.50
Rails for rolling.....	16.25 to 16.50

Coke.—A flurry in 48-hr. beehive heating coke has carried quotations up to \$2.85, Connellsville, with some few producers asking \$3. Connellsville foundry coke, however, is unchanged at \$3.50 to \$4.85, ovens. Users of by-product foundry coke are accepting moderate tonnages on present contracts. A local maker of by-product domestic coke is maintaining a schedule of \$6, delivered to Cleveland dealers, for egg size.

Wire Products.—Specifications against current contracts have been fairly good and fresh buying is of moderate proportions, although confined to small miscellaneous lots for prompt delivery. In some cases common wire nails are being sold below \$2.55, Pittsburgh, for shipment to users in outlying territories. However, most producers are refusing to accept orders at less than the regular

schedule. Otherwise, quotations are steady.

Sheets.—Bookings in the past week have been slightly better, although specifications from companies allied with the automobile industry are showing the effects of a slackening in production. Fresh buying is almost without exception limited to small tonnages to cover immediate needs. Prices are showing the greatest strength in many weeks, but no changes are reported. Black sheets are quoted at 2.65c., Valley, or 2.60c., Pittsburgh, galvanized at 3.40c., Pittsburgh, or 3.45c., Valley, and blue annealed at 1.90c. to 2c., Pittsburgh,

Strip.—Steel users are placing a fair volume of specifications but new buying is light. Hot-rolled strips are steady at 1.75c., Pittsburgh, for wide material. Producers are quoting 2.65c., Cleveland, on cold-rolled strips for lots of 3 tons or more.

Detroit Scrap Market Dull

DETROIT, Aug. 7.—The market on old material in this district has been very quiet, with no sales involving large tonnage. Prices are the same as last quoted.

German Mills Make 10 Year Contract for Wabana Ore

HAMBURG, GERMANY, July 21.—A 10-year contract for Wabana iron ore has been signed with the British Imperial Production Co., Ltd., by the Vereinigte Stahlwerke A. G., Gutehoffnungshütte, Friedrich Krupp A. G., Mannesmann Tube Co. and the Klockner Co. Under the terms of the contract, which expires in 1938, these German consumers will take 700,000 tons a year for the next three years, increasing to 800,000 tons in 1931, to 950,000 tons in 1932 and 1,150,000 tons in 1933. Of these totals, about 70 per cent will be taken by the Vereinigte Stahlwerke A. G. at Dusseldorf. The price of the ore fixed by the contract is 11s. 3d. (\$2.73) per ton, f.o.b. The British Imperial Production Co. guarantees the ore shipped to be 52 per cent iron content and 0.8 to 1.00 per cent phosphorus.

Australia ranked third in 1927 among the foreign markets of the United States for agricultural implements, according to a study prepared by Trade Commissioner Elmer G. Pauly, Melbourne, and just issued by the Department of Commerce. The growth of American trade in farm machinery during the past 10 years has been striking, the report shows. In 1917 Canada had the bulk of the Australian business in agricultural implements, while for the fiscal year 1926-27 American manufacturers obtained approximately 60 per cent of the Australian import business in these lines and Canada 16 per cent. Some 15 per cent went to the United Kingdom.

San Francisco

Steel Business Expanding Slightly—Pending Structural Steel Projects for 15,000 Tons

SAN FRANCISCO, Aug. 4 (*By Air Mail*).—Movement of steel products on the Pacific Coast is expanding slightly and from present indications bookings for the year will be close to the total of last year. The greatest activity at present is in the market for structural steel shapes and reinforcing bars, some fair-sized lots being placed this week.

The Columbia Steel Corporation, San Francisco, has announced that plans are being prepared for a \$2,500,000 tin plate mill to be erected at its Pittsburgh site with a capacity of 50,000 tons a year. This mill will be the first one to be erected on the Pacific Coast.

Pig Iron.—Bids were opened this week in Washington for 400 tons of iron for the Puget Sound Navy Yard. This is the largest inquiry to come before the trade in many weeks. Sales and inquiries involve only small lots. An importer of foreign material has unloaded 1700 tons of Indian iron, 100 tons of which will be reshipped to north Pacific ports, the rest to be taken by Los Angeles and San Francisco consumers. No changes in quotations are noted.

Prices per gross ton at San Francisco:

*Utah basic		\$25.00 to \$26.00
*Utah fdy., sil.	2.75 to	
3.25		25.00 to 26.00
**Indian fdy., sil.	2.75 to	
3.25		24.00 to 25.00

*Delivered San Francisco.

**Duty paid, f.o.b. cars San Francisco.

Bars.—Outstanding among the awards this week was 2288 tons for Drainage Improvement District No. 26 at Los Angeles, the general contract for which was secured by H. M. Baruch Corporation. The Pacific Coast Steel Co. was low bidder on 589 tons for the Big Dalton dam at Los Angeles and took 200 tons for a garage on Turk Street, San Francisco. New inquiries involve 140 tons for a hotel on Geary Street and 150 tons for an apartment on Green Street, San Francisco. Projects pending call for more than 5000 tons.

Plates.—Inquiries for plates are few and far between. The East Bay Municipal Utility District distributing system in Oakland, involving 7200 tons, bids on which will be opened Aug. 17, is the largest pending project. On Aug. 7 bids will be opened in

Washington for 131 tons of plates for the Mare Island Navy Yard. The General Petroleum Corporation, Los Angeles, is preparing plans for two 40,000 bbl. tanks and bids will be called for within the near future; approximately 400 tons is involved. While 2.25c., c.i.f., is general on desirable tonnages, some business is still going at 2.30c.

Shapes.—Several fair-sized structural awards were placed during the week; the largest was 1000 tons for a headframe, machine shop, hoist house and bins for the Consolidated Copper Co. at Kimberly, Nev., taken by the Kansas City Structural Steel Co. McClintic-Marshall Co. booked 700 tons for a hospital at Orange, Cal., while the Moore Dry Dock Co. took 280 tons of rail steel and shapes for a vault for the United States Mint in San Francisco. New inquiries call for 1200 tons for an apartment in San Francisco and 1100 tons for an office building in Oakland. Pending business now exceeds 15,000 tons. Plain material continues firm at 2.35c., c.i.f.

Cast Iron Pipe.—For the first time this year no awards of over 100 tons of cast iron pipe were reported. New inquiries developing during the week involved small lots only. Bids will be

opened next week on 416 tons for Tracy, Cal., and on 148 tons of 2 and 4-in. class B for Compton, Cal. The largest inquiry calls for 23,247 tons for Dallas, Tex., followed by 22,325 tons for the East Bay Municipal Utility District at Oakland.

Standard Pipe.—Little or no improvement in demand for standard pipe and oil country goods is noticed and the market remains exceptionally quiet. The only award of over 100 tons this week involved 109 tons of 1-in. extra heavy galvanized pipe for Los Angeles, placed with the Santa Fe Pipe & Supply Co.

Coke.—Demand for coke reflects the quiet condition prevailing in the pig iron market. A shipment of 4500 tons of English beehive and by-product coke is scheduled to arrive in port the latter part of the month. Most of this will apply against contracts placed some time ago. English by-product coke ranges from \$11.50 to \$13 a net ton, incoming dock, while beehive coke is quoted at \$16 a net ton.

Warehouse Material.—Some changes in out-of-stock prices in the San Francisco district have been made. No. 24 gage galvanized sheets have been reduced from 5.50c. to 5.40c.; blue annealed sheets, No. 10 gage, have been advanced from 3.90c. to 4c., while No. 24 gage black sheets have been advanced from 4.95c. to 5c. Warehouse interests report movement of stock during July as satisfactory.

Birmingham

Pig Iron Shipments Large and Stocks Are Being Reduced—Steel Demand Satisfactory

BIRMINGHAM, Aug. 7.—Pig iron sales vary little from the average of the past three weeks. The market is largely supported by a number of the smaller melters who prefer hand-to-mouth buying. The greater portion of third quarter iron is under contract. Selling is largely through quiet negotiations and very few inquiries are being received. Shipments have been large for several weeks and stocks in the district have been noticeably reduced. Quotations are unchanged from the \$15.50 base. Furnace operations have been the same for two weeks. Seventeen are in blast, eight on foundry, seven on basic, one on recarburizing iron and one on ferromanganese.

Prices per gross ton f.o.b. Birmingham dist. furnaces:

No. 2 fdy., 1.75 to 2.25 sil.	\$15.50
No. 1 fdy., 2.25 to 2.75 sil.	16.00
Basic	\$15.00 to 16.00

Finished Steel.—An active demand continues and mill schedules are being well sustained. Prices, though unchanged, show more firmness than at any time in the past several months. Sales executives anticipate satisfactory conditions for the remainder of the quarter. Sheets are in greater de-

mand and prices firmer. The amount of overhanging tonnage in the structural steel and reinforcing bar markets is considered fair, but sales have been slow for the past several days. The only structural steel award of any importance is 350 tons booked by the Ingalls Iron Works Co. for the Du Pont Rayon Co. at Old Hickory, Tenn. The five active open-hearth of the Tennessee company is one less than last week. Six continue in operation at Fairfield. The Gulf States Steel Co. is still working three at Alabama City.

Cast Iron Pipe.—The pressure pipe market has been lacking in important bookings for the past month. Miscellaneous orders in small lots have been coming in at a rate sufficient to keep operations up to average. Shipments have been good for several weeks. Soil pipe shops are showing a little more activity. Quotations continue to be made on a base of \$34 to \$35 on 6-in. and larger sizes.

Coke.—The market is still somewhat depressed and sales are light. All by-product plants are still in operation, though some of them are not

Warehouse Prices, f.o.b. San Francisco

Base per Lb.

Plates and struc. shapes		3.15c.

pushing production. Quotations are unchanged from \$5 base for both spot and contract.

Old Material.—The market has experienced a stronger demand during the past two weeks. Iron axle prices have been increased to \$21 to \$22 and No. 1 cast is being quoted at \$14, instead of \$14.25. Other quotations are the same.

Prices per gross ton, deliv'd Birmingham dist. consumers' yards:

Heavy melting steel.....	\$8.50 to	\$9.00
Scrap steel rails.....	11.00 to	11.50
Short shoveling turnings..	7.50 to	8.00

Iron axles	21.00 to	22.00
No. 1 railroad wrought...	10.00 to	10.50
Rails for rolling.		13.00
No. 1 cast		14.00
Tramcar wheels	12.50 to	13.50
Cast iron carwheels.....	12.00 to	13.00
Cast iron borings, chem..	13.50 to	14.00

St. Louis

Slight Improvement in Pig Iron Demand—Scrap Dull and Weak—Sheets Firm

ST. LOUIS, Aug. 7.—Interest in pig iron on the part of consumers has developed moderate improvement. Shipments are holding up well, and requests for expedited delivery of early August contract quotas were reported. Sales were also larger, totaling approximately 7500 tons. Included was 2500 tons of basic, sold by the leading local producer to an East Side mill. Iowa implement dealers took 1800 tons, 500 of which was malleable. A machinery and engine builder in the district proper engaged 600 tons for third quarter shipment. The balance ranged from car lots to 200 tons, and was sold to melters in Missouri, Illinois and Iowa. Some fourth quarter inquiry of a tentative character has appeared.

Prices per gross ton at St. Louis:

No. 2 fdy., sil. 1.75 to 2.25, f.o.b.	
Granite City, Ill.	\$18.50 to \$19.00
N'th'n No. 2 fdy., deliv'd St. Louis.	19.66
Southern No. 2 fdy., deliv'd	19.92
Northern malleable, deliv'd	19.66
Northern basic, deliv'd	19.66

Freight rates: 81c. Granite City to St. Louis; \$2.16 from Chicago; \$4.42 from Birmingham.

Coke.—Aside from a slight quickening in demand for domestic sizes, the coke situation remains unchanged. An advance in its price by a leading Chicago by-product interest has had a tendency to stimulate dealers in this area to cover their requirements. Shipments of foundry coke have diminished since the middle of July, but the movement of industrial coke, particularly to the Northwest and West, holds up well.

Finished Iron and Steel.—Distributors of iron and steel from stock report a somewhat better demand for building materials, notably standard structural shapes for small jobs and reinforcing concrete bars. Ties and bands are in better call from the South, and there has been fair ordering of materials for conditioning and repairing cotton gins and seed mills.

Less than 200 lb.....	50

Call from the oil, lumber and bituminous coal industries continues dull. Sheets are holding their own, the leading district producer being on full production in all sheet departments, including galvanized. Some reordering of tin plates has taken place by canners who underestimated their initial requirements. Numerous building projects are coming to light, but actual lettings are not of impressive proportions.

Old Material.—Scrap iron and steel remain in the depressed state which

has marked the past several weeks or months. Dealers report few new orders. The mills are taking only a few odd lots of specialties for mixing purposes, and gray iron foundries apparently have all the scrap they require at present. Quotable prices are unchanged, but it is doubtful if the figures shown could be realized on most items. In the immediate past there has been a better tone in rolling mill grades, with fair buying by interests specializing in reinforcing concrete material. Despite the depressed status of the market, the railroads continue to market heavily and to ship promptly. Railroad lists include: Baltimore & Ohio, 10,020 tons; Atchison, Topeka & Santa Fe, 7645 tons; Southern Pacific, 2855 tons; Mobile & Ohio, 23 cars; Pullman Co., 4 cars, and Chicago & Eastern Illinois, 10 cars.

Dealers' buying prices, per gross ton, f.o.b. St. Louis district:

Heavy melting steel.....	\$10.50 to	\$11.00

Buffalo

Pending Pig Iron Totals 10,000 Tons—Steel Mills Operating at 80 Per Cent or Better

BUFFALO, Aug. 7.—While there is a lull in pig iron buying, a real improvement in the market is noticeable. The melt has increased and stocks are rapidly dwindling. The heating industry is showing a very satisfactory increase, with resulting growth in consumption of iron. An inquiry from New England is for 5000 to 6000 tons of malleable and total inquiry of 10,000 tons is reported. There has been considerable placing of 100-ton and carload orders, and producers are very optimistic over prospects within the next 30 days. The price of \$17,

base Buffalo, apparently has not been broken on district business in months. Some of the Buffalo furnaces are making steady shipment of iron via the barge canal for storage at New Jersey points against prospective business in the East. The Hanna Furnace Co. will probably blow in another furnace some time this month. The new Hanna stack may go in blast in September. The stack of the Tonawanda Iron Corporation is out for relining and other repairs and will return to blast some time in October. Considerable stock of iron is on hand to tide over the American Radiator Co.'s needs during the interim.

Finished Iron and Steel.—Demand for bars, shapes and plates is fair and operations of mills are around 80 per cent. Sheet prices are steadier, with 2.65c ruling for black sheets and 4c

for automobile body sheets. Sheet mill operations are at 85 to 88 per cent. Warehouse business during July was the best of any month since the beginning of the year. Wire demand is good, though the peak of demand for seasonal products has passed. Reinforcing bar makers are figuring a 375-ton school, and bids are in for the new Lockport, N. Y., filtration plant requiring 1000 tons of reinforcing bars. Plans are about completed for the new 26-story Rand Building.

Old Material.—The market has a slightly better tone, but no new buying of consequence has been done in two weeks. A few small orders for No. 1 machinery cast have been taken at \$14.50 to \$15, and a few similar transactions in steel rails at \$16 to \$16.50 are reported. Stove plate is dull; a consumer is still holding up shipments on sales made a month ago. Most of the larger plants are accepting shipments and the leading consumer continues to receive Detroit scrap by vessel at the rate of about five boatloads per month. This is

principally hydraulic compressed sheets.

Prices per gross ton, f.o.b. Buffalo consumers' plants:

Basic Open-Hearth Grades		
No. 1 heavy melting steel	\$13.50 to	\$14.00
No. 2 heavy melting steel	12.00 to	12.50

Boston

Purchase of 500 Tons of Pig Iron by Providence Melter Brings Out Low Prices

BOSTON, Aug. 7.—Low prices were obtained last week by the Universal Winding Co., Providence, R. I., on 500 tons of No. 2X and an equal amount of No. 1X iron. The business was divided between a Buffalo furnace and one east of Buffalo. The purchase was made on a delivered basis. The No. 2X was sold at a delivered price close to \$20, while the No. 1X was sold at a price that figures back to less than \$16.50 a ton, Buffalo, allowing for low rail and water rates. Sales for the past week totaled approxi-

mately 4200 tons, of which the Mystic Iron Works booked 2200 tons. The remainder included small lots of Buffalo, New York State, western Pennsylvania and Alabama iron. A Springfield, Mass., foundry is asking for bids on 500 tons, another Massachusetts melter on an indefinite tonnage, which may run into five figures, and there are about a half dozen small inquiries; all of them, it is expected, will be closed within a week. One Buffalo interest reports stocks at the furnace as materially smaller than a month ago, but the shrinkage so far has failed to check price cutting by furnaces in that district.

Foundry iron prices per gross ton deliv'd to most New England points:

*Buffalo, sil. 1.75 to 2.25	\$20.91 to \$21.41
*Buffalo, sil. 2.25 to 2.75	21.41 to 21.91
†Buffalo, sil. 1.75 to 2.25	19.78 to 20.28
†Buffalo, sil. 2.25 to 2.75	20.28 to 20.78
East. Penn., sil. 1.75 to 2.25	23.15 to 23.65
East. Penn., sil. 2.25 to 2.75	23.65 to 24.15
Va., sil. 1.75 to 2.25	25.71
Va., sil. 2.25 to 2.75	26.21
Ala., sil. 1.75 to 2.25	22.41 to 24.27
Ala., sil. 2.25 to 2.75	22.91 to 24.77

Freight rates: \$4.91 all rail and \$3.78 rail and water from Buffalo; \$3.65 from eastern Pennsylvania; \$5.21 all rail from Virginia; \$6.91 to \$8.77 from Alabama. *All rail rate. †Rail and water rate.

Coke.—Specifications against last half by-product foundry coke contracts so far this month have been about on a par with those for July. The market is by no means active, however. The price quoted by the New England Coal & Coke Co. and the Providence Gas Co. remains at \$11 a ton, delivered within a \$3.10 freight rate zone. Small tonnages of Connelville and New Jersey coke are

being sold in New England. The market for domestic fuel is rather flat.

Cast Iron Pipe.—The Warren Foundry & Pipe Co. has sold 100 tons of 6-in. pipe to the West Groton water district, West Groton, Mass., and 100 tons of 16-in. class C cement-lined pipe to Revere, Mass. The United States Cast Iron Pipe & Foundry Co. has sold 100 tons of 12-in. pipe to Lowell, Mass. No other municipal business has been closed, but private purchases are much larger than usual at this time of the year. Utility companies are taking good tonnages privately, including 20-in. and 30-in. pipe, and one is now negotiating for a fair-sized export tonnage. It is reported that Milford, Mass., has closed on 150 tons of 8-in. pipe, but details are lacking. The indications are the 19,000 ft. of 30-in. pipe for Massachusetts, under contract with the C. & R. Construction Co., will be steel instead of cast iron pipe. Most foundries are holding small pipe prices firmly, but one is making concessions. There is general price shading on large pipe. The range on 4-in. pipe is \$45.10 to \$46.10 a ton, delivered common Boston freight rate points, and on 6-in. to 12-in., \$41.10 to \$42.10. The usual \$5 differential is asked on class A and gas pipe.

Old Material.—The movement of old material out of New England in the past week was less than for any previous week this year. At prices offered by mills shippers cannot get their money back on any material that has to pass through yards. Activity centers in scrap for export, domestic trade being confined principally to machine shop turnings, machinery and textile cast. The demand for textile and machinery cast, however, is spotty. One New England consumer continues to take long bundled skeleton at \$6.50 to \$7 a ton, on cars shipping point. Prices on that material for Pennsylvania consumption are lower.

Buying prices per gross ton, f.o.b. Boston rate shipping points:

No. 1 heavy melting steel	\$8.00 to \$8.50
Scrap T rails	7.50 to 8.00
Scrap girder rails	7.25 to 7.50
No. 1 railroad wrought	8.50 to 9.00
No. 1 yard wrought	7.00 to 7.50
Machine shop turnings	5.00 to 5.50
Cast iron borings (steel works and rolling mill)	5.00 to 5.50
Bundled skeleton, long	6.50 to 7.00
Forge flashings	6.50 to 7.00
Blast furnace borings and turnings	5.00 to 5.50
Forge scrap	5.50 to 6.00
Shafting	11.50 to 12.00
Steel car axles	14.50 to 15.00
Wrought pipe 1 in. in diameter (over 2 ft. long)	7.00 to 7.50
Rails for rolling	9.50 to 10.00
Cast iron borings, chemical	9.50 to 10.00

Prices per gross ton deliv'd consumers' yards:

Textile cast	\$13.50 to \$14.00
No. 1 machinery cast	14.00 to 14.50
No. 2 machinery cast	12.50 to 13.50
Stove plate	10.00 to 10.50
Railroad malleable	13.50 to 14.50

The Pittsburgh Steel Co. has bought four 1400-hp. powdered coal fired Ladd boilers for its new power plant at Monessen, Pa.; the Pressed Steel Car Co., two 600-hp. powdered coal fired Heine boilers for its Chicago works and the Weirton Steel Co. a 900-hp. waste heat Heine boiler from the International Combustion Corporation.

Canada

Pig Iron Sales Decline Slightly—30,000 Tons in Prospective Structural Steel Contracts

TORONTO, ONT., Aug. 7.—Foundry and malleable pig iron sales in the Canadian markets have shown a slight decline. The daily melt, however, is holding at the former high level, and the slump in business is chiefly due to the fact that spot buyers are covered for the present and no advance buying is being done. July sales compared favorably with those of other months this year. Production of pig iron in Canada continues at a high rate, with eight blast furnaces blowing. Price shading is reported in the Montreal district.

Prices per gross ton:

Delivered Toronto	
No. 1 fdy., sil. 2.25 to 2.75.	\$23.10 to \$23.60
No. 2 fdy., sil. 1.75 to 2.25.	23.10 to 23.60

Basic	23.50 to 24.00
Imported Iron, Montreal Warehouse	
Summerlee	33.50
Carron	33.00

Structural Steel.—While no large tonnage contracts featured business in this market during the week, fabricators report a steady flow of small orders. For the Industrial Alcohol Co.'s plant addition at Corbyville, Ont., 800 tons of structural steel and 300 tons of reinforcing bars were placed; 400 tons of structural steel has been ordered for the addition to

the plant of the American Pad & Textile Co., Chatham, Ont. A few small tonnages were closed. Prospective business involves about 35,000 tons of structural steel.

Old Material.—A general slump in business has occurred in both Toronto and Montreal markets during the past week or 10 days. Consumers are showing little interest and are ordering supplies only when demands dictate. Current sales, few in number, are confined to small tonnages. Trading between dealers has also declined. Prices are showing a softening tendency in the Toronto district, but revisions have not been made in dealers' buying price lists.

Dealers' buying prices:

	Per Gross Ton

Cincinnati

Pig Iron Market Dull, But Scrap Market Shows Signs of Recovery

CINCINNATI, Aug. 7.—The pig iron market is still rather dull. The Marmion Motor Co. inquiry for 3200 tons of Northern iron is yet under consideration, with belief that it will be closed within the week. The Hooven, Owens, Rentschler inquiry is now reported as covered. It was for 5000 tons and went to a Northern furnace. A local distributor reports sales of two lots of silvery iron, 300 tons and 250 tons, respectively, with about 650 tons of Northern foundry iron. Another sale of 300 tons of malleable was reported, and around 200 tons of Northern iron. Sales of smaller lots down to carloads were fairly numerous.

Prices per gross ton, deliv'd Cincinnati:

So. Ohio fdy., sil. 1.75 to 2.25	\$19.89
So. Ohio malleable.....	\$20.14 to 20.89
Ala. fdy., sil. 1.75 to 2.25	19.19
Ala. fdy., sil. 2.25 to 2.75	19.69
Tenn. fdy., sil. 1.75 to 2.25	19.19
So'th'n Ohio silvery 8 per cent	26.89

Freight rates, \$1.89 from Ironton and Jackson, Ohio; \$3.69 from Birmingham.

Old Material.—The scrap market has developed somewhat from its sluggish condition and some prices have

strengthened. Light inquiry has brought some sales at current prices and better. Dealers are loath to sell in large lots at present prices and this has brought higher bids from concerns seeking to buy. Most dealers are adding 25c. to 50c. to current quotations. Small orders have been received in car lots to 1000 tons, but dealers hesitate to sell on a market that is beginning to show signs of life.

Dealers' buying prices per gross ton, f.o.b. cars, Cincinnati:

Heavy melting steel.....	\$10.75 to \$11.25
Scrap rails for melting....	10.75 to 11.25
Loose sheet clippings.....	8.25 to 8.75
Bundled sheets	9.00 to 9.50
Cast iron borings.....	8.00 to 8.25
Machine shop turnings....	7.25 to 7.75
No. 1 busheling.....	10.00 to 10.50
No. 2 busheling.....	6.00 to 6.50
Rails for rolling.....	12.50 to 13.00
No. 1 locomotive tires....	12.75 to 13.25
No. 1 railroad wrought...	10.00 to 10.50
Short rails	15.75 to 16.25
Cast iron carwheels.....	11.00 to 11.50
No. 1 machinery cast....	15.00 to 15.50
No. 1 railroad cast.....	12.75 to 13.25
Burnt cast	7.50 to 8.00
Stove plate	8.25 to 8.75
Brake shoes	9.50 to 10.25
Railroad malleable	11.50 to 12.00
Agricultural malleable ...	10.50 to 11.00

REINFORCING STEEL

EXCEPT for a drainage improvement project at Los Angeles which took 2300 tons, the total of 6800 tons of reinforcing steel reported placed in the last week was principally in small tonnages. Inquiries, amounting to 3550 tons, included 1000 tons for a water filtration plant at Lockport, N. Y. Awards follow:

- PORT NEWARK, N. J., 150 tons, terminal improvement work, to Concrete Steel Co.
- HARRISON, N. J., 150 tons, factory building for Otis Elevator Co., to Igoe Brothers.
- NEW BRUNSWICK, N. J., 150 tons, building for Reichart Cocoa & Chocolate Co., to E. T. Edwards, Columbia, Pa.
- PITTSBURGH, 100 tons, Boulevard of the Allies, to Electric Welding Co.
- EVANSTON, ILL., 174 tons of rail steel bars, apartment building, to Barton Spiderweb System, Inc.
- CHICAGO, 277 tons, factory building, to Barton Spiderweb System, Inc.
- CHICAGO, 475 tons, apartment hotel at 6240 Sheridan Road, to Barton Spiderweb System, Inc.
- CHICAGO, 200 tons rail steel bars, apartment building at East Seventy-third Street and Lake Michigan Drive, to Calumet Steel Co.
- CHICAGO, 600 tons of rail steel bars, garage to Barton Spiderweb System, Inc.
- CHICAGO, 160 tons, public school building, from A. and E. Anderson, to Barton Spiderweb System, Inc.
- CHICAGO, 390 tons, two public school buildings, to Concrete Engineering Co.
- CHICAGO, 500 tons of rail steel bars, caissons for Mercantile Mart, to Inland Steel Co.; formerly reported as 200 tons.
- CHICAGO, 250 tons rail steel bars, garage at State and Eleventh Streets, to Calumet Steel Co.
- STATE OF ILLINOIS, 400 tons of rail steel bars, road work, to Calumet Steel Co.
- EVERETT, WASH., 275 tons, department store, to Pacific Coast Steel Co.
- SEATTLE, 130 tons, Grimshaw garage, to Northwest Steel Rolling Mills.
- LOS ANGELES, 2288 tons, Drainage Improvement District No. 26, to H. M. Baruch Corporation.
- SAN FRANCISCO, 200 tons, garage, Jones and Turk Streets, to Pacific Coast Steel Co.
- SAN FRANCISCO, 121 tons, bakery, Alameda and Bryant Streets, to Gunn, Carle & Co.

- Reinforcing Bars Pending**
- BOSTON, Charlestown district, 500 tons, H. P. Hood & Sons milk plant.
 - NEW YORK, 600 tons, warehouse for Western Union Telegraph Co.
 - NEW YORK, 350 tons, sewer work in Queens; Necaro Construction Co., general contractor.
 - ROCKAWAY BEACH, N. Y., 325 tons, boardwalk; Montrose Contracting Co., general contractor.
 - JONES BEACH, N. Y., 850 tons, causeway; C. H. Earle, general contractor.
 - KEARNY, N. J., 300 tons, buildings 51 and 52 for Western Electric Co.
 - BUFFALO, 150 to 375 tons, school No. 80; being figured.
 - LOCKPORT, N. Y., 1000 tons, city filtration plant; bids in.
 - GALESBURG, ILL., 190 tons, reservoir.
 - SAN FRANCISCO, 140 tons, hotel, Geary and Maggie Streets; bids being taken.
 - VENTURA, CAL., 118 tons, Bardsdale bridge, general contract to Claude Fisher, Los Angeles.

July Exceeds June in Ingot Production

Compared with July, 1927, It Is Up 19 Per Cent—Gain of Seven Months Over 1927 Nearly 1,600,000 Tons

PRODUCTION in July of open-hearth and Bessemer steel ingots in the United States, as indicated by the returns made to the American Iron and Steel Institute, was nearly 2 per cent more than in June, whereas a

year ago the July output fell off over 8 per cent from that of June. Counting out July 4 and the five Sundays, July is regarded as having 25 full working days, as was the case for July, 1927. On the basis of working

days, as shown in the accompanying table, the July output of 152,463 tons a day was nearly 6 per cent better than the daily rate of June and 19 per cent ahead of the daily rate of July, 1927. July of last year showed an average daily recession of 4½ per cent from June, comparing with the 6 per cent expansion this year.

The indicated total for seven months, 28,604,000 tons, is 1,592,934 tons ahead of the seven months of 1927, or practically 6 per cent.

Mining Engineers Active

Will Inspect Iron Mining at Wabana and Menominee—Metals and Petroleum Also to Be Discussed

NO less than six meetings will be held this fall by various sections of the American Institute of Mining and Metallurgical Engineers. These will replace the usual fall meeting which has been held for many years past, wherein all the members of the institute were invited to inspect some interesting region distant from headquarters.

The first gathering this year will assemble at the Copley-Plaza Hotel, Boston, Wednesday, Aug. 29, for a three-day discussion of geophysics, the scientific equivalent of the dowsing rod or water finder. On Sept. 1 the party will leave for a two-weeks' tour of Newfoundland and Nova Scotia, going by steamer and returning by rail. Visits will be made to the great Wabana iron mines, the new Buchans mine, the submarine coal mines at Glace Bay, the Steel Works at Sydney, the Malagash salt mine, and one of the famous gold mines of Nova Scotia.

Assembling at Crystal Inn, Crystal Falls, Mich., the newly organized Iron and Steel Division will inspect the Menominee Range on Sept. 7 and 8. This will be a joint meeting with the Lake Superior Mining Institute. Visits will be made to mines in the vicinity of Alpha, Caspion, Iron River and Iron Mountain. Complete details have been given in THE IRON AGE, July 26, page 254.

Sept. 10 to 15 (the week of the Steel Treaters' Show on the Pacific Coast), the Southern California section will meet at the Biltmore Hotel, Los Angeles, Cal. Discussions will be conducted on mining, milling, flotation, smelting and refining of gold, copper and zinc ores.

Institute of Metals Division will meet with the American Society for Steel Treating during the International Steel Exposition in Philadelphia.

Headquarters will be at the Benjamin Franklin Hotel. Titles of the papers so far promised were printed in THE IRON AGE, July 26, page 254.

A fall meeting of the Petroleum Division will be held at Tulsa, Okla., on Oct. 18 and 19. Reduced fares to that point may be had, since the International Petroleum Exposition will convene immediately thereafter. Papers will be devoted to the engineering problems of oil production.

July Ore Shipments Larger—Year's Total Lower

Iron ore shipments from the Lake Superior region amounted to 8,980,859 tons in July, an increase of 371,777 tons or 4.32 per cent above the 8,609,082 tons shipped from upper Lake ports in July, 1927. The total

for the season to Aug. 1 declined 3,104,521 tons or 11.77 per cent, compared with the 26,380,505 tons shipped to Aug. 1, 1927. The table gives in detail the shipments for July and for the season in 1928 and 1927 in gross tons.

Bureau of Standards Consolidates Publications

In the past the Bureau of Standards has issued the results of its scientific papers in two series of volumes, namely, "Scientific Papers" and "Technologic Papers." To date each of these publications has run to 22 volumes and the total comprises some 942 research papers.

Commencing with July, however, the two series will be consolidated in a single magazine, issued monthly and entitled "Bureau of Standards Journal of Research." The union of pure and applied science in one journal will, it is believed, tend to bridge the gap between the two fields, and by so much shorten the lag between discovery and its application.

The subscription price is \$2.75 per year, and remittances should be made direct to the Superintendent of Documents, Government Printing Office, Washington.

Non-Ferrous Metal Markets

Copper Quiet But Firm, Tin Sales Large, Lead Slightly Easier, Zinc Active and Higher.

Copper.—More interest in September copper is being shown by domestic consumers this week and a fair amount of business has been placed, sales Monday and Tuesday being quite satisfactory. One large consumer is reported to have placed fairly liberal orders. It is estimated that about one-third of the September requirements of domestic users has been contracted for. Quotations continue unchanged and very firm at 14.75c., delivered in the Connecticut Valley, with

THE WEEK'S PRICES. CENTS PER POUND FOR EARLY DELIVERY

*Refinery quotation; delivered price ¼c. higher.

14.87½c. the price in the Middle West. Lake copper is fairly active with sales being made for October delivery and with quotations unchanged at 14.75c. to 14.87½c., delivered. Demand from abroad continues in moderate volume, all business being done at 15c., c.i.f. European ports, a quotation which was established May 25. Purchases are estimated at about 1000 tons a day thus far this month.

Tin.—Because of a bank holiday in London yesterday, Monday, and the closing of that market also on Saturday, consumers came into the market on Friday and during the week, making fairly liberal purchases and bringing the total for the week to about 1500 tons. These transactions cov-

ered spot and August delivery, showing decidedly that consumers have allowed their stocks to dwindle and are buying from hand to mouth. Disappointment was aroused by the American deliveries into consumption of only 5545 tons during July. This is explained as caused by the large amount of metal left on dock. With large supplies of spot metal, it appears strange that nearby positions should demand the premiums they do. The fact that 400 tons was sold Tuesday at Singapore is regarded as significant in reflecting large supplies of the metal. On Monday the market was dull and uninteresting owing to the holiday in London and Tuesday the market was also quiet with spot Straits tin quoted at 47.87½c., New York.

Prices at London today were as follows: Spot standard, £213 7s. 6d.; future standard, £211 17s. 6d. and spot Straits £215 17s. 6d. The Singapore price today was £216. Arrivals thus far this month have been only 410 tons with 6241 tons reported afloat.

Lead.—With the exception of a slightly easier situation in the West, prices are fairly firm. Sales of spot and August metal have been made at St. Louis at 5.97½c. to 6c. In the East, quotations continue firm and unchanged at 6.20c., New York, this being the contract price of the leading interest. Cable makers are reported as the heaviest buyers, but a fair amount of business is being done in other directions. One authority points out that so far this year business is reported larger than for the same period a year ago.

Zinc.—Galvanizers have been fairly liberal buyers the past week and sales in other directions are reported as satisfactory. The trend in prices has been gradually upward for some time and yesterday (Monday) a higher level was established at 6.25c., St. Louis, or 6.60c., New York, an advance of five points. One important factor is the information which producers are now obtaining from the American Zinc Institute as to the condition of forward orders. This is similar to information which copper producers have been obtaining for some time. The effect is to strengthen, or at least to more wisely guide, producers. Ore prices at Joplin were unchanged at \$40 last week. Sales are given as about 10,000 tons with production about 12,500 tons and shipments 11,500 tons. Stocks are reported as approximately 37,000 tons. The continued high production of ore is commented upon rather unfavorably.

Antimony.—Chinese metal is unchanged at 10c. for spot and 10.25c., for futures, duty paid, New York. The Chinese market is higher today, futures being quoted at 10.37½c.

Nickel.—Quotations are unchanged for wholesale lots of ingot nickel at 35c., with shot nickel at 36c. and for electrolytic nickel at 37c.

Aluminum.—Virgin metal, 98 to 99 per cent pure, continues at 23.90c., delivered.

Non-Ferrous Metals at Chicago

CHICAGO, Aug. 7.—Sales are spotty but larger in total volume than a week ago. Prices for copper and zinc are advanced. The old metal market is quiet.

Prices, per lb., in carload lots: Lake copper, 15.25c.; tin, 49c.; lead, 6.10c.; zinc, 6.40c.; in less-than-carload lots, antimony, 11c. On old metals we quote copper wire, crucible shapes and copper clips, 10.75c.; copper bottoms, 9.75c.; red brass, 9.50c.; yellow brass, 7.25c.; lead pipe, 4.75c.; zinc, 3.50c.; pewter, No. 1, 30c.; tin foil, 36.25c.; block tin, 45.25c.; aluminum, 12c.; all being dealers' prices for less-than-carload lots.

Railroad Equipment

Pennsylvania Orders 550 Steel Refrigerator Cars—Great Northern Will Buy 2500 Cars and 2000 Underframes

AN order for 550 all-steel express refrigerator cars for the Pennsylvania and an inquiry from the Great Northern for 2500 freight cars and 2000 underframes made the past week one of the most active of summer in the railroad equipment market. Other transactions of the week, details of which follow, were mostly of a minor nature:

Pennsylvania Railroad has ordered 200 all-steel passenger train refrigerator cars from American Car & Foundry Co., 200 from Pressed Steel Car Co., 100 from Pullman Car & Mfg. Corporation and 50 from General American Car Co.

Great Northern Equipment Co. is receiving bids on 500 50-ft. box cars, 500 52-ft. flat cars, 500 40-ft. coal cars, 1000

all-steel ore cars and 2000 steel underframes for box cars.

United States Navy Department has ordered two gondola cars from Pressed Steel Car Co.

Chicago, Burlington & Quincy will build 33 steel suburban passenger cars at its Aurora, Ill., shops.

Nevada Consolidated Copper Co. will buy 20 Ingoldsby-type ore cars of 60 tons capacity.

Lehigh & New England has ordered three steel underframe caboose cars from Pressed Steel Car Co.

International Railways of Central America have ordered two Mikado type locomotives from Baldwin Locomotive Works.

Manila Railroad, P. I., has ordered four three-cylinder Mikado type locomotives from Baldwin Locomotive Works.

To Design Steel Plant for Siberia

Chicago Engineers to Lay Out Soviet Project for Making Rails, Shapes, Bars and Plates

CHICAGO, Aug. 4.—The following dispatch was cabled by the Chicago *Daily News* correspondent in Moscow, John Gunther.

"H. J. Freyn, president Freyn Engineering Co., Chicago, left Moscow today with four of his engineers, after having completed negotiations for the construction of a new iron and steel plant at Kuznetsk, Siberia. As approved by the State Institution for the Projection of New Metal Works, the Soviet body charged with such engineering concessions, the projects call for a plant capable of producing initially 400,000 tons of rails, structural steel, bars and plates annually. This will be one of the largest factories in Siberia.

"Mr. Freyn said that the plant will be designed by his firm on entirely American lines, making full utilization of American practical experience and equipment. During his stay here Mr. Freyn also completed negotiations for the extension of his original contract of May, 1927, whereby technical assistance is accorded for five years to the Russian iron and steel industry. The present amplification agreements calls for a special Russian department of the Freyn Engineering Co. to be stationed at Leningrad. This establishment is to be on a permanent basis as a component part of the state institution for projecting new metal works. 'This agreement authorizes consultation with us on all problems connected with the iron and steel industry throughout Russia, the preparation and construction of drawings and the supervision of field construction of new and on remodeled iron and steel plants' Mr. Freyn said. He added that his relations with both the government officials and the engineers

were harmonious and effective. 'Since the Donetz trial (of coal mine officials and employees charged with subversive sabotage) the tendency is increasing to trust and cooperate with American engineers' said Mr. Freyn."

Reduced Cash Discount Generally Adopted

Manufacturers of sheet steel and cold-rolled strips have generally followed the lead of the American Rolling Mill Co. in reducing the discount for cash in 10 days on those products from 2 per cent to one-half of 1 per cent, effective from Oct. 1, next. Not a few manufacturers have adopted the practice of attaching this announcement as a rider to current invoices as a means of informing customers of the change.

Some doubt exists as to whether tin mill black plate will be affected by the change in the cash discount, because no definite announcement yet has been made. It is believed, however, that all sheet, tin and strip mill products will go to one-half of 1 per cent for cash in 10 days, and some go so far as to say that eventually all products of the industry will take that discount.

Announcement has been made that hoop steel, which has been sold at 1 per cent off in 10 days, as of Oct. 1, goes to one-half of 1 per cent discount for cash. A change in the cash discount on wire products from 2 per cent in 10 days and net in 60 days probably would encounter some difficulty, since mill distribution goes down through jobbers and retailers and nearer to ultimate consumers than other steel products.

Fabricated Structural Steel

Mississippi River Barges Will Take 11,000 Tons—New Projects Bulk Large While Awards Are Light

WITH 11,000 tons needed for 98 barges for the Mississippi River Commission and 6300 tons for a railroad bridge over Newark Bay, new projects totaled 52,000 tons. Five buildings in Chicago will require from 2000 to 2500 tons each, and two bridges elsewhere will take 4000 tons each. Of the following awards, which amount to 22,500 tons, the largest is 4000 tons for several railroad bridges for the Cleveland Union Terminals Co.

DURHAM, N. H., 250 tons, chemical building, to Eastern Bridge & Structural Co.
BOSTON, 155 tons, administration building for Simmons College, to New England Structural Co.
SPRINGFIELD, MASS., 600 tons, transmission towers for New England Power Construction Co., to American Bridge Co.

HARTFORD, CONN., 800 tons, Horace Bushnell Memorial Hall, to an unnamed fabricator.

NEW YORK, 2700 tons, Seward Park High School, to American Bridge Co.

BROOKLYN, 2500 tons, Samuel Tilden High School, to Bethlehem Fabricators, Inc.
WEHAWKEN, N. J., 1000 tons, ferry slips and bridges for New York, Ontario & Western Railroad, to Belmont Iron Works.

PHILADELPHIA, 118 tons, Ashdale Street highway bridge, to Phoenix Bridge Co.
AMBRIDGE, PA., 425 tons, two schools, Harmony school district and Ambridge Borough, to American Bridge Co.

DURHAM, N. C., 550 tons, buildings for Duke University, to Virginia Bridge & Iron Co.

SOUTHERN RAILWAY, 550 tons, bridge at Lumber City, Ga., to Virginia Bridge & Iron Co.

BUFFALO, 1000 tons, new telephone building, to Lackawanna Steel Construction Co.

NASHVILLE, TENN., 350 tons, for Du Pont Rayon Co., to Ingalls Iron Works Co.
FORT MYERS, FLA., 125 tons, bridge, to Ingalls Iron Works Co.

BEAUMONT, TEX., 200 tons, additions to junior high schools, to Orange Car & Steel Co., Orange, Tex.

CLEVELAND, 4000 tons, bridges for New York Central and Nickel Plate railroads, let by Union Terminals Co. to McClintic-Marshall Co.

MUNCIE, IND., 500 tons, school, to Indiana Bridge Co., local.

EVANSTON, ILL., 105 tons, high school, to Wendnagel & Co., Chicago.

CHICAGO, 130 tons, coal trestle for Blackstone Avenue power plant, to Midland Structural Steel Co., local.

CHICAGO, 830 tons, public school, to Vanderkloot Steel Works, local.

CHICAGO, 126 tons, building for American Forge Co., to Gage Structural Steel Co., local.

CHICAGO, 480 tons, McCrory store, to McClintic-Marshall Co.

STATE OF ILLINOIS, 300 tons, five highway bridges, to Continental Bridge Co., Chicago.

ST. LOUIS, 1000 tons, building for Century Electric Co., to Mississippi Valley Structural Steel Co.

TOPEKA, KAN., 1000 tons, viaduct for Santa Fe Railroad, to American Bridge Co.

OKLAHOMA CITY, OKLA., 600 tons, bridge, to McClintic-Marshall Co.

KIMBERLY, NEV., 1000 tons, head frame, hoist house, machine shop and bins for Consolidated Copper Co., to Kansas City Structural Steel Co.

DARRINGTON, WASH., 100 tons, bridge repairs for Northern Pacific, to Pacific Car & Foundry Co.

ORANGE, CAL., 700 tons, hospital, to McClintic-Marshall Co.

SAN FRANCISCO, 280 tons, 200 tons of rail steel and 80 tons of shapes for vault for United States Mint, to Moore Dry Dock Co.

Structural Projects Pending

Inquiries for fabricated steel work include the following:

WORCESTER, MASS., 1500 tons, telephone building.

QUINCY, MASS., 410 tons, stores and offices.

BOSTON, Brighton district, 188 tons, theater.

BOSTON, 127 tons, alterations at 352 Boylston Street.

BOSTON, 119 tons, George White fund health unit No. 4.

FALL RIVER, MASS., 129 tons, bank.

NEW HAVEN, CONN., 300 tons, high school.

NEW YORK, 400 tons, bakery for Dugan Brothers, Inc.

NEWARK, N. J., 6300 tons, approach spans for bridge over Newark Bay for Pennsylvania and Lehigh Valley railroads.

ERIE RAILROAD, 750 tons, 450 tons for bridge at Youngstown, Ohio, and 300 tons for bridge at Rutherford, N. J.

PENNSYLVANIA RAILROAD, 200 tons, bridge at Hinsdale, N. Y.

TOLEDO, OHIO, 4000 tons, bridge over Maumee River for Toledo Terminal Railway Co.

PENNSYLVANIA RAILROAD, 900 tons, four bridges.

COVINGTON, VA., 1500 tons, manufacturing buildings for Industrial Rayon Co.; bids closed Aug. 6.

PITTSBURGH, 1750 tons, 10 barges and three fuel scows for Union Barge Line.

MEMPHIS, TENN., 11,000 tons, 98 barges for Mississippi River Commission; bids to be opened Aug. 17.

ST. PETERS, IND., 1000 tons, highway bridge; Vincennes Bridge Co., low bidder.

MILWAUKEE, 2000 tons, building for Milwaukee Gas, Light & Coke Co.

TEXAS & PACIFIC RAILROAD, 4000 tons, bridges.

CHICAGO, 500 tons, two lift bridges.

CHICAGO, tonnage to be estimated, 45-story office building at 1 North La Salle Street.

CHICAGO, 2500 tons, mill building for United States Gypsum Co.

CHICAGO, 2000 tons, Thompson Building.

CHICAGO, 2000 tons, Ruboff Garage.

CHICAGO, 2500 tons, extension to Wacker Drive.

CHICAGO, 2500 tons, McCormick Estate buildings.

CHICAGO, 450 tons, junior high school; Hansell-Elcock Co., low bidder.

MINNEAPOLIS, tonnage not stated, 24-story office building.

CHICAGO, MILWAUKEE, ST. PAUL & PACIFIC, 700 tons, two bridges.

OAKLAND, CAL., 1100 tons, office building at Fourteenth and Franklin Streets; bids being taken.

SAN FRANCISCO, 1200 tons, apartment building at Green and Leavenworth Streets; bids being taken.

DENVER, COLO., 103 tons of plates for pipe line for Bell Fourche project for United States Bureau of Reclamation in South Dakota; bids opened.

Machine Tool Exposition

To Be Held at Cleveland, Sept. 30 to Oct. 4, 1929—
Order of Preference of Exhibits

The National Machine Tool Builders' Association has announced that its next national machine tool exposition will be held Sept. 30 to Oct. 4, 1929, at the Public Auditorium in Cleveland, where the first exposition took place in 1927. An exposition committee, headed by J. Wallace Carrel, Lodge & Shipley Machine Tool Co., Cincinnati, is already functioning. Other members of this committee are: Henry Buker, Brown & Sharpe Mfg. Co., Providence, R. I.; Ralph E. Flanders, Jones & Lamson Machine Co., Springfield, Vt.; Robert M. Gaylord, Ingersoll Milling Machine Co., Rockford, Ill., and James E. Gleason, Gleason Works, Rochester, N. Y., with P. E. Bliss of Warner & Swasey Co., Cleveland, president of the association, and Ernest F. Du Brul, general manager of the association, as ex-officio participants in the committee's work.

The order of preference by which exhibits will be admitted to the show has been established as follows: 1, Machine tool exhibits by members of the association; 2, machine tool

exhibits by non-members; 3, trade press and manufacturers of accessories used exclusively on machine tools; 4, components and supplies not used exclusively on machine tools, such as anti-friction bearings, driving devices and shop supplies.

Allotments of display space and kindred matters will be handled at the association office, 630 Vine Street, Cincinnati, while details of exposition preparation and management will be taken care of by Roberts Everett, 225 West Thirty-fourth Street, New York.

Class I railroads, on July 15, had 151,886 freight cars in need of repair or 6.7 per cent of the number on line, according to reports just filed with the Car Service Division of the American Railway Association. This was an increase of 6676 over the number reported on July 1, at which time there were 145,210 or 6.5 per cent. Freight cars in need of heavy repairs on July 15, totaled 108,229 or 4.8 per cent, an increase of 964 compared with July 1.

PERSONAL

PRESLEY HAMILTON has been appointed district sales representative in charge of an office which has recently been established at 149 Broadway, New York, by Gears & Forgings, Inc., Cleveland. He has been located in the New York territory for

PRESLEY HAMILTON

the last 10 years and is well known among the manufacturing establishments which the company serves. Gears & Forgings, Inc., was established early this year by a merger of the Van Dorn & Dutton Co. and the Ohio Forge Co., Cleveland; the Fawcuss Machine Co., Pittsburgh, and the William Ganschow Co., Chicago.

HENRY S. BAKER has been appointed manager of cold rolled strip sales for the Sharon Steel Hoop Co., Sharon, Pa.

DAVID W. DUFFIELD, educational director of the Yawman & Erbe Mfg. Co., Rochester, N. Y., will address the Rochester Sales Managers Club on Aug. 24 at the noonday luncheon in the Chamber of Commerce Building.

GRANT THORN has resigned as sales manager of the American Cyanamid Co. to become associated with the subsidiaries of the International Combustion Engineering Corporation which are identified with coal tar products and allied chemical fields.

W. A. READY has been made president of the Ames Shovel & Tool Co., North Easton, Mass., to succeed ALFRED C. HOWELL. ALBERT H. DAGGETT is treasurer of the company, and L. J. REAY assistant treasurer, while N. T. JACOBS is manager of sales. Otherwise the personnel of the company remains practically as before. Mr. Ready is also president of a company engaged in the manufacture of radio goods, with a plant in Malden,

Mass. Mr. Daggett, heretofore connected with the financing department of Stone & Webster, Inc., Boston, has resigned his position there. Mr. Reay was previously associated with Stone & Webster, Inc., at Seattle, Wash. The Boston offices of the Ames company, for years located in the Ames Building, have been moved to North Easton. The company plans soon to start construction on new manufacturing units at North Easton.

JOSEPH A. ASHWELL, formerly purchasing agent of the American Bosch Magneto Co., Springfield, Mass., has been made purchasing agent of the New Departure Mfg. Co., Bristol, Conn., to succeed William A. Kimball, who recently resigned to engage in manufacturing at Newtown, Conn.

EDWARD P. ALLIS, III, vice-president Louis Allis Co., Milwaukee, manufacturer of electric motors, won the Wisconsin state amateur golf championship at Maple Bluff Country Club, Madison, Wis., on Aug. 3, for the ninth time.

PAUL MACKALL has been appointed vice-president in charge of sales of Bethlehem Steel Co., succeeding E. S. KNISELY, who becomes assistant to Mr. Mackall. H. G. WALTON, who was assistant general sales manager, succeeds Mr. Mackall as general sales manager. These changes were announced by President E. G. GRACE on Aug. 1 and took effect from that date. Other changes announced by the Bethlehem company in the structural and plate sales organization are as follows: V. A. JEVON, who has had charge of structural sales in the Pittsburgh district since 1919, has been appointed manager of structural and plate sales at Chicago, succeeding LEE HILLARD, who has been assigned to other duties. A. G. WILLIAMS, formerly sales agent in the Bethlehem district, succeeds Mr. Jevon as structural sales agent at Pittsburgh. ALFRED B. SCOTT succeeds Mr. Williams as structural sales agent in the Bethlehem district.

H. E. LEWIS, executive vice-president Bethlehem Steel Co., sailed July 28 on the Majestic for a European trip. He will be away five or six weeks.

RUDOLPH B. FLERSHEM, vice-president of the Marine Trust Co., Buffalo, and formerly vice-president of the American Radiator Co., has been elected chairman of the executive committee of the National Radiator Corporation, and GRANT PIERCE, who has been in charge of the New England territory of the American company, has been named president of the National corporation.

JOSEPH BECKER, for some time vice-president and consulting engineer for the Koppers Construction Co., Pittsburgh, has been made vice-president and general manager of the company. After several years in the laboratories of Dr. Koppers at Essen, Germany, Mr. Becker came to the United States, and since 1910 has been associated with all installations of Koppers ovens in the United States and Canada. He is the inventor of the type of oven bearing his name.

E. J. KEARNEY of the Kearney & Trecker Corporation, Milwaukee, who has been on a European tour, will return Aug. 11 on the Aquitania.

W. E. GRIFFITHS, for a number of years research metallurgist for the Union Carbide & Carbon Research Laboratories, Long Island City, N. Y., has become associated with the Duraloy Co., Pittsburgh, as research metallurgist.

DR. ROBERT J. ANDERSON, who was recently made vice-president in charge of production for the Fairmont Mfg. Co., Fairmont, W. Va., sailed on the Aquitania, Aug. 1, for an extended business trip abroad.

MORTON H. SMITH, president Morton B. Smith Co., 241 Front Street, New York, which is said to be the oldest non-ferrous metal scrap concern in the United States, will retire from active business as soon as the company's warehouses are sold. J. W. STRAUB, vice-president, will continue some of the lines in which the company has been engaged, but without a warehouse. Mr. Straub will be located temporarily at 241 Front Street. The business of Morton B. Smith Co. was established in 1847 by William D. Andrews, the inventor of the centrifugal pump. Morton B. Smith, father of Morton H. Smith, became associated with Mr. Andrews in 1859. After various changes in name, the company became known as the Morton B. Smith Co. in 1899.

WILLIAM C. RICE has been elected treasurer of the American Adamite Co., 410 Oliver Building, Pittsburgh, succeeding L. A. AMMON, resigned.

WILLIAM M. HENRY has been elected president of the Oswego Tool Co., Oswego, N. Y., succeeding his father, the late William J. Henry. PAUL A. HENRY, another son, has been made vice-president and treasurer, and C. N. WINFIELD, secretary.

ARTHUR JACKSON, president of the Arthur Jackson Machine Tool Co., Toronto, Canada, will sail from Montreal on Aug. 18 to attend the British Machine Tool Exhibition at Olympia, London, and also to visit a number of European plants.

CLAUDE HARTFORD has been elected vice-president of the American Elevator & Machine Corporation, 113 Cedar Street, New York. He was re-

cently manager of the industrial relations department of the New York Steam Corporation, having been associated with that company in July, 1913, and having served successively as assistant to the chief engineer, superintendent of the district embracing the lower portion of Manhattan, and engineer in the contract department. Mr. Hartford received his engineering education at Stevens Institute of Technology and Cornell University, and was graduated from the latter institution in 1910 with the degree of mechanical engineer. He has been a member of the American Society of Mechanical Engineers since 1912.

H. R. HIRE, who has been elected president of the recently organized Central Illinois Foundrymen's Club, has been president and manager of the Hire Foundry Co., 3000 North Adams Street, Peoria, Ill., since that company was founded April 1, 1926. He received his technical training at

H. R. HIRE

Bradley Polytechnic Institute, Peoria, and in 1910 became associated with the Acme Harvesting Machine Co., of the same city, as timekeeper in the foundry. In 1915 he was given charge of the melting and cost departments, and four years later went with the Maytag Co., Newton, Iowa, as metallurgist, also in charge of costs. He returned to Peoria in August, 1921, and after further study of metallurgy and cost finding, he organized the Crown Foundry Co. in July, 1922. He served as secretary and manager of this company until the founding of the Hire foundry.

A. F. MORRIS, for a number of years vice-president and sales manager of the Morgan Engineering Co., Alliance, Ohio, has been made president of that company. S. F. KALLENBAUGH, who has been with the company for 30 years, most recently as assistant sales manager, has been made sales manager. Mr. Kallenbaugh has been succeeded as assistant sales manager by TOM J. MUIR, who has been sales office manager. Mr. Muir has been identified with the Morgan company for 26 years.

WILLIAM PIEZ, Chicago district manager for the Concrete Steel Co., has tendered his resignation, effective Sept. 15.

H. P. LADDS has been appointed sales manager of the Lake Erie Bolt & Nut Co., Cleveland. For the past

four years he has been vice-president and general manager of the Maryland Bolt & Nut Co., Baltimore, and during the previous four years was general manager of the Rivet Grit Steel Co., Cleveland. At one time he was with the Bourne-Fuller Co. at New York and at Cleveland.

OBITUARY

JOHN T. BUCKLEY, of Philadelphia, formerly an executive of the Philadelphia Shipbuilding Corporation, died suddenly Aug. 6 while spending a vacation in Atlantic City, N. J.

WALDEMAR DRYSEN, chief mechanical engineer Blaw-Knox Co., Pittsburgh, was killed near his home at Sharpsburg, Pa., Aug. 5, evidently having been run down by an automobile. He was 38 years of age and was the inventor of the Blaw-Knox air preheater. For many years he was attached to the general offices of the United States Steel Corporation, and was an authority on such matters as furnace design and combustion.

WILLIAM A. PARKER, since 1905 purchasing agent for the Bessemer & Lake Erie and the Union railroads, subsidiaries of the United States Steel Corporation, died at Hesston, Pa., Aug. 6. He was born at Frostburg, Md., 65 years ago, and when a young man entered the employ of the Carnegie Steel Co., as a stenographer. Later he went with the Butler & Pittsburgh Railroad, which later was acquired by Andrew Carnegie and extended into what is now the Bessemer & Lake Erie Railroad.

FRANK McDOWELL LEAVITT, engineer and inventor and chief engineer of the E. W. Bliss Co., Brooklyn, died on Aug. 6 at his home in Scarsdale, N. Y. He was born at Athens, Ohio, March 3, 1856, and studied engineering at Stevens Institute of Technology, Hoboken, N. J., from which he was graduated in 1875. Immediately after graduation he became associated with Frederick E. Sickels in New York and aided in the development of the first steam steering gear used by the United States Navy. The following year he became associated with Bliss & Williams, Brooklyn. He left the company in 1881 but returned three years later when the firm had become the E. W. Bliss Co. and had remained with the organization ever since. One of his first important inventions was a tin can making machine which was widely utilized in the development of the canning industry. Later he brought out a toggle draw press for producing hollow pressed ware, which was followed by many other innovations in pressing and stamping machinery. He was also responsible for the Bliss-Leavitt torpedo now used by the United States

Navy. Mr. Leavitt was a member of the American Society of Mechanical Engineers, the American Society of Civil Engineers, the Society of Naval Architects and Marine Engineers, the American Association for the Advancement of Science and the Engineers Club of New York.

SAMUEL FRANK, a member of the Montgomery Iron & Steel Co., Philadelphia, structural steel fabricator, died on July 30. He was born at Diebolsheim-am-Rhine, France, in 1867, and studied ornamental iron work in a number of European cities before coming to the United States in 1889. In 1902 he became associated with the Steward & Stevens Iron Works, Philadelphia, continuing with the company after its merger with the Montgomery company in 1921.

P. V. VERNON, O. B. E., director and chief designer of Alfred Herbert, Ltd., Coventry, England, died on July 22 at his residence, Keresley Manor, North Coventry. He had been with the Alfred Herbert organization for 31 years and director since 1911.

WILLIAM H. NIEDRINGHAUS, superintendent of the National Enameling & Stamping Co., Granite City, Ill., and a member of the Niedringhaus family which founded that institution, died recently at his home in that city. He was born in St. Louis 70 years ago, and attended public schools there. His only occupation had been with the Enameling company, and at the time of his death he had served it consecutively for 50 years.

BENJAMIN THURSTON, general superintendent and a director of the American Screw Co., Providence, R. I., died Aug. 3, at the Massachusetts Homeopathic Hospital, Boston, following an illness of several weeks. He had been associated with the American Screw Co. for more than a half century, having started there as a machinist. He was born in Johnston, R. I., April 3, 1847. After attending the local schools he went to work for the Brown & Sharpe Mfg. Co., Providence. In 1902 he was made general superintendent of the American Screw Co.

HERBERT A. VIETS, president Fuller-Warren Co., Milwaukee, pioneer manufacturer of ranges and stoves, died July 29, aged 75 years.

Machinery Markets and News of the Works

Machine Tool Buying Steady

With July Sales Breaking Midsummer Records, Outlook for August Is Highly Satisfactory—Demand for Heavy Tools Is Slowest

PROSPECTS for a continued good rate of machine tool buying during August appear promising in the light of developments in the first week of the month. July sales broke midsummer records for many companies, and while there is no sign of further large orders such as were placed last month by the Wright Aeronautical Corporation and the General Electric Co., the volume of single tool sales remains steady and fairly large for this time of the year.

The Wright Aeronautical Corporation and General Electric Co. are understood to have some additional purchases to make to round out their new equipment.

An indication of the exceptional midsummer machine tool buying is seen in the statement by a Cleveland manufacturer of turret lathes that its July business was probably the largest in the history of the company.

Demand for heavy tools is slow, this being attributed to the small volume of railroad buying, but for small and medium-sized tools, and especially for high-production equipment, there is a steady inquiry. In the Chicago district tractor manufacturers are among the principal buyers. The A. O. Smith Corporation, Milwaukee, is in the market for three planers, five shapers, two turret lathes, three radial drills and a lathe.

Buying of tools in New England is better than it has been in some time. The city of Boston has bought a fairly large list of tools for its new Hyde Park school.

New York

NEW YORK, Aug. 7.—Machine tool buying in the first week of August continued at a steady pace, although it lacked large orders such as were placed in July by the Wright Aeronautical Corporation and the General Electric Co. Most of the current buying is in single tools and is being done by the more progressive companies, which recognize the necessity of replacing old tools with new and of cutting down unit production costs by the installation of the most modern equipment. Nearly all machine tool sellers in this market have a fair amount of business in prospect.

Niles-Bement-Pond Co. has sold 13 double-crank, straight-side presses, a Morris 3-ft. radial drill, an Acme 2-in. bolt cutter, a Cincinnati No. 4 high-speed tapping machine, two Ransom grinders and an Aurora 36-in. drill. Pratt & Whitney division sold four No. 2 jig borers, two 7 x 32-in. lathes, four No. 3 die sinkers, a 4-A plain die sinker, a 4-A universal die sinker, a 4½ x 12-in. thread milling machine, a 6 x 60-in. thread milling machine, a 6 x 90-in. thread milling machine, two 14-in. vertical surface grinders, five lathes and other tools.

E. W. Bliss Co., Fifty-third Street and Second Avenue, Brooklyn, manufacturer of presses and heavy machinery, is planning to devote portion of works to production of airplane engines and parts and is in negotiation for American rights for British engine unit. Company will limit output solely to engines and will not build complete airplanes.

Charles Hvass & Co., 508 East Nineteenth Street, New York, manufacturers of machinery and parts, have purchased adjoining property, and will use for expansion.

Board of Trustees, Woodlawn Cemetery, 20 East Twenty-third Street, New York, has plans for two-story automobile service, garage and mechanical shop, 62 x 145 ft., to cost approximately \$100,000 with equipment.

Officials of Gotham Silk Hosiery Co., 389 Fifth Avenue, New York, are organizing a subsidiary to take over patent rights and manufacture a recently perfected machine for mending hosiery. A plant will be established for manufacture of parts and assembling. S. E. Summerfield is president.

Board of Education, Ticonderoga, N. Y., plans installation of manual training equipment in new two-story high school to cost \$300,000, for which bids are being asked on general contract until Aug. 15.

Tooker & Marsh, 101 Park Avenue, New York, are architects.

Consolidated Automatic Merchandising Corporation, New York, has been organized to take over and consolidate General Vending Corporation, Automatic Merchandising Corporation, 285 Madison Avenue; Remington Service Machines, Inc., Schermack Corporation of America, and Sanitary Postage Service Corporation, 285 Madison Avenue, manufacturers and distributors of automatic and other vending machines. Consolidated company will be affiliated with United Cigar Stores Co. of America, 44 West Eighteenth Street, and will carry out expansion program for increased production and development of additional vending machine units. Headquarters will be established at 285 Madison Avenue. A. J. Sack is chairman of board, and Joseph J. Schermack, president.

T. E. Conklin Brass & Copper Co., 54 Lafayette Street, New York, has leased property at 113-15 Leonard Street, for expansion.

Charles Schaefer, Jr., 332 East 149th Street, New York, architect, has plans for a two-story automobile service, repair and garage building, 100 x 150 ft., to cost close to \$100,000 with equipment.

Otis Elevator Co., Eleventh Avenue and Twenty-sixth Street, New York, has acquired six-story adjoining building for expansion.

William Shary, 41 Union Square, New York, architect, has filed plans for a four-story automobile service, repair and garage building at 407-13 Sixty-first Street, to cost about \$100,000 with equipment.

Lackawanna Railroad Co., 90 West Street, New York, is reported considering plans for steam-operated electric power plant on Hackensack River, near Kearny, N. J., to cost more than \$4,000,000, to be used in connection with proposed electrification of suburban lines.

G. Edson Clark, Inc., Newark, operating an automobile body works at 562 Central Avenue, has leased building at 146 Norfolk Street for expansion.

Board of City Commissioners, Asbury Park, N. J., has work under way on a new power plant for central heating service to cost more than \$250,000 with equipment. Whitney Warren, 16 East Forty-seventh Street, New York, is architect.

F. L. Smidth & Co., 50 Church Street, New York, engineers, and manufacturers of cement mill machinery, have awarded general contract to Charles Flocken, 681 Newark Avenue, Elizabeth, N. J., for one-story foundry addition at Elizabeth, to cost about \$25,000. John S. Branne, Grand Central Terminal, New York, is consulting engineer.

Board of City Commissioners, Newark, has taken out permit for a new hangar at municipal airport, Port Newark, with repair facilities, to cost about \$65,000.

Board of Education, Bogota, N. J., is said to be planning installation of manual training equipment in four-story addition.

The Crane Market

VERY little new inquiry is reported either for electric overhead or locomotive cranes and buyers are slow to award business in some cases as a result of executives being on vacation at present. In the locomotive crane field two cranes for the New York Central Railroad are pending and a sand and gravel company in the New York district is in the market for three new cranes to replace three cranes that are in use. Lehigh University, Bethlehem, Pa., is in the market for a 10-ton, 18-ft. span, 3-motor overhead crane for a new laboratory

building. Carnegie Steel Co. will close in a few days for a 10-ton double trolley, 84-ft. span crane for its new warehouse near the McCutcheon mills, Pittsburgh.

Among recent purchases are:

F. L. Smidth & Co., 50 Church Street, New York, four overhead cranes for the Monolith-Portland Cement Co., Laramie, Wyo.; a 25-ton, 30-ft. span, 1-motor, 2-ton, 29-ft. span, 1-motor, 7-ton, 15-ft. 6-in. span hand power and 5-ton, 35-ft. span, hand power to a builder in the Middle West.

William F. Kenny Co., New York, con-

tractor, 20-ton electric locomotive crane, reported purchased from Ohio Locomotive Crane Co.

Hart & Early Co., 18 East Forty-first Street, New York, 5-ton truck crane from Browning Crane Co.

American Sheet & Tin Plate Co., for Monessen, Pa., works, one 15-ton, 58-ft. span crane from Cleveland Crane & Engineering Co.

McClintic-Marshall Co., for Leetsdale, Pa., works, two 30-ton, 34-ft. span cranes from Shaw Crane Works.

to high school, to cost about \$170,000, for which plans will be drawn by C. V. R. Bogert, 210 Main Street, Hackensack, N. J., architect.

Sonatron Tube Co., 88 Eighth Avenue, Newark, manufacturer of radio equipment, has awarded a general contract to Drill Construction Co., 889 Broad Street, for a four-story addition, 45 x 120 ft., to cost approximately \$75,000 with equipment. Siegler & Greenberg, 164 Market Street, are architects.

V. J. Eck, Broad Street, Red Bank, N. J., architect, has completed plans for two-story automobile service, repair and garage building, 80 x 100 ft., to cost more than \$100,000, with equipment.

Nizinite Metals Corporation, Perth Amboy, N. J., has been formed to manufacture nickel and chrome plates, zinc sheets and other metals. Plant will soon be in operation at Perth Amboy and materials and equipment have been contracted for.

Philadelphia

PHILADELPHIA, Aug. 6.—Property at Berks and Hancock Streets, Philadelphia, consisting of factory units on site, 109 x 240 ft., have been acquired by Acme Copper Smithing & Machine Co., 1024 Ridge Street, and will be used for expansion.

Yorke Iron Works, Inc., Philadelphia, has been organized with capital of 100 shares of stock to take over and expand company of same name with local works at 5738 Westminster Avenue. New company is headed by William A. Matsinger, 611 North Fifty-second Street, and James A. Lynd, 6362 Overbrook Avenue.

Atlantic Refining Co., 260 South Broad Street, Philadelphia, has arranged for increase in capital from \$50,000,000 to \$100,000,000, a portion of proceeds to be used for expansion. Company is said to be planning construction of new oil refinery in vicinity of Atreco, Tex., on Neches River, to cost in excess of \$12,000,000 with machinery, and will also carry out pipe line project in this same district through its subsidiary, Atlantic Pipe Line Co., totaling about 500 miles.

William Worlock & Co., Philadelphia, have leased property at 315 North Seventh Street and will establish a new machine shop.

Congoleum-Nairn Co., Inc., 1421 Chestnut Street, Philadelphia, manufacturer of linoleum, cork and other flooring, has awarded general contract to W. W. Lindsay & Co., Harrison Building, for five new units at plant at Marcus Hook, Pa., to cost about \$500,000 with machinery.

Work will include an automobile service, repair and garage building for company cars.

In connection with recent award by Gulf States Paper Corporation, Tuscaloosa, Ala., to United Engineers & Constructors, Inc., Sixteenth and Walnut Streets, Philadelphia, and 125 East Forty-sixth Street, New York, headed by Dwight P. Robinson, for new power plant, contracting company will make all purchases of equipment and carry out complete design and erection. Unit will be equipped with three 1000-hp. boilers and 7500-kw. turbo-generator, with pumping machinery, and complete accessories. Plant will use pulverized coal for fuel.

Following recent purchase of electric range division of Simplex Electric Heating Co., Cambridge, Mass., by Buckwalter Stove Co., Royersford, Pa., purchasing company will continue production at Cambridge works until October, at which time it is purposed to remove equipment to Royersford, where manufacture will be concentrated. Last noted plant will be increased to accommodate the expansion. Simplex company disposed of its appliance division to Edison Electric Appliance Co., Chicago, a subsidiary of General Electric Co., and is discontinuing operations.

Aircraft Development Co., Trenton, N. J., recently formed with capital of \$500,000, has established temporary offices at 220 Garfield Avenue and plans early operation of plant for manufacture of airplanes, including parts and assembling departments. William J. Ross and Floyd Patton, 130 North Warren Street, head new company.

Lehigh Valley Railroad Co., 143 Liberty Street, New York, has begun construction of new engine house at Lehighton, Pa., with repair facilities, to cost about \$75,000 with equipment.

Fletcher Works, Inc., Second Street and Glenwood Avenue, Philadelphia, manufacturer of textile machinery and parts, has purchased plant and business of Scranton Silk Machine Co., Scranton, Pa., manufacturer of similar equipment, and will consolidate with its organization. Production will be discontinued at Scranton and equipment removed to Philadelphia works, which will carry out expansion program.

Ludington Flying Service, Inc., Atlantic Building, Philadelphia, has plans for new hangar with repair facilities at Island Road and Penrose Ferry Boulevard, where aircraft field will be developed.

Following recent purchase of business and patents of Wright Mfg. Co., Lisbon, Ohio, manufacturer of chain hoists, etc., by American Chain Co., Bridgeport, Conn.,

and York, Pa., latter company is planning for removal of machinery to York plant in October, and will carry out expansion at that works. Wright company continues ownership of plant and buildings at Lisbon and is reported planning development of its foundry business after removal of acquired division.

Albert E. Peterson, 307 Trainer Avenue, Ridley Park, Pa., and associates have organized Moldic Co., with capital of \$20,000, and plans early operation of plant at Philadelphia for manufacture of ventilating equipment and devices. Edwin F. Uhland, 2828 D Street, Philadelphia, is also interested in new company.

Girard Smelting & Refining Co., Philadelphia, has purchased property in Philadelphia formerly occupied by Tacony Steel Co. Plant covers 46 acres and includes about 30 brick and steel buildings. Improvements and installation of new equipment will require about one year, after which Girard company's business, now housed in two plants, will be concentrated at new location.

New England

BOSTON, Aug. 6.—The buying of equipment by the city of Boston for its new Hyde Park district school featured an otherwise quiet machine tool market the past week. As purchases are divided among a number of dealers and manufacturers, a check-up on the actual number of tools bought cannot be made at this time. It is believed, however, a fairly large number of tools have been placed, although not as many as were contained in the original requisitions. Bids close today for millwright equipment for both old and new Hyde Park district high schools.

Small tools are selling much better than a year ago, and are about on a level with sales a month ago.

American Thermos Bottle Co., Norwich, Conn., has started work on an addition.

Bennett Wire Co., Norwalk, Conn., has sold its stock and business to Hudson Wire Co., Ossining, N. Y. Production will be resumed under name of Pequot Wire Co.

Cavanagh-Dobbs, Inc., South Norwalk, Conn., has awarded contract for a three-story plant, 260 x 300 ft.

Central Maine Power Co., Augusta, Me., has started work on a new power plant at Burnham, Me., for which miscellaneous equipment is required.

Goss & DeLeeuw Machine Co., New

Britain, Conn., has let contract to Alberthaw Co., Boston, for one-story manufacturing building, 100 x 175 ft.

Contract has been let by Raybestos Co., Inc., Bridgeport, Conn., manufacturer of brake lining, etc., to W. J. Shaughnessy, Jr., Fairfield Avenue, for one-story addition to plant at Stratford, Conn., 100 x 360 ft., to cost more than \$100,000 with machinery.

Bristol Co., Waterbury, Conn., manufacturer of recording instruments, has plans under way for one-story addition, to cost close to \$45,000 with equipment. F. A. Webster, 51 West Main Street, is architect.

Androscoggin Foundry Co., Auburn, Me., has completed plans for a one-story addition, to cost in excess of \$25,000 with equipment.

E. Ingraham Co., North Main Street, Bristol, Conn., manufacturer of clocks, clock mechanisms, etc., will take bids about Aug. 15 for five-story addition, 50 x 162 ft., to cost more than \$90,000. Max J. Unkelbach, New Britain, Conn., is architect.

Kingsbury Machine Co., Myrtle Street, Keene, N. H., has awarded general contract to G. W. Scott, 28 Washington Street, for two-story addition, to cost more than \$30,000 with equipment.

Fire, July 28, destroyed a building at plant of C. E. Bradley Corporation, Brattleboro, Vt., manufacturer of handles, etc., with loss reported at \$21,000. It is planned to rebuild.

Officials of Dard Hunter's Paper Mill, Chillicothe, Ohio, have organized Dard Hunter, Inc., a subsidiary, with capital of \$50,000, to take over former plant of Barnum & Richardson Co., Lime Rock, Conn., recently purchased by parent organization. New company will remodel with early installation of machinery for new mill. Entire project is reported to cost more than \$80,000. Dard Hunter, Chillicothe, is head.

Detroit

DETROIT, Aug. 6.—Plans are being considered by Stinson Aircraft Corporation, Northville, Mich., for a one-story addition, to cost about \$25,000 with equipment.

P. R. Periera, Polk Directory Building, Detroit, architect, has completed plans for new two-story service, repair and garage building, to cost approximately \$100,000 with equipment.

Electrical Warehouse, Inc., 452 West Larned Street, Detroit, is having plans drawn for new two-story service, storage and distributing plant, 75 x 190 ft., to cost in excess of \$65,000. Wright & Nice, General Motors Building, are architects.

Air Reduction Sales Co., 342 Madison Avenue, New York, manufacturer of industrial oxygen, automatic welding machines, etc., is reported considering new branch plant near Center Line, Mich., to cost more than \$45,000 with equipment.

Cadillac Malleable Iron Co., Cadillac, Mich., has plans for extensions to increase output about 25 per cent. It recently arranged for increase in capital from \$500,000 to \$650,000, a portion of proceeds to be used for expansion.

Board of Education, Grand Rapids, has plans for an addition to vocational and technical high school, to cost more than \$150,000 with equipment. Turner & Thebaud, Michigan Trust Building, are architects, and W. W. Bradfield, same address, is engineer.

Higgins Brass & Mfg. Co., 12435 Dequindre Street, Detroit, will soon begin work on an addition, to cost upward of \$50,000 including equipment. George V. Pottle, Davis-Whitaker Building, is architect.

Ex-Cel Paper Co., Bangor, Mich., has plans for a new two-story mill, to cost more than \$400,000 with machinery, and will ask bids soon on general contract. Billingham & Cobb, 211 Woodward Avenue, Kalamazoo, are architects and engineers.

Plant of Cummer Mfg. Co., Cadillac, Mich., manufacturer of boxes, crates, etc., has been acquired by new interests, headed by J. P. and George Wilcox, Cadillac. A new company is being formed to establish works for manufacture of springs for automobile seats and kindred products.

Detroit Edison Co., Second Boulevard, Detroit, has authorized plans for a five-story power substation at Grand River and Larchmont Avenues, to cost \$215,000 with equipment. It will build another such station on Jefferson Avenue, to cost \$400,000.

Central Specialty Co., East Forest Avenue, Ypsilanti, is planning a one and two-story addition to foundry, to cost in excess of \$40,000 with equipment.

Acme Equipment Co., Inc., Detroit, dealer in new and used contractors' and power plant equipment, has removed its offices to 216 Hammond Building, Fort and Griswold Streets.

South Atlantic

BALTIMORE, Aug. 6.—Contract has been let by Crown Cork & Seal Co., 1511 Guilford Avenue, Baltimore, manufacturer of metal bottle caps, bottling machinery, etc., to C. W. Schmidt, Hearst Tower Building, for one-story addition to plant at Highlandtown, to cost more than \$45,000 with equipment. L. R. White, Hearst Tower Building, is architect.

Salisbury Shipbuilding Co., Salisbury, Md., recently organized, has taken over former local shipyard of Smith & Williams, and will remodel and install new equipment for new plant. Ralph H. Grier and Charles T. Fisher, Salisbury, are heads.

International Harvester Co., Inc., 606 South Michigan Avenue, Chicago, has asked bids on general contract for new factory branch, service and repair building for motor truck division at Washington, to cost close to \$100,000 with equipment. E. A. Adt, Barr Building, Washington, is architect; C. B. Raffer, same address, is consulting engineer.

Stieff Co., 17 North Liberty Street, Baltimore, manufacturer of silverware and plated ware products, has awarded general contract to L. L. Chambers, Inc., Roland Avenue and Thirty-sixth Street, for one-story addition to plant, to cost more than \$30,000 with equipment.

Baker County Power Co., Camilla, Ga., purchased municipal electric light plant and waterworks at Norman Park, Ga., and plans extensions and improvements in that section. Company is operated by W. B. Foshay Co., Minneapolis, Minn.

United States Shipping Board, Washington, will receive bids until Aug. 21 for installation of main Diesel engines and auxiliary equipment on eight vessels of Merchant Fleet Corporation, including boilers, pumping units, etc. Capt. R. D. Gatewood is manager of maintenance and repair division.

Dempsey-York Co., Statesville, N. C., recently organized by A. P. Dempsey, 114 South Catherine Street, Baltimore, and D. H. York, Statesville, plans early operation of local plant for manufacture of sheet metal-working machinery and parts. It is understood that property has been acquired.

Board of Bibb County School Commissioners, Macon, Ga., plans construction of manual training shop additions to boys' high school, to be carried out in connection with school expansion program to cost about \$5,000,000.

Broad River Power Co., Columbia, S. C., a subsidiary of General Gas & Electric Co., 50 Pine Street, New York, is planning for increase in steam-operated electric generating plant at Parr Shoals, comprising new 30,000-kw turbo-generator, boilers and auxiliary equipment, to cost more than \$1,000,000. Company will also extend transmission line for connection with system of Lexington Water Power Co., an affiliated organization.

Midville Veneer Co., Midville, Ga., is considering rebuilding portion of mill destroyed by fire June 30, with loss in excess of \$130,000 including equipment.

Board of District Commissioners, District Building, Washington, is said to be planning installation of manual training equipment in new E. A. Paul Junior High School, to cost more than \$450,000 with equipment. A. L. Harris, District Building, is city architect.

Burwell-Harris Motor Co., 229 North Tryon Street, Charlotte, N. C., has awarded general contract to Southeastern Construction Co., 210 West Second Street, for three-story service, repair and garage building, 91 x 100 ft., to cost close to \$100,000. Lockwood, Greene & Co., Inc., Charlotte, are architects and engineers.

Virginia Electric & Power Co., Richmond, Va., plans construction of hydroelectric power house on Roanoke River, near Roanoke Rapids, for an initial output of 25,000 kw., to cost more than \$2,000,000 with power dam and transmission system.

Pierson-Larkin Refrigerating Corporation, Atlanta, Ga., recently organized with capital of \$100,000 by Virgil P. Warren, 1065 Ponce de Léon Avenue, and associates, plans operation of plant for manufacture of a patented aluminum electric refrigerating coil. Lester U. Larkin is also interested in company.

Anniston Scrap Material Co., Inc., North Broad Street, Rome, Ga., plans purchase of a conveyor and hoisting equipment. H. W. Buckner is general manager.

Pittsburgh

PITTSBURGH, Aug. 6.—Only one local machine tool dealer found July to have been a good month in point of sales. This firm sold several grinding machines to the Pennsylvania Railroad and had orders from the Pittsburgh & Lake Erie Railroad, Montour Railroad and Pressed Steel Car Co., and also shared in the orders placed by the Westinghouse Electric & Mfg. Co.

A vocational department has been authorized by Board of Education, Tyrone, Pa., in three-story and basement high school to cost about \$300,000, for which bids have been asked on general contract. Lawrie & Green, Third and Forster Streets, Harrisburg, Pa., are architects.

Reynolds Metals Co., recently organized with capital of about \$25,000,000, will take over and consolidate Robertshaw Thermostat Co., Youngwood, Pa., manufacturer of plumbing and heating specialties, with a number of other companies, including Fulton Syphon Co., Knoxville, Tenn.; United States Foil Co., Louisville, and Beech-nut Foil Co., Canajoharie, N. Y. New organization will continue production at all plants and contemplates expansion program in line of tin foil, heating, plumbing and affiliated mechanical equipment. Headquarters will be maintained at Louisville; Richard S. Reynolds, head of United States Foil Co., will be president of consolidated organization, and C. K. Reynolds, vice-president.

Pittsburgh Plate Glass Co., Frick Building, Pittsburgh, is arranging for increase in capital from \$50,000,000 to \$65,000,000, a considerable portion of proceeds to be used for expansion. Company will build an addition to branch plant at Clarksburg, W. Va., to cost more than \$300,000 and is also interested in Pittsburgh Safety Glass Co., recently organized, which will soon proceed with plant at Creighton, Pa., for production of shatterproof glass, to cost more than \$1,000,000 with machinery. Parent company will also carry out expansion program at plant at Ford City, Pa., to cost upward of \$4,500,000.

City Council, New Martinsville, W. Va., has authorized bond issue of \$124,000 for construction of municipal electric light and power plant to cost \$83,000, and transmission and distributing system to cost \$41,000.

City Council, Erie, Pa., has authorized acquisition of 100 acres near Buffalo Road for a municipal airport, to include hangars, repair and reconditioning shops, oil storage and distributing buildings, to cost more than \$100,000 with equipment.

Seamless Tube & Steel Co., New York and Pittsburgh, has been organized as consolidation of tube sales departments of Roland Steel Products Corporation, 114 Liberty Street, New York, and Paul F. Hermann Co., Keenan Building, Pittsburgh, and will engage principally in buying and selling tubular and other steel products, largely imported. Roland and Hermann companies will continue to operate separately on all products except tubular goods.

Lewis Foundry & Machine Co., Pittsburgh, is in market for a second-hand 500-lb. electric furnace, complete. M. Matthews is purchasing agent.

Indiana

INDIANAPOLIS, Aug. 6.—Plans are being completed by Federal Foundry Co., 502 South Harris Street, Indianapolis, for eight one-story additions, comprising brass foundry, 50 x 55 ft.; core room addition, 40 x 80 ft.; pattern shop, 40 x 50 ft.; two flash units, 38 x 100 ft., and other shops, to cost close to \$200,000 with equipment. Carter-Richards Co., Engineers' Building, Cleveland, is architect and engineer.

William M. Torrence, Muncie, has plans for a four-story automobile service, repair and garage building, 60 x 125 ft., to cost close to \$100,000 with equipment.

National Mill Supply Co., Fort Wayne, has awarded general contract to Olds Brothers, First National Bank Building, for an addition to cost about \$45,000 with equipment.

Martin-Parry Corporation, 1100 West

Henry Street, Indianapolis, manufacturer of automobile bodies, is removing equipment from plant of Cleveland Windshield Co., 1520 Fairfield Avenue, Cleveland, recently acquired, to Indianapolis works, where new department will be developed for this branch of manufacture. Company will also establish new chromium plating department for windshield parts.

Board of Education, Richmond, has taken option on 20-acre tract in southwest section of city as site for new high school, with manual training department, entire project to cost in excess of \$400,000 with equipment. Architect will soon be selected to prepare plans. W. Bates is superintendent in charge.

Cleveland

CLEVELAND, Aug. 6.—Machine tool dealers have had a fair amount of business the past week, bookings having consisted mostly of orders for single tools from widely diversified sources. The volume of inquiry indicates that sales this month probably will be about normal for midsummer. Some postponement of buying is noted on account of the absence of executives whose approval is necessary before orders can be placed. A local turret lathe manufacturer states that the number of sales made in the last 30 days probably is the largest in the history of the company. Production is being well maintained and in some cases deliveries cannot be made in less than four to five weeks.

Contract has been let by United States Aluminum Co., 2210 Harvard Avenue, Cleveland, a subsidiary of Aluminum Co. of America, Pittsburgh, to Industrial Construction Co., 308 Euclid Avenue, for five-story factory branch and distributing plant, 75 x 140 ft., to cost about \$300,000.

Grabler Mfg. Co., 6565 Broadway, Cleveland, manufacturer of clamps, hangers, etc., is having plans drawn for one-story addition, 40 x 80 ft., to cost about \$35,000 with equipment. Christian, Schwarzenberg & Gaede, Euclid Building, are architects.

Snappy Radiator & Battery Service Co., 736 Cleveland Avenue, S. W., Canton, Ohio, has awarded general contract to H. B. Fisher, Canton, for one-story addition, to cost about \$42,000 with equipment.

Scott-Ullman Co., 3311 Perkins Avenue, N. E., Cleveland, manufacturer of electric lighting fixtures and equipment, has leased about 10,000 sq. ft., at 2480 East Twenty-second Street for expansion.

Max Marmorstein, 1353 Chester County Union Mortgage Building, Cleveland, is at head of project to construct and operate a six-story automobile service, repair and garage building, 90 x 125 ft., to cost about \$250,000 with equipment.

Willard Storage Battery Co., 246 East 131st Street, Cleveland, has plans for one-story addition, 65 x 215 ft., to cost more than \$80,000 with equipment. R. C. Norberg is president and general manager.

Aetna Rubber Co., 815 East Seventy-ninth Street, Cleveland, manufacturer of hard and soft molded mechanical and other rubber goods, is completing plans for new plant at Ashtabula, Ohio, to cost close to \$100,000 with machinery. S. T. Campbell is president and general manager.

Cleveland Blow Pipe & Mfg. Co., formerly at 6950 Kinsman Road, Cleveland, has moved into larger quarters at 6505 Cedar Avenue.

Midland Furnace Co., 735 Huntington Bank Building, Columbus, Ohio, has been organized to manufacture warm air furnaces. It has secured property on Hocking Valley tracks in northwest section of city and contracts for factory buildings will be let at once. Furnaces will be made of 3/16-in. plates and No. 12 gage sheets and plant will have capacity of 25,000 units per year. R. C. Walker is president and general manager.

Auto-Diesel Piston Ring Co., 4520 Superior Avenue, Cleveland, has purchased Austin & Smith Co., Cleveland, and will operate as spring and wire forming department. Company now manufactures coil, extension, flat, spiral and torsion springs; metal body and furniture polish; compression rings for compressors, cranes, pumps, machinery, engines, lighting plants, and oil control and compression piston rings for automobiles, trucks and tractors.

Buffalo

BUFFALO, Aug. 6.—Bids will soon be asked on general contract by National Grinding Wheel Co., 2984 Main Street, Buffalo, J. J. Russ, general manager, for new abrasive and grinding wheel plant at Tonawanda, N. Y., consisting of one and two-story units, 80 x 100 ft. and 40 x 100 ft., respectively, and one-story office, to cost close to \$70,000 with equipment. L. A. Harding Construction Corporation, 1335 Main Street, Buffalo, is architect and engineer.

Champion Paper Co., Carthage, N. Y., has approved plans for one-story addition, 100 x 240 ft., to cost more than \$80,000 with machinery. It is scheduled for completion early in November. J. E. Warner, chief engineer for St. Regis Paper Co., Watertown, N. Y., an affiliated organization, is engineer.

Board of Education, Sidney, N. Y., is considering installation of manual training equipment in new three-story high and grade school to cost \$250,000, for which bids have been asked on general contract. Palmer Rogers, 101 Park Avenue, New York, is architect.

Genesee Motoramp Garage, 93 Pearl Street, Buffalo, C. F. Moe, manager, will soon take bids on general contract for six-story service, repair and garage building, to cost close to \$500,000 with equipment. E. B. Green & Sons, and A. Hart Hopkins, 1 Niagara Square, are architects.

International Paper Co., 100 East Forty-second Street, New York, is abandoning its mills at Glen Park, N. Y., and property has been placed on market, with water power rights retained by present owner. Company is said to be arranging plans for hydroelectric power development at this point, to cost in excess of \$1,000,000 with transmission lines.

Board of Education, Malone, N. Y., plans installation of manual training equipment in new two-story high school to cost in excess of \$500,000, for which bids will soon be asked on revised plans. Fuller & Robinson, 95 State Street, Albany, N. Y., are architects.

City Council, Niagara Falls, N. Y., has been authorized to acquire tract of 230 acres near Tuscarora Road for new municipal airport, to include hangars, repair and conditioning shops, oil storage and distributing building, and other units, with entire cost in excess of \$100,000.

Chicago

CHICAGO, Aug. 6.—July witnessed the close of several large industrial lists and August opens with the promise of a large volume of business, the bulk coming from widely scattered sources as indicated by the character of inquiries. There still is a substantial amount of business coming from tractor plants and it is probable that Allis-Chalmers Mfg. Co., will buy new equipment for its tractor works at Milwaukee, and Springfield, Ill. From the viewpoint of inquiry, dealers look on this as the best opening week in August for many years.

The A. O. Smith Corporation, Milwaukee, is in the market for three planers, five shapers, two turret lathes, a 36-in. lathe and three 4-ft. radial drills. The Chicago, Rock Island & Pacific is asking for prices on two 36-in. shapers, a 36-in. boring mill and a 36-in. lathe. Forging plants in this district are busy and are buying die making machinery. An automobile parts manufacturer in Iowa has purchased a No. 2 milling machine and the Nash Motors Co. is buying a few items for its three plants in Wisconsin.

Chicago State Co., Chicago, Charles J. Vopicka, president, will build a five-story public garage to cost \$300,000. Fox & Fox, 38 South Dearborn Street are architects.

Rodell Stattner, formerly superintendent of mechanical department of the Tipps Tool Co., will open a machine shop at Taylorville, Ill.

Martin Machine Works, 2234 Walnut Street, Chicago, has awarded contract for a new machine shop, 48 x 125 ft.

Furst-McNess Co., Freeport, Ill., plans installation of power equipment in connection with factory addition. The entire project will cost \$140,000.

East Side Levee & Sanitary District, Granite City, Ill., John D. Johns, president, will take bids for two pumping stations with mechanical equipment.

George Brumlich, 171 West Wacker Drive, Chicago, will build a 10-story garage, 80 x 149 ft., to cost \$500,000. B. W. Construction Co., is general contractor.

International Steel & Iron Co., 3136 West Fifty-first Street, Chicago, will build a two-story warehouse to cost \$200,000.

Cedar Rapids Pump & Supply Co., Cedar Rapids, Iowa, manufacturer of plumbing, heating, factory and well supplies, and Central Steel Products Co., Clinton, Iowa, maker of pipe nipples, spacers and fabricator of pipe, have been merged as Central Steel Products Co., with headquarters in Merchants National Bank Building, Cedar Rapids. Plants in Cedar Rapids and Clinton will be continued.

Plans are under way by American Can Co., 104 South Michigan Avenue, Chicago, for two-story top addition to plant at 6025 Western Avenue, to cost in excess of \$80,000. Engineering department at company headquarters, 120 Broadway, New York, is in charge.

Indestro Mfg. Co., 2650 Coyne Avenue, Chicago, manufacturer of universal joints, screw drivers, valve lifters and other tools, has arranged with Central Manufacturing District for new one and two-story plant, 300 x 305 ft., to be occupied under lease. It will cost in excess of \$400,000 with equipment. Present factory will be removed to new location and

increase in output arranged. A. Epstein, 2001 West Pershing Road, is engineer.

International Harvester Co., 606 South Michigan Avenue, Chicago, has awarded general contract to A. G. Wahl, 616 Seventh Avenue, South, St. Cloud, for a two-story factory branch, service, storage and distributing plant at St. Cloud, to cost about \$150,000 with equipment.

Hine Brothers Soap Co., 4023 South Ashland Avenue, Chicago, plans rebuilding portion of plant destroyed by fire Aug. 2, with loss close to \$90,000 with equipment.

Diamond Calk Horseshoe Co., 4632 Grand Avenue, Duluth, Minn., is considering one-story addition, to cost close to \$40,000 with equipment.

Phoell Mfg. Co., 5700 West Roosevelt Road, Chicago, manufacturer of nuts, screws, bolts, etc., will proceed with superstructure for a one-story and basement addition, 100 x 300 ft., to cost more than \$150,000 with equipment. General contract has been let to Calumet Liberty-Way Construction Co., 9401 Stoney Island Avenue. A. S. Alschuler, 53 West Jackson Boulevard, is architect.

Hart-Parr Co., Charles City, Iowa, manufacturer of traction engines and parts, and other equipment, is arranging for sale of 60,000 shares of preferred stock, a considerable portion of fund to be used for plant enlargements and improvements.

West End Scrap Iron & Metal Co., 1910 West Michigan Street, Duluth, Minn., has awarded general contract to R. J. MacLeod & Co., Builders' Exchange, for two-story and basement storage and distributing plant, 42 x 110 ft., to cost about \$30,000. Thomas J. Shefchik, Glencoe Building, is architect.

Board of Education, Onawa, Iowa, is said to be planning installation of manual training facilities in new two-story and basement high school to cost about \$125,000. Beuttler & Arnold, Grain Exchange Building, Sioux City, Iowa, are architects.

Aetna Industries, Inc., 11 East Austin Avenue, Chicago, manufacturer of ornamental iron and metal goods, has purchased a one-story factory, 50 x 100 ft., at 2539-41 West Lake Street, for expansion.

Milwaukee

MILWAUKEE, Aug. 6.—Expansion of local industries not only is furnishing local machine tool builders with considerable business, but orders from other industrial centers are making a favorable aggregate of new business. Inquiry is also active, encouraging confidence in the belief that good business is in prospect during the remainder of the year.

Industrial employment in Milwaukee at the beginning of August marked a new peace-time high record, the 44 reporting shops having 37,314 persons at work. The average for the first seven months this year is 36,484, compared with a monthly average of 35,171 for the year 1927.

In addition to new shop, 301 x 108 ft., three stories, for which International Harvester Co. has just placed contracts, erection of another unit of Milwaukee farm tractor and cream separator works at 784 Park Street is contemplated at an investment of approximately \$500,000. Work will be undertaken as soon as Milwaukee Common Council vacates 200 ft. of Park Street within limits of works

site, which is expected in about two weeks. Paul F. Schryer is general manager.

Davis & Thompson Co., Fifty-seventh Avenue and Mitchell Street, West Allis, Milwaukee, manufacturer of automatic milling and drilling machinery, lathes, etc., contemplates erection of an addition.

Wisconsin Tool & Mfg. Co., 1219 Thirtieth Street, Milwaukee, has purchased a three-story and basement building at Forty-fourth and State Streets for \$90,000 and will spend about \$50,000 in alterations and additional equipment.

A. J. Lindemann & Hoverson Co., First and Cleveland Avenues, Milwaukee, manufacturer of stoves, ranges, heaters, electrical appliances, etc., has placed general contract with Klug & Smith Co., consulting engineer, 69 East Wisconsin Avenue, local, for construction of a new boiler house unit. Two 400-hp. boilers have been purchased from the Wickes Boiler Co., Saginaw, Mich.

City of Milwaukee has accepted bid of Pacholski & Doligalski, 450 Mitchell Street, for erection of a \$100,000 machine shop and assembly floor for Milwaukee Fire Department. It will be used for constructing and servicing fire apparatus. Roland E. Stoelting is commissioner of public works.

Tobin Tool & Die Works, 200 Ruggles Street, Fond du Lac, Wis., is starting work on a one-story machine shop addition, 50 x 60 ft., to cost about \$25,000 complete.

Kohn Mfg. Co., 1375 Thirtieth Street, Milwaukee, manufacturer of garbage incinerating units, has placed general contract with Byrne Brothers, 3100 Burleigh Street, for a shop addition, 59 x 105 ft., costing about \$30,000 complete.

Milwaukee Mill Supply Co., 1379 Thirty-first Street, Milwaukee, will build a two-story shop and warehouse building, 50 x 120 ft. Architect is Hugo V. Miller, 862 Third Street.

Universal Foundry Co., Oshkosh, Wis., which is building an addition, has increased its authorized capitalization from \$50,000 to \$100,000.

Acme Iron & Steel Co. is new name adopted by former Acme Iron & Wire Works, 1927 St. Paul Avenue, Milwaukee. Company fabricates structural and ornamental iron work.

Kearney & Trecker Corporation, Milwaukee, will erect new three-story office, adjoining present office building, which will release about 5000 sq. ft. additional for manufacturing purposes.

St. Louis

ST. LOUIS, Aug. 6.—A new power plant has been authorized by Anheuser-Busch, Inc., Pestalozzi Street, St. Louis, consisting of two 5000-kw. turbo-generators, three 1100-hp. boilers, superheaters, pumping equipment and auxiliary machinery; pulverized coal will be used as fuel and facilities for storage and handling installed. Improvements will be made in present power house. Entire project will cost close to \$1,000,000. Ophuls & Hill, Inc., 112 West Forty-second Street, New York, is engineer.

P. T. Drotts, Reliance Building, Kansas City, Kan., architect, has completed plans for a four-story automobile service, repair and garage building to cost close to \$175,000 with equipment.

American Foundry Co., Maud, Okla., is considering plans for one-story foundry and machine shop to cost more than \$35,000 with equipment.

Sinclair Pipe Line Co., Sinclair Building, Tulsa, Okla., a subsidiary of Sinclair Consolidated Oil Co., 45 Nassau Street, New York, is reported planning construction of pipe line from vicinity of Cushing, Okla., to a point near Chicago, to cost more than \$10,000,000.

Automatic machinery, conveying and other equipment will be installed in one and two-story addition, 50 x 133 ft., and 40 x 100 ft., to be built by Coca-Cola Bottling Co., 2540 Penn Street, Kansas City, Mo., to cost close to \$100,000. Hans Von Unwerth, Finance Building, is consulting engineer.

State Board of Public Affairs, Oklahoma City, Okla., has approved immediate construction of new power plant at State School for Blind, Muskogee, Okla., to cost about \$40,000. Layton, Hicks & Forsythe, Braniff Building, Oklahoma City, are architects.

Gasconade River Power Co., Pioneer Trust Building, Kansas City, Mo., has secured permission to proceed with hydroelectric power project near Rich Fountain, Mo., including power dam and generating station with capacity of 25,000 hp. Entire project will cost in excess of \$1,000,000 with transmission lines.

Board of Managers, Missouri School for Deaf, Fulton, Mo., has awarded general contract to W. R. Odor & Son, Canton, Mo., for two-story manual training building, 51 x 101 ft., to cost close to \$45,000 with equipment. C. A. Smith, Finance Building, Kansas City, Mo., is architect.

City Council, Bismark, Mo., will take bids soon for pumping machinery, elevated steel tank and tower, and auxiliary equipment for municipal waterworks. A bond issue of \$47,000 is being arranged. Russell & Axon, Railway Exchange Building, St. Louis, are consulting engineers.

Oklahoma Gas & Electric Co., Oklahoma City, Okla., has work under way on addition to steam-operated electric power plant at Harrah, Okla., known as Horse-shoe Lake Station, to develop output of 65,000 hp. It is purposed to complete work in November or December. Plans are under way for construction of two additional transmission lines. Company is a subsidiary of Standard Gas & Electric Co., 231 South La Salle Street, Chicago.

Oklahoma Railway Co., Terminal Building, Oklahoma City, Okla., will proceed with erection of three one-story shops, 100 x 170 ft., and two units, each 50 x 120 ft., with one-story automobile service, repair and garage building, 80 x 200 ft. Entire project will cost in excess of \$100,000 including equipment. Guy B. Treat is consulting engineer.

L. B. Foster Co., Pittsburgh, has opened office at 1725 Railway Exchange Building, St. Louis, and will render service for users of industrial trackage.

Gulf States

BIRMINGHAM, Aug. 6.—A company has been organized by W. D. Hayden, Houston, Tex., and associates to construct and operate a lime plant on local site, using oyster shells as raw material. Arnold & Weigel, Woodville, Ohio, engineers, have been engaged to prepare plans for initial unit. It will be of rotary kiln type, with complete crushing plant and auxiliary equipment, to cost more than \$300,000 with machinery.

Southern Cotton Oil Co., Decatur, Ala., has acquired adjoining property and is reported planning an addition for commercial fertilizer production, to cost in excess of \$45,000 with equipment. Company will also carry out expansion pro-

gram at present mill to cost approximately \$25,000. Headquarters are in Produce Exchange Annex, New York.

Armour & Co., Union Stock Yards, Chicago, plan installation of conveying equipment, refrigerating and cold storage machinery in new packing plant at Monroe, La., to cost \$125,000.

J. J. & M. Taxman Refining Co., Wichita Falls, Tex., recently organized by J. J. Taxman, and associates; has purchased local oil refinery of Miller Refining Co., and will take immediate possession. New owner will carry out expansion and betterment program to develop daily output of close to 2500 bbl.

Slaton Cotton Oil Co., Slaton, Tex., is planning a new unit, to cost approximately \$40,000 with equipment.

City Council, Marlin, Tex., is asking bids until Aug. 14 for two electrically-operated centrifugal pumps, each with capacity of 450 gal. per min., with complete automatic auxiliary equipment. Plans and specifications at office of Levi Goodrich, city engineer.

Turner & McPherson, Martin Building, Birmingham, architects, have completed plans for one-story automobile service, repair and garage building, 100 x 190 ft., to cost close to \$90,000 with equipment.

Texas Pipe Line Co., operated by Texas Corporation, Houston, Tex., is said to be completing plans for construction of pipe line from its Alma Gray oil properties, Gray County, to Electra, Tex., about 154 miles, using 8-in. diameter welded steel pipe. A new pumping plant will be constructed in vicinity of last-noted place, entire project to cost more than \$5,000,000.

Board of Education, Tallahassee, Fla., is reported planning installation of manual training equipment in new high school to cost about \$250,000, for which plans will be drawn by Edwards & Sayward, Marietta Building, Atlanta, Ga., architects.

Hartline Mfg. Co., Tampa, Fla., recently organized by E. M. Lively, Tampa, Fla., and associates, has taken over former plant of Hartline Blotter Pen Co., and will manufacture a special self-blotting fountain pen and kindred products. An expansion and improvement program will be carried out, including erection of one-story factory.

City Council, Waco, Tex., plans establishment of municipal airport, including hangars, repair and reconditioning shops, and other units, to cost about \$75,000. A bond issue has been authorized.

Board of City Commissioners, S. E. Moss, water commissioner, City Hall, Dallas, Tex., has deferred receiving bids for waterworks machinery, including power and pumping equipment, etc., to cost approximately \$4,000,000, from Aug. 8 until Sept. 1. Fuller & McClintock, 170 Broadway, New York, are consulting engineers. J. B. Winder is chief engineer of Dallas water department.

Mississippi Power Co., Gulfport, Miss., affiliated with Alabama Power Co., Birmingham, has secured permission for a hydroelectric power development on Mississippi River, vicinity of Muscle Shoals. Plant will be designed for initial capacity of about 100,000 hp. and ultimate output of 260,000 hp., and is reported to cost more than \$4,000,000 with transmission lines.

Elliott Core Drilling Co., 3210 Harrisburg Street, Houston, Tex., manufacturer of oil well equipment, has acquired property on Canal Street and is considering construction of new one-story plant, to cost more than \$25,000 with equipment.

Cincinnati

CINCINNATI, Aug. 6.—Plans are being considered by E. E. Peters Machine Co., Springfield, Ohio, for new one-story plant for manufacture of patented automobile starter, including parts and assembling departments.

Radio Broadcasting Station WAIU, Elks' Country Club grounds, Columbus, Ohio, plans early rebuilding portion of power house and station destroyed by fire Aug. 2, with loss reported close to \$100,000, including equipment. M. V. Ackerberg is engineer.

Stanton Motors, Inc., 841 North High Street, Columbus, will take bids at once for two-story and basement service, repair and garage building, to cost \$100,000 with equipment. Richards, McCarty & Bulford, 584 East Broad Street, are architects.

Fairfield Paper Box Co., Baltimore, Ohio, has awarded general contract to Wilbur Weaver, Lancaster, Ohio, for one-story addition to corrugated paper box plant, to cost close to \$80,000 with equipment.

Henry Vogt Machine Co., Tenth Street, Louisville, manufacturer of ice-making and refrigerating machinery, has asked bids on general contract for multi-story addition to cost about \$340,000, a portion of structure to be used for storage and distribution. D. X. Murphy & Brothers, Louisville Trust Building, are architects.

Ovens, conveying machinery and other equipment will be installed in new plant to be built by Kentucky Macaroni Co., Inc., 121 North Fifth Street, Louisville, to cost about \$50,000. Clifford Reichert, Louisville, is architect.

Leschner Paper Co., State Street and Harrison Avenue, Cincinnati, has awarded general contract to Ferro Concrete Construction Co., Elm Street, for two-story and basement addition, to cost approximately \$75,000 including equipment.

Air Corps, Material Division, Wright Field, Dayton, Ohio, will receive bids until Aug. 15 for one straight and one irregular cutting shear, circular 66; 42,200 ft. ignition cable, and 46,000 ft. shielded power and lighting cable, circular 69; until Aug. 13 for 1796 belt assemblies, circular 64; until Aug. 17 for 200 control assemblies, 720 cock assemblies, 50 air intake manifolds, 320 engine exhaust stacks, 1200 fuel tank outlet screens, 1742 exhaust header flanges, etc., circular 70; 97 lever and bracket assemblies, 825 trigger motor assemblies, 332 sight assemblies, 365 post assemblies and 807 plunger end assemblies, circular 663.

Omher Fare Register Co., Dayton, Ohio, plans rebuilding portion of storage and distributing division destroyed by fire July 31, with loss close to \$40,000 with equipment.

American Rolling Mill Co., Middletown, Ohio, has awarded general contract to H. W. Cox, Ashland, Ky., for one-story storage and distributing unit, 160 x 270 ft., at its Ashland works, to cost \$175,000 with handling and other equipment.

Pacific Coast

SAN FRANCISCO, Aug. 1.—Plans are being completed by California Electric Refrigeration Corporation, Napoleon and Jerrold Streets, San Francisco, manufacturer of refrigerating equipment, for one-story plant at Berkeley, to cost about \$40,000.

Master Metalath Mfg. Co., Los Angeles, has awarded general contract to E. H. Goff, 1219 West Ninety-fifth Street, for a new one-story plant, 108 x 120 ft.

Union Oil Co., Mills Building, San Francisco, has plans for a new storage and distributing plant at Oakland, Cal., to cost close to \$100,000 with equipment.

Thomas A. Box, 63 Sunshine Street, Sausalito, Cal., and associates have organized Home Safety Match Co., to construct and operate a plant in Peninsula district, San Mateo County. Initial unit will cost more than \$500,000 with machinery. A machine shop will be installed. William E. Williams, Sausalito, is also interested in new company.

Roper Motor Co., Phoenix, Ariz., R. D. Roper, president, has acquired property at West Adams Street and Sixth Avenue, 135 x 200 ft., and plans construction of service, repair and garage building, to cost close to \$100,000 with equipment.

Hardie Mfg. Co., 55 North Front Street, Portland, manufacturer of spraying machinery and devices, has awarded general contract to A. C. Teller & Son, Worcester Building, for new one-story plant, to cost approximately \$40,000 with equipment. Headquarters are at Hudson, Mich.

Ogden Motor Car Co., Ogden, Utah, has leased a new building, 95 x 130 ft., to be erected at Washington Avenue and Binford Street, for new service, repair and garage building, to cost about \$85,000 with equipment. George C. Whitmeyer & Sons, First National Bank Building, are contractors.

Western Wax Paper Co., North Portland, has awarded general contract to Frank J. Leonard, Lewis Building, for a new one-story mill, 112 x 240 ft., to cost close to \$100,000 with machinery.

Zellerbach Paper Co., 1213 Front Street, Sacramento, Cal., is arranging for early rebuilding of portion of plant recently destroyed by fire, to be three stories, totaling 35,000 sq. ft. floor space, to cost \$180,000 with equipment.

Tucson Gas, Electric Light & Power Co., Tucson, Ariz., has approved plans for a new one-story equipment storage and distributing plant, with repair facilities, 60 x 165 ft., to cost close to \$40,000 with equipment.

Southern California Edison Co., Los Angeles, is arranging a fund of \$130,000,000 for extensions and improvements in hydroelectric power and steam power plants, transmission and distributing lines, power substations and other facilities over a period of five years, or on basis of about \$26,000,000 per year. Close to \$90,000,000 will be used for steel tower transmission lines and distributing systems.

Hesler Machine & Iron Works, Portland, Ore., was damaged by fire July 27, with loss estimated at from \$80,000 to \$100,000. The same fire also damaged Peerless Pattern Works adjoining and destroyed patterns accumulated over 30 years.

Foreign

CONTRACT has been let by Compania Colon Transaerea Espanola, S. A., Seville, Spain, to Fox Brothers International Corporation, 33 Rector Street, New York, for construction of airport at Buenos Aires, Argentina, including hangars, repair and reconditioning shops, parts shops, oil storage and distributing buildings and other units, project to cost about \$5,000,000 with equipment. Company will operate a giant dirigible line

between Seville and Buenos Aires, and recently awarded similar contract to Fox organization for airport at first noted place.

Department of Public Works, Supplies and Tenders, Auckland, New Zealand, will receive bids until Sept. 11 for two electric traveling cranes, each of 10 cwt. rating, for indoor service, as per specifications on file.

Moscow Water Supply Service, city of Moscow, Russia, plans extensions in municipal waterworks to increase capacity about 30,000,000 gal. per day, including pumping machinery, power equipment and auxiliary machinery. Delegation has come to United States to make study of modern systems of required type and will make headquarters at office of Amtorg Trading Corporation, 165 Broadway, New York. J. Andronov, president of Borough of Khamovniki, city of Moscow, heads delegation.

Mond Nickel Co., Ltd., Clydach, South Wales, British Isles, is planning early construction of a sixth refining unit at local plant, to cost more than \$400,000 with equipment.

Soviet Russian Government, Moscow, will increase capacity of shipyard at Sormov, for production of river boats and barges. A department will be installed for manufacture of Diesel engine units, including parts and assembling. An appropriation of \$9,600,000 is said to have been authorized for expansion. American-Russian Chamber of Commerce, 145 West Fifty-seventh Street, New York, has information on project.

Canada

TORONTO, Aug. 6.—For the first seven months of this year total machine tool business exceeded that of a year ago, and according to builders and dealers this has been one of the best years since the war. Makers of machinery report plant operations about 20 per cent better than last year and many have large unfilled orders on hand.

The Canadian National and Canadian Pacific Railways have been large buyers of equipment for shops, and additional purchases are in prospect. More interest is reported for mining equipment, several companies in northern Ontario having recently announced plans for new mill construction and development work. The automotive industry is not strongly represented among purchasing interests, but the General Motors Corporation is expected to be in the market soon for equipment for plants at Oshawa and Walkerville, Ont., and Regina, Sask.

High School Board, Welland, Ont., A. B. McLean, chairman, is receiving prices, catalogs, etc., on lathes and general equipment for vocational training shop for a proposed school to cost \$200,000.

Bids will be received by city clerk, City Hall, Quebec, until Aug. 20 for a pumping unit to be installed in waterworks plant. J. A. Tremblay is engineer.

Plans are being prepared for a dam and power house to be built at Dixville, Que., on the Coaticook River, for Desrochers & Normandin, Coaticook, Que. Engineer is A. C. Crepeau, 30a Wellington Street North, Sherbrooke, Que.

Bids are being received, no closing date set, by J. G. W. Campbell, Truro, N. S., for an addition to power plant of Truro Electric Commission.

Lang & Ross, Sault Ste. Marie, Ont., have commenced work on a power line

to Montreal River in connection with \$1,000,000 power development project near Sault Ste. Marie for Great Lakes Power Co., Ltd. Plans for power house are not yet ready.

Empire Stove & Furnace Co., Owen Sound, Ont., has started work on an addition to its foundry.

Standard Paper Box Co. is building a \$75,000 addition to its plant at Montreal. A. Leduc, 1488 Gilford Avenue, is general contractor; Baulne & Leonard are engineers.

New Trade Publications

Wire-Rope Slings.—John A. Roebeling's Sons Co., Trenton, N. J. Illustrated descriptive pamphlet of 85 pages covering slings made of wire rope for handling heavy materials, including locomotives, large beams and girders, boilers, heavy guns, roll housings and other materials. Various types of grab hooks and other auxiliary equipment are shown, including lifting beams.

Sprockets and Chains.—Boston Gear Works Sales Co., Norfolk Downs, Mass. Various types of steel and other chains and sprockets which have been standardized for delivery from stock are described and illustrated. Horsepower and load tables and list prices are included.

Oxy-Acetylene Equipment.—Oxweld Acetylene Co., 30 East Forty-second Street, New York. Catalog, 56 pages. New equipment includes a cutting blowpipe which is said to be immune from "back-fire," and a new line of portable low-pressure acetylene generators using compressed cakes of calcium carbide.

Electronic Tornado.—Lincoln Electric Co., Cleveland. Eight-page folder describing principles underlying automatic carbon arc welding by the electronic tornado process, properties of the joint so made, and machines developed for its use. The process was described in THE IRON AGE June 28, page 1810.

Materials - Handling Equipment.—Lewis-Shepard Co., Watertown, Mass. Catalog of 36 pages devoted to engineering features of elevating trucks, stackers, platforms and skid racks and hand trucks and barrows. The catalog is thoroughly illustrated and contains clearance and dimension data for various sizes of the different units.

Centrifugal Pumps.—Pennsylvania Pump & Compressor Co., Easton, Pa. Bulletin 212 of 16 pages, illustrated, describes a line of multi-stage centrifugal pumps, showing their application to various uses and methods of connecting up to electric motors, steam turbines, gas engines, belts, etc.

Shot and Grit Blasting.—American Steel Abrasives Co., Galion, Ohio. Booklet presenting "15 facts for the foundry and forge shop" on shot and grit blasting in foundry work.

Oxwelded Industrial Piping.—Linde Air Products Co., 30 East Forty-second Street, New York. Illustrated pamphlet upholding the proposition that it is better to construct pipe lines of stock lengths and welded joints than to rely upon threaded joints, malleable fittings and specials.

Ohmmeters.—Roller-Smith Co., 233 Broadway, New York. Bulletin 300 of eight pages, illustrated, describing several types of ohmmeters, some of which are portable, and lists the prices for various instruments and attachments.

THE IRON AGE

VOL. 122, No. 7

Dodge Electrifies Heat Treatment

Over Sixty Modern Furnaces
Required to Harden and Temper
Motor Car Parts—One Battery
Handles 450,000 Pounds of
Rough Forgings Daily

H EAT treating operations on parts used in the manufacture of motor cars by Dodge Brothers, Inc., Detroit, are now with only a few minor exceptions done in electric furnaces. New equipment of various continuous and automatic types includes over 60 furnaces, drawing a total current of 11,400 kw.

All carburizing is done in two types of electric furnaces, to be described fully in a later article. Among the more interesting heat treating operations in the plant, because of the methods and types of furnaces used, are the annealing and hardening of transmission gears and the hardening of rear axle ring gears, a subject worthy of treatment in the third paper of this series.

The Dodge company adopted electric furnaces with a view of improving the quality of its product, closely controlling the temperature, reducing plant maintenance, improving working conditions by cutting down smoke and heat, reducing rejections, and simplifying the automatic operations. Three years' operations by some of the furnaces are said by those in charge to have fulfilled the expectations concerning control and uniformity of the product. Maintenance costs have been materially reduced because no excessive temperatures exist in any portion of the furnace.

Dodge has two separate heat treating departments, Plant No. 1 for finished machine parts, and Plant No. 2 for forgings. The latter will be described first. Many of the heat treated forgings undergo further heat treating operations in Plant No. 1 after machine operations are completed.

Rejections in Plant No. 2 for heat treating forgings, it is stated, do not exceed 1 per cent.

No. 2 plant is particularly well arranged. The forge shop is located in a nearby parallel building and the heat treating equipment is so placed that there is a direct flow of work from the forge through the heat treat building to the machining department on the opposite side.

Unique Charging Devices

All furnaces for normalizing, quenching and drawing forgings have a combined capacity of 450,000 lb. every 24 hr. Their connected load is 7500 kw. To do this work there are 32 box type furnaces installed (20 for quenching and 12 for annealing), six pusher type furnaces for drawing and normalizing, and two pusher type furnaces for annealing gears.

Box type furnaces were supplied by the Electric Furnace Co. and are built in batteries of four. Each battery requires a floor space of 29 ft. 6 in. by 10 ft. 3 in.; the furnace hearths are each 5 ft. 6 in. by 8 ft. 6 in. As clearly shown in the head piece the cast iron door frames, structural steel members and masonry are supported on concrete piers. This places the furnace floor so high that the quenching tables do not need to be placed in pits. The outer furnace walls carry 4½ in. of brick and 13 in. of insulation; there is also 11½ in. of insulation between the individual furnaces in each battery. The hearth floor consists of three alloy plates locked at one end and an alloy steel wall

10 in. high. The floor is supported by fire brick standing between the heating elements.

Thus the metal floor and sides form an open-top trough, and heat is transmitted from the glowing electrical ribbons through the alloy bottom without much drop in thermal gradient, and from ribbons rung on the roof radiating direct. Heating elements of the T grid type are supported from the roof by brick and alloy clamps, and beneath the alloy floor they rest on fire brick.

As the parts are delivered from the forge shop, approximately 1000 lb. are loaded on a slide bottom tray slightly narrower than the furnace hearth. As shown in Fig. 1,

these trays are placed on stands at one side of an open aisle at about the same height as the furnace bottom, so the charging machines can pick them up readily. The frame of the tray is made of channel section, and has a heavy cast steel end provided with a T slot for the charging peel. Handling is done by the Alliance Machine Co. electrically operated charging machine having 3000 lb. capacity. This machine has a T shaped casting on the end of the peel which engages with the corresponding slot on the tray head and is provided with a lock. This is for lifting the weight. A screw under the peel carries a nut, a projection on the under side of which engages in a hole in the

Fig. 1.—Charging Machine Picking up a Tray Loaded with Forged Crankshafts for Heat Treatment Prior to Machining. Trays are loaded into furnaces at right and emptied by sliding bottom out from under

Fig. 2.—Rear View of Pusher Type Furnaces. Quenching baths at three near batteries; baskets for air cooling at far batteries. Note electrical control equipment on power lines immediately above each furnace.

Fig. 4.—Tube Furnace for Connecting Rod Bolts. Work is pushed through tubes and quenched without contact with outside air. Note electric transformers under furnace and simple pusher at left

sliding bottom of the tray. This is for pulling the tray bottom out from under the load.

After the charging machine makes connection with the tray it faces about 180 deg. and moves along its track to a position in front of the furnace to be charged. Both furnace doors are raised and the charger advances, pushing the hot forgings remaining on the furnace hearth out the discharge door at the back. When the new load is in place the charging machine operator switches on the motor controlling the screw, and the bottom of the tray is withdrawn, thus depositing the cold forgings in correct position on the furnace hearth. The peel is then raised, lifting the tray above the charge, and withdraws it from the furnace. Then both doors are closed.

The entire time of loading and unloading is 30 seconds, during which the drop in furnace temperature is approximately 50 deg. Fahr.

Each furnace is connected with one phase of a 220-volt, 60-cycle, 3-phase line, and takes 154 kw. when the furnace is heating up from cold. An input of 135 kw. is required to maintain operations at 1650 deg. Fahr.

As shown in Fig. 2, quenching tanks are placed immediately behind three batteries of furnaces. Hot metal pushed out of the furnace falls into a submerged basket, and is later handled by an overhead electric traveling crane. The quenching solution (a caustic solution of 10 deg. Baume) is pumped through the tanks at the rate of 1000 gal. per min. Some furnaces do not have these tanks; a basket is placed below the door and collects parts which are to be cooled more slowly.

Most of the chassis forgings are heat treated in these box type furnaces. For example, 28 axles or 40 camshafts are placed on a tray and remain in the furnace 1 hr. at 1650 deg. The tray holds 16 crankshafts, which are in the furnace 2 hr. at 1550 deg. Heating times and temperatures naturally vary with the purpose intended and the chemical composition of the steel.

All work that is quenched after heating in the box type furnace goes to drawing furnaces placed just across the aisle from the quenching tanks. Such work includes axles, crankshafts, connecting rods, spring clips, hub forgings, and flanges, gear shift levers and brake levers. Crankshafts are drawn at 1090 deg. Fahr. and are restruck under a 5000-lb. board hammer as they are delivered from the continuous furnace. Ring gears are normalized at 1700 deg. Camshafts, drive pinions, and ring gears are given only an an-

Fig. 3.—Pusher at Charging End of Continuous Normalizing Furnace. Pans of parts are lifted by tongs and overhead pneumatic cylinder

nealing operation at this stage of the process. They are cooled in the air, leaving them soft for machining. Subsequently they are carburized and hardened.

Six pusher type continuous furnaces are installed in Plant No. 2 for drawing and normalizing forgings. Four are 25 ft. in length and two for higher heats are 15 ft. in length. Two produce 5200 lb. per hr. at 1350 deg. with a power input of 430 kw. Two furnaces have an output of 5200 lb. per hr. at 1350 deg. with a power consumption of 570 kw. Each of a pair of double-chamber recuperative furnaces installed in another department to redraw crankshafts after finish machining has a capacity of 3300 lb. per hr. with two 150-kw. power zones. Two of the fur-

naces in Plant No. 2 have adjustable controls, so they can be used for either annealing or drawing.

These furnaces as shown in Fig. 3 have three alloy tracks running their length to carry alloy shoes which support trays for light forgings, or crankshafts and other larger forgings. A 5-hp. motor through a reduction gear and bell crank provides power by pushing on the shoes on the charging end. The pusher motor is actuated by a time clock so set that both doors open simultaneously. The clock closes a relay which operates the motor driven doors. The door mechanism is connected with the pusher mechanism, causing the pusher to operate one stroke, or approximately 15 in. While one charge is being pushed into the furnace at one end, another is being discharged from the opposite end.

Tube Furnace Protects Bolts from Air

Five electric furnaces are provided for heat treating miscellaneous parts of the Dodge cars. Brief notes on these are as follows:

An interesting device is shown in Fig. 4. It is a 50-kw. tube-type Hoskins furnace for hardening connecting rod

bolts. The work is put in ten troughs at the left, from which it is pushed through the tubes. After reaching heat it is discharged through the same pipes, extending down into an oil quenching tank. Thus there is no exposure to the air. Hardened bolts are then drawn to a Rockwell hardness of B-92 to 100. This Hoskins furnace has a two-zone control and a temperature of 1600 deg. Fahr.

The heads of exhaust valves of Silchrome steel, and intake valves of chrome nickel steel, are reheated in a 35-kw. continuous furnace to a temperature of 1650 deg. previous to an operation in a coining press.

A rotary furnace of 125 kw. with an 18-in. hearth is used for normalizing and hardening flywheel starter ring gears.

Rear axle hub flanges are brazed to the tubes in two 12-in. rotary hearth 110 kw. furnaces. These furnaces operate at a temperature of 1750 deg. and the work is in for 20 min.

Some castings such as flywheels, manifolds and valve stem guides are annealed in four Rockwell continuous oil-fired furnaces.

Alloys as Substitutes for Diamond Dies

Hard Tungsten Products for Wire Drawing Cost Less and Last Longer, According to German Claims

BY ALFRED DREBES*

TESTS to replace diamond dies for drawing by other materials go back to the war time when the price of diamonds constantly increased. Work in this direction led to the production of metal alloys which, while not possessing all the properties of the diamond, were suitable for the wire industry. They increased production and, through the obtaining of exact sized wire with smooth surface, improved the quality and increased the possible usefulness of the wire. Also the increasing introduction of machines making many passes affords an unusual opportunity for these materials as substitutes for diamonds. It is not too much to say that these materials have a future, not alone as substitutes for the diamond but also to replace the ordinary drawing dies made of steel and iron alloys.

In producing these artificial die materials, alloys of tungsten, titanium, iron, chromium, cerium and carbon were first investigated. It has been found that the most suitable alloy contains 75 to 95 per cent of tungsten and 5 to 25 per cent cobalt. Such alloys are produced from a mixture of tungstic acid and oxide of cobalt, powdered aluminum being used as a reaction material. The alloy is then cast into shape.

Another kind of hard metal is made by sintering hard metal alloys containing tungsten carbide with about 3 to 7 per cent carbon and metals with fairly low-melting points, such as tungsten, nickel, cobalt or iron. These additional materials do not exceed 10 per cent in amount. Also these alloys contain tungsten as the principal constituent amounting to at least 80 per cent.

Dies from these sintered and pressed materials are harder throughout than the cast material. The principal requirement for the dies is not hardness alone but absolute uniformity of the material, which must also be free from blowholes as well as uniform in other properties. Before being used the dies should be carefully examined with a magnifying glass to see if they are free from defects.

*Herborn in Hesse-Nassau, Germany.

The die opening must exhibit a highly polished surface and no roughness or else the wire will tear and crack.

The advantage of the hard metal dies compared with the diamond is, first, their decreased cost. Further, there is the constant danger of the diamond cracking during use. Compared with iron and steel dies the hard metal also offers great advantages, such as considerably increased life; also the wire remains much more exact in diameter, has a more polished and smoother appearance, and the speed of drawing can be considerably increased.

Drawing through hard metal dies is not different from drawing in diamond or steel dies. The material to be drawn should be previously well softened. The reduction should not be too light. For soft iron, brass, copper and aluminum wire a reduction of about 12 per cent is recommended. For harder wires, such as steel, bronze, hard copper and brass about 10 per cent, and for very hard wires, such as tungsten, molybdenum and nichrome, about 7.5 per cent. The first drafts after annealing can be about 2 per cent greater. The usual lubricating agents should be used and frequent cleaning of the dies during use is necessary, no great difference being recommended to ordinary practice. These hard alloy dies should be carefully polished, which may be conveniently done on a needle polishing machine.

Wages in the United States reached their highest point in 1920 with an index of 234 as an average hourly rate, using 1913 (106) as the base year, with a sharp downward trend to 1922 and after that a gradual rise, so that in 1926 wages were 129 per cent higher than in 1913. This is shown in a compilation made by the Bureau of Labor Statistics, Department of Labor, Washington, for the period 1840-1926, and published in the February number of the *Monthly Labor Review*. All lines of employment except agriculture are covered.

Studying Gas to Learn Conditions

Watching Formation of Graphite—Some of the Conditions Which Produce Rapid Driving and Much Iron Are Analyzed

BY WALLACE G. IMHOFF*

[That the color of the smoke end of the burning gases rising from the open-top blast furnace indicates the character of the metal was shown in the first instalment of this article. The second instalment carried the story forward, through tracing conditions in a particular cast of metal as a typical illustration of ideal conditions for lime combination with sulphur to form calcium sulphide. Conditions giving high production were entered into, one criterion being the fluidity of the iron and the slag, together with a high hearth temperature.—EDITOR.]

THESE conditions carried further produce a heavy, bluish purple gas. The hearth temperature has fallen much lower and the fusion zone has come down into the hearth. The temperature of the hearth has fallen so low that the iron when cast, instead of being a bright yellow color, is a cold orange. It is glistening and shining, owing to the supersaturation of carbon. When it is cast, the excess carbon in the iron, under reduced pressure and atmospheric temperature, is thrown out in the form of graphite and fills the iron runner to a depth of 4 in. The analyses of the iron and slag are given below:

IRON						SLAG					
Silicon	0.94	0.93	1.02	0.93	0.81	Silica	36.14				
Sulphur	0.033	0.033	0.036	0.030	0.030	Alumina	10.68				
Phosphorus			0.147			CaO	42.60				
Manganese			1.06			MgO	8.37				
						Fe	0.45				
						S	1.60				
Silicon	0.61	0.90	0.87	1.06	1.02	Silica	36.08				
Sulphur	0.039	0.033	0.031	0.027	0.028	Alumina	10.52				
Phosphorus			0.151			CaO	43.10				
Manganese			1.02			MgO	7.87				
						Fe	0.63				
						S	1.56				

These two sets of analyses show quite a contrast with the analyses for hot, yellow gas. The silica is 36.14 per cent, showing that the hearth is much colder. The sulphur is 1.56 instead of 2.17 per cent, another fact which verifies the statement that the hearth temperature is much lower; and the iron in the slag has risen to 0.63 per cent.

It is interesting to note that the first example for hot, yellow gas has the tendency to promote the formation of graphite by having high lime, a low fusion zone and a hot hearth. The graphite in the second case, however, comes from an entirely different cause, a decrease of hearth temperature. In the first case the iron is thick and mucky, due to the fact that the carbon has been removed in the form of graphite. In the second case the iron is thin and fluid, but is simply cold and oversaturated with carbon, due to a falling temperature. Hence when it comes out of the furnace into new conditions of pressure and temperature it is supersaturated, and therefore large quantities separate out as graphite.

In the former case, in the furnace hearth there is a tendency for the iron not to take up carbon; in the latter case, there is a tendency for the iron to take up all the car-

bon possible. The first condition supplies large quantities of carbon for the gas; the second condition takes away the carbon from the gas and holds it in the iron. The excess carbon gives a hot, yellow gas; the shortage of carbon gives a thin, cold, blue gas.

Wide Variations in Heat Value of Gas

Many other examples could be given to illustrate the conditions which produce heavy, hot, yellow gas and cold, thin, blue gas. Practical furnacemen know that there is a wide variation in the heating value of the gas from time to time, since it is necessary in some cases to fire the boilers with coal to keep up steam. This practical condition therefore indicates that there must be a change in the composition of the gas.

Studies of the reactions going on in the iron blast furnace and the gas composition, etc., have been made by S. P. Kinney, P. H. Royster and T. L. Joseph.† These investigations were carried out on a 300-ton furnace, making foundry iron, operated by the Central Iron & Coal Co., Holt, Ala.

Study of the results given in this paper shows that blast furnace gas is made up essentially of N, CO, CO₂ and small quantities of hydrogen, H. They show also not only that the composition of the gas varies across the furnace in the same plane, but that there is a variation in the gas at different planes in the furnace. The change of composition from top to bottom as given in Table II, page 8, of their study, shows an increase in the volume of CO from 28.1 per cent in the top gas to 34.1 per cent in the bosh gas, and a decrease in the volume ratio of CO₂ from 9.9 per cent in the top gas to 0.0 in the bosh gas. This shows the change of CO to CO₂.

The practical side of blast furnace gas has been ably covered by Herman A. Brassert in his paper (pages 47-54), "Modern American Blast Furnace Practice," read at the sixth general meeting of the American Iron and Steel Institute, New York, May 22, 1914. Charts showing the "Effect of Coke Rate on Analysis of Blast Furnace Gas," "Effect of Coke Rate on Production of Blast Furnace Gas," "Relation of Tons of Iron Per Day to Coke Rate," "Effect of Tons of Iron Per Day on Amount of Gas Produced Per Minute" and "Effect of Tons of Iron Per Day on Amount of Gas Produced Per Ton," are given. The gas analysis shows:

	Per Cent		Per Cent
CO	25.8	CH ₄	0.2
CO ₂	13.6	N	57.4
H	3.0		

The most significant fact, as shown in his Chart 3, is that, the higher the tonnage of iron produced in 24 hr., the lower the coke consumption to the ton. The question which immediately arises is, "What are the conditions that produce a ton of iron on 1700 to 1900 lb. of coke; how can these conditions be obtained?"

The most important ingredients of the gas are CO and CO₂. Forsythe‡ shows the percentage by volume from the top of the furnace to the bottom for each of these. There is a direct relation between the coke used, tonnage produced and gas formed. An explanation will now be offered for the conditions which give high production, low coke con-

*Metallurgical Engineer, Sixty-second Street and Allegheny Valley Railroad, Pittsburgh. This is the final of three instalments of the article, the first having appeared in our issue of June 14, page 1686, and the second, July 26, page 203.

†"Study of the Reactions in an Iron Blast Furnace." Reports of investigations, Department of Commerce, Bureau of Mines, Serial No. 2747, April, 1926.

‡The Blast Furnace and the Manufacture of Pig Iron, by Forsythe, page 189.

sumption and good gas; in other words, answer the above question.

Production depends primarily upon the rapidity of reduction of the iron ore to metallic iron and the smooth, rapid driving of the furnace. If the conditions can be discovered which control these two factors, then we have discovered the conditions which will continually produce a high tonnage with low coke consumption.

Without entering into detail, a brief discussion will be given of some of the conditions which give rapid driving. These are:

- | | |
|----------------------------|--------------------------------|
| 1. Low fusion zone | 5. Proper stove heat control |
| 2. Moderate use of lime | 6. Clean raw materials |
| 3. High hearth temperature | 7. Right burden |
| 4. Proper wind | 8. Good condition of equipment |

A low fusion zone is of prime importance in obtaining a high production of pig iron. The main cause of raising the fusion zone up in the mantle, or higher into the middle of the furnace, is continued use of cold air. Besides being a disturbing factor in the driving, cold air upsets those chemical and metallurgical reactions going on inside the furnace which gives high production. Instead of using cold air the wind should be slightly increased; this will increase the tonnage instead of decreasing it.

Too high wind will raise the fusion zone. This will be reflected in the driving and the top heat. Practice soon establishes the proper amount of wind to use. The use of cold air should be avoided whenever possible, as it eventually starts the furnace to slipping and brings about irregular driving, which lowers production.

Lime Practice Causes Some Difficulties

The proper use of lime is a difficult feature to understand in blast furnace practice. It is essential to be able to distinguish whether the furnace really needs lime, or is lean simply from being cold. The slag should always be kept fluid, other conditions being right.

With the proper hearth temperature, the lime will combine with the sulphur and the silica will be reduced to silicon and then go into the iron. A hot hearth is an absolutely essential factor for these two reactions to take place. If the fusion zone is down in the hearth, and the hearth is cold, disastrous results may be encountered if there is too much lime on the burden. There is no reserve of heat in this case and no remedy except to slow down the revolutions of the engines. This reduces production.

By proper wind is meant that volume of wind which will

give the highest production with the smoothest driving. The temperature of the hearth should be controlled from the engine room, and not by the use of cold air. Cold air is a trouble maker. If the hearth is too hot, the logical procedure is to cool it down by getting a larger tonnage, not by decreasing the tonnage. The running of a furnace by this method requires greater skill, but pays well in the increase in production obtained.

Control of stove heat is another means of raising or lowering the hearth temperature. The best practice is to use the full stove heat all the time. An average, uniform heat is the ideal; there should be no violent fluctuations. As previously stated, the cold air by-pass is a trouble maker and should be used only as a last resort. If the furnace is too hot, increase the wind slightly and get a rich return in more pig iron.

Importance of Good Raw Stock

Clean raw materials are essential, also, to maintaining high production continuously. Fine, dirty coke, or dirty limestone, if used long enough, will tighten up the stock and disturb the proper metallurgical reactions essential to high production.

Proper mixture and proper proportions of raw materials are also important in obtaining the greatest output. Too much ore on a hot furnace will make it drive fast, but care should be taken it does not drive itself cold. Too little ore will tighten the furnace up and slow down driving. The gas in the former case will change from a hot, yellow gas to a thin, blue gas; in the latter case, the gas will be a bright yellow color.

It is hardly necessary to mention the fact that all equipment must be in good working order, to obtain high production. Delays in the skip house, on the furnace, in the engine room, reduce the tonnage of iron produced in 24 hr.

Stops or shutdowns for any great length of time affect the character of the gas. When it is known ahead of time that the shutdown will be for some time, extra coke will be put in. This furnishes an abundant supply of both heat and carbon and the gas is usually a bright, yellow color when this extra coke comes down. The two prime factors in producing heavy, yellow gas are an abundance of lime and coke. With the fusion zone down in the hearth, these factors set up conditions which promote the formation of large quantities of graphitic carbon, and an abundant supply of carbon for the gas.

Educational Work for Foundry to Be Undertaken by A. F. A.

FUNCTIONS of the recently organized educational committee of the American Foundrymen's Association are outlined in a report prepared by the former president, S. W. Utley, Detroit Steel Casting Co., Detroit, and approved by the board of directors. Members of the committee will be appointed soon.

As outlined in the report, "the object of this committee shall be to originate and disseminate to engineers and manufacturers information tending to produce a better realization of the value of the foundry industry and the possible use of castings in all kinds of manufacturing processes." Its function is to be purely educational and it shall not have as its direct object the merchandising of any particular kind of casting or the creating of a specific market for any material. It will work with the various trade associations connected with the foundry industry. No direct advertising will be done, this to be left, as now, to the various individual companies, but it hoped to persuade manufacturers to include in their advertising copy information which will help to tell the story of the foundry industry.

Publicity matter will be worked up for publication by the technical press and to some extent by the daily press.

Another function of the educational committee will be to furnish speakers for technical societies and for conferences at schools and colleges. Exhibits of motion pictures of the foundry industry are suggested as a feature of this work.

Furthermore, the educational committee hopes to "impress upon the buying public that there is more to a casting than a certain number of pounds of metal; that the character of the foundry, its technical control, its engineering ability and the ability of its organization is of as vital interest as the fact that it has a cupola or a furnace. The greatest drawback to the success of the foundry industry today is the poor quality of castings turned out by the unprogressive units, and the fact that the buyer considers the product of the well organized, progressive foundry on the same plane as the others. The bringing of this realization to the purchasing public should make membership in the American Foundrymen's Association much more sought after."

Brown, Boveri Blower at Braddock

New Turbo Unit at Edgar Thomson Works Applied to
Blast Furnace of 750 Tons Daily Capacity—Cooling
Water Required Only for Oil Coolers

AT the Edgar Thomson Works of the Carnegie Steel Co., Braddock, Pa., there has recently been put into service the first blast furnace turbo-blower of Brown, Boveri design to be installed in this country. The unit was furnished by the American Brown, Boveri Electric Corporation, Camden, N. J., which holds exclusive rights in this country for the manufacture of machinery to the designs of Brown, Boveri & Co., Ltd., Baden, Switzerland.

maximum operating load was specified as 60,000 cu. ft. a minute at a blast pressure of 30 lb. gage. In service the set has shown itself capable of delivering an inlet volume of 70,000 cu. ft. a minute at 30 lb. The operating speeds are conservative, ranging from about 2100 r.p.m. when delivering 50,000 cu. ft. at 18 lb. to 2700 r.p.m. when delivering 70,000 cu. ft. at 30 lb.

From the sectional view and the view of the lower half

Longitudinal Axial Section Through Blower Unit, Showing the Five Stages. Water cooling is not used

This is one of three new blowing units at the plant, as mentioned in *THE IRON AGE* of April 5.

The unit is of the four-bearing type, and consists of a five-stage, single-inlet, uncooled centrifugal blower direct connected by a semi-flexible claw type coupling to a combined impulse and reaction steam turbine, designed to operate with steam at 225 lb. per sq. in. gage and 150 deg. Fahr. superheat, exhausting into a vacuum of 28 to 28½ in. A light baseplate extends under the exhaust casing of the turbine and the adjacent bearing pedestal of the blower, the outboard pedestals of blower and turbine being provided with soleplates.

The set was designed to blow a furnace which has a daily capacity of 750 tons of pig iron. Accordingly, the

of the casing in course of manufacture an idea may be obtained of the design, which does not use water for cooling. The only cooling water required for the set is that for the oil coolers, two of which are furnished, connected in parallel, so that either one can be cleaned without shutting down the set.

The blower rotor is handled by a special lifting device furnished to facilitate erection. There is a pressure-balancing piston mounted at the high-pressure end of the shaft. This piston balances the greater portion of the axial thrust of the blower, and also carries labyrinth glands. As can be seen from the section, the chamber after the piston may be connected to the inlet branch of the blower, or to the atmosphere. As a result, air at atmos-

OPERATION of the Governor of the Steam Turbine End of the Unit May Be Noted from the Center Illustration. For ease in tracing the functions of the mechanism the governor is shown misplaced, at right of the turbine

THE upper half of the casing, as cast and machined, is shown below, and the lower half of casing in position, with rotor in place at the right. This shows the makeup of the rotor stages. A special lifting device facilitates erection handling of the rotor

spheric pressure only is back of the shaft-sealing glands, and leakage is slight.

At the extreme right of the shaft are the three thrust collars, which maintain the rotor in alinement, and take up any thrust not balanced by the piston. One illustration shows the rotor in place in the lower half of the casing. Surrounding the impeller wheels can be seen the curved diffuser blades through which the air passes before being directed into the inlet of the next impeller.

Perhaps the most striking feature of the turbine is the speed-governing device. In the illustration the governor shaft has been misplaced to the right, for ease in tracing the functions of the mechanism. The vertical governor shaft *B* is worm-gear driven from the turbine shaft *A*. Oil under pressure for lubrication and for actuating the turbine nozzle valves *M* is supplied by the gear oil pump *H* mounted on the lower end of the governor shaft. The oil under pressure for governing is drawn through an adjustable needle valve *K*. The movement of the spring-loaded nozzle valves is dependent upon the oil pressure in the oil pipe *L*. This oil pressure is controlled by the governor by-passing more or less oil from the oil pipe *L*, decreasing or increasing the oil pressure under the nozzle valves.

Through the throttling action of the needle valve *K* the oil pressure in the governing system can vary without affecting the pressure in the lubricating system. Oil by-passed by the governor lubricates the governor shaft mechanism.

The arrangement is such that the turbine cannot be started before oil pressure is available to the bearings, nor before sufficient pressure has been built up thereafter to operate the nozzle valve system. In case of failure of oil pressure, either in the bearing or nozzle systems, the nozzle valves will close automatically, thereby shutting off steam admission to the turbine.

An independent over-speed safety governor *G*, by striking the arm of the trip shaft *P* turns the shaft and releases the pressure on the column of balls *S*. This trips the spring-loaded main steam valve *V*, which cuts off the steam supply to the turbine.

In addition, the set is provided with a constant-volume governor, tied in with the speed governor in such a manner that the action of the former is supplanted by the latter when in service. In connecting the volume governor, an additional pipe line is connected to the annular

chamber *D* of the speed governor. In this pipe line is placed a relay-valve whose movement is controlled by a spring-backed diaphragm. This diaphragm is actuated by the differential pressure between a straight tube and a bent tube (Pitot principle) in the blower suction line. This differential pressure is a function of the volume drawn into the blower.

Any change in the volume will, therefore, alter the position of the diaphragm, and, consequently, the oil relay valve. More or less oil is by-passed by the valve, and, therefore, the oil pressure in the line *L* is varied, changing the position of the nozzle valve to admit more or less steam, thus varying the speed of the set. The diaphragm-relay unit, with a small amount of piping, is all that appears on the machine floor.

For slowing down the set when making a check or cast, the control sleeve *E* of the speed governor may be displaced, independently of volume governor and speed governor, by means of an electric motor controlled by a push-button, requiring no change in the setting of the volume governor. The control pillar carrying the push-button is located at a convenient point for the operator.

Research Aids New England Plants

Survey of Various Industries Discloses Efforts to Solve Manufacturing As Well As Marketing Problems

THE success with which many New England manufacturers are using research methods in developing new products and new uses for old ones is shown in the first of a series of reports on "Applying Research to Production," issued by the Policyholders' Service Bureau of the Metropolitan Life Insurance Co., in cooperation with the research committee of the New England Council.

The recent survey of the uses of research in New England industry made by the Metropolitan company in cooperation with the council disclosed that many New England manufacturers have been alive to the importance of research in developing established products and in introducing new ones.

Examples are presented under the headings "Improving Present Products," "Utilizing Waste Products" and "New Products for Today's Demands."

One striking instance is furnished by the Winchester Repeating Arms Co., New Haven, Conn., which maintains physical, chemical, metallurgical and ballistic laboratories and an experimental development department. The Morse Twist Drill & Machine Co., New Bedford, Mass., maintains a development laboratory in which new and improved tools are developed and tested before being manufactured in quantity. The Max Ams Machine Co., Bridgeport, Conn., went deeply into chemical research and succeeded in developing a gelatinous preparation which could be used instead of soldering to close the tops on tin food containers.

The Scovill Mfg. Co., Waterbury, Conn., brass manufacturer, adopted three methods for improving its product: first, by maintaining a uniformly high grade of metal; second, by constantly overhauling and renewing mechanical equipment; third, through continuous development work carried on through a research laboratory. A new type of road machine was developed through research by the Highway Products Co., New Bedford, Mass. The Max Ams Chemical Engineering Corporation, Bridgeport, builds equipment for the manufacture of rayon by all processes, and maintains an experimental plant in which rayon is

actually manufactured, in an effort to develop and perfect this equipment.

The problem of utilizing waste products, New England manufacturers interviewed in this survey reported, often can be solved through research. The Rumford Chemical Works, Providence, R. I., discovered that by-products of phosphoric acid production could be made into excellent plaster building blocks. The Acme Wire Co., New Haven, found out that short lengths of wire, previously discarded, could be used as lead wire in radio condensers. The Graton & Knight Co., Worcester, through the use of research, has been able to utilize 75 per cent of its scrap. At the Winchester Repeating Arms Co. plant all wastes and scrap material and equipment are routed to a central salvage department.

Research on Market Conditions

A large number of New England manufacturers have used research methods in developing products to keep up with current market conditions. In the case of the Blanchard Machine Co., Cambridge, Mass., a by-product grew so popular that it became the principal product of that company. The Carr Fastener Co., Cambridge, Mass., developed a number of its successful products by research into market conditions. The laboratory is used by the American Writing Paper Co., Holyoke, Mass., in the development of paper for new uses. By using research to test out the insulating properties of seaweed, the product of Samuel Cabot, Inc., Boston, was developed. The Eastern Mfg. Co., Bangor, Me., has developed a device which automatically weighs paper or other material passing through the mechanism in web form. The Bigelow-Hartford Co., Thompsonville, Conn., through research, changed its products to keep up with the changing fashions in the rug industry, introducing also the first mats for "table throws." The Scovill Mfg. Co. also introduced side lines which have increased the business volume of the company and have afforded steady employment.

Old Japanese Blades as Sharp

A DEVICE for determining the sharpness and durability of a cutting edge has been patented by Prof. K. Honda. It consists of a fixture which holds the blade, edge down and strictly horizontal, upon a pile of paper strips, 1 cm. wide. A definite load (1500 gm.) can be applied to press the blade against the paper pile, and then by lever motion, the blade is drawn back and forth 2 cm. The "sharpness" is measured by the number of sheets of paper cut during this operation, and the "durability" by the number of cuts required to reduce the sharpness by 50 per cent of its original value. Such values have only a relative meaning, so it is only necessary to use one kind of paper for a series of comparisons.

Cutting by pressure alone is done by wedge action; hence the sharpness determined without drawing back and forth is a function of the angle at the edge. This angle is easily determined by pressing the edge lightly on a piece of lead; the lead is then cross sectioned and the impression measured at 400 magnifications on the focusing plate of the camera. Such impressions also show the amount of wear on an edge after testing.

Before testing, the blade is honed and then finished on a microtom polishing device, until the edge is free from feathers, and when viewed sidewise at 400 magnifications has no wavy undulations nor nicks deeper than 0.02 in.

Tests made in this way on various pieces of cutlery by the inventor, and described in Science Reports of the Imperial University, Sendai, Japan (October, 1927), are summarized in Table I.

When corrected for edge angle, these data convince Prof. Honda that the Masa-

mune swords made some six hundred years ago are superior to anything known today, both in original sharpness and durability.

Safety Razors Examined

Tests were made on a series of safety razor blades, made for experimental purposes, and having an edge angle of 14 deg. It was found that initial sharpness and durability increased up to 1.3 per cent carbon; beyond 1.5 per cent carbon the blades became too brittle. The best heat treatments and results are shown in Table II.

Studies on modern safety razor blades have also been recently published in England.¹ Several hundred examinations indicate that four types of edges are now marketed, the most common of which has a chisel cross section, with the metal near the cutting edge slightly rounded from both sides. Microscopic examination of such an edge will give very discordant results, unless a mounting fixture is used which places

as the Best of Modern Razors

the tangent plane at the very edge exactly perpendicular with the optical axis of the microscope.

Characteristics of Good Blades

Modern safety razors are usually made of 1.1 to 1.3 carbon steel strip, heat treated and sharpened. The microstructure of good blades shows globular cementite embedded in a structureless matrix; but the size and distribution of the excess cementite varies greatly. After sharpening and before etching, according to Mr. Kayser "a good blade should exhibit a perfectly straight edge under 400 magnifications, and have a Firth diamond hardness of 650 to 800." This generalization, however, is denied by other investigators. After etching, globules of cementite seem to project from the cutting edge. Desch and Roberts think that the size and uniformity of such projections are related to the ability of the razor to keep a cutting edge, but Kayser can find no such relationship.

The latter investigator believes that Prof. Honda's

testing machine is unsuitable for razor blades, because a single cut through a pile of paper slips will ruin even the best razor for shaving. The only test now known to Kayser is actual shaving. He finds that shaving never causes a good razor edge to become wavy. If it is adequately protected from corrosion, wear eventually breaks down the edge in tiny patches, and in the last stage of usefulness, cementite particles may be found protruding from the cutting edge.

As a practical works test, microscopic examination at 30 diameters of the finished edge (unetched) placed in an adequate fixture will be sufficient, because if the edge has no perceptible nicks or undulations at that enlargement, it is as good as permitted by the limit of accuracy of the grinding machinery now in use.

The time-honored practice of drawing the honed blade across the finger-nail (in the cutlery shop a soft horn is substituted) is still used by the workmen in Sheffield cutlery houses to determine the fitness of razor blades for duty.

Putting an edge on the safety razor blade is done in the following manner:

1. Rough grinding on an emery wheel.
2. Fine grinding on an emery wheel or on steel rolls. (Alternative method: honing on a flat hone.)
3. Stropping.

Final stropping is apparently what produces the slight curvature on the ground surfaces just at the edge. A straight chisel edge is likely to feather, and is also liable to be too brittle for satisfactory use.

Frequently the published literature emphasizes the fact that razor blades should be wiped scrupulously dry and kept from moist atmosphere, for it appears that corrosion is the greatest enemy of a well-made blade. One author recommends careful drying with soft linen, then washing in absolute alcohol, then oiling in acid-free light machine oil.

CEREMONIAL Swords for the Forthcoming Coronation of the Japanese Emperor Made in Tokio by Kyusuke Mori in the Old Manner, Despite the Modern Iron Siding on His Shop. (Wide World Photo). BOOK REVIEWS

Electric Heating Discussed for Commercial Executives

Electric Heating. By Edgar A. Wilcox. Pages, 469, 6 x 9 in.; illustrations, 252; tables, 129. Published by the McGraw-Hill Book Co., New York. Price, \$5.

Once in a while an author deserves a vote of thanks, and for the preparation of this second edition of a pretty good one appearing twelve years ago, this author should have one, suitably engrossed.

It undertakes to show that "the merits of electric heating are now being accorded deserved recognition." It might be said to be of more use to commercial executives and to salesmen than to purely technical readers; in other words, to market creators. Comparisons are made of the merits and limitations of fuel and electricity, and of the processes to which they may be applied with technical or commercial advantage or with relation to comfort and safety.

As most of the smaller and many of the larger appliances for electric heating depend on resistor elements, there is given a long list of factors of temperature, surface, exposure, etc., that should be considered.

The chapters on arc and resistance heating—arts that are bound to be of importance, not only in boiler making but also in shipbuilding and in steel bridge and house construction, to say nothing of repairing defective castings, is well prepared.

From metal furnaces for steel to incubators and brooders is a long jump, but the author does not neglect either. That electric heating is employed in painting, vitreous enameling and metal and chemical coating may be news to many, and they will find much of interest in this line.

Under the head of tempering of steel there are some statements that are not quite orthodox, in view of recent researches and experiments; for instance, that the rate of cooling is usually immaterial, whereas it has been shown by Weber, Frankel, Heyman and others that it is a very important factor, and that this time element depends very largely upon the temperatures employed for hardening and quenching or drawing; the same results being obtained by low hard tempering and long drawing temperature as with high temperature and short drawing period.

The chapters devoted to heating furnaces are unusually full and detailed; the limitations of fuel furnaces as regards large floor space, maintenance, labor cost, and difficulty of control with solid fuels, the necessity of auxiliary equipment, the frequent refractory repairs needed, the constant burner attention necessary for liquid fuel, and the explosive and poisonous nature, lack of availability in many industrial sections, diminishing supply and unreliability from year to year and also during cold weather, of natural gas, are pointed out.

As to the relative costs of fuel and electricity for furnace heating, the author states very properly that they are influenced by so many variables that no general comparisons can be made; the most carefully prepared preliminary estimates seldom check with the final results. He is, however, quite right in saying that such estimates are usually more correct and constant for electric than for fuel installations, provided all factors have been considered. The reasons for this statement are given on page 211.

The figures on the range of annealing temperatures for carbon steels, page 213, are hardly reliable enough for modern practice. The table of colors corresponding to temperatures should have been omitted, as no two workers have the same sense of color, and the conclusions of any one worker

vary with the amount of light in the room, and from time to time according as his eye is or is not fatigued. Today we must rely upon the pyrometer to get accurate results.

There is an excellent alphabetical index. It will probably be some time before there is a better book on this subject. If there is, it will probably be by Mr. Wilcox.

ROBERT GRIMSHAW.

Working of Canadian Labor Disputes Act

Postponing Strikes: A Study of the Canadian Industrial Disputes Act. By Ben M. Selekman. Pages, 405, 5 1/4 x 7 3/4 in.; tables, 24. Published by the Russell Sage Foundation, New York. Price, \$2.50.

This is a book in which a wealth of well chosen and timely material has been collected by experts and put together and commented on with good judgment. It is the result of observations "from the outside, looking in," and the compilers very candidly state that the conclusions reached on the subject are in some respects exactly the opposite from those arrived at in 1916. The change of base, however, was paralleled by that of the workers, who at first opposed the Canadian law concerning arbitration, and are now in favor thereof; the employers also experienced a change of heart.

The study considers the questions: Has the Disputes Act prevented strikes? What suggestions have been established by the boards for the technique of mediation and conciliation, investigation, and arbitration? What factors explain the change in labor's attitude? What has the Canadian Department of Labor worked out to prevent strikes and walkouts? What light does Canadian experience throw on the possibilities of governmental intervention in industrial disputes in our country?

The provisions of the Canadian act are laid down in considerable detail, and its operation from 1907 to 1925 tabulated and analyzed, showing that out of 640 applications in which only the machinery of the act was invoked, 431 boards sat and 536 cases were handled, over half of which were unanimous. In fact, in only 9 per cent was the strike not averted or ended. As with us, coal mining shows the largest proportion (40.7 per cent) of working days lost through strikes.

As regards administration of the act, officials in the Department of Labor constantly refused to prosecute for violations of the law; and the boards have discouraged publicity, some even excluding newspaper men from the hearings. There has been no code of industrial principles laid down or developed to govern decisions of the boards.

Complaints concerning the administration of the act have been due to: (1) Difficulty of employers and employees in agreeing as to the chairman, resulting in the Department of Labor's selecting him; usually, thought the employees, unfavorable to them. (2) The long time between establishing boards and submitting reports.

The last chapter is devoted to the significance of Canadian experience for the United States. The record "seems to point to conciliation as an excellent method of governmental intervention in industrial disputes." Its chief value lies "in the fact that it enables those intervening in industrial disputes to take a realistic view of the situation at hand."

There are two reasons for conciliation: It places upon the shoulders of employers and employees the responsibility for arriving at an amicable settlement, because whatever settlement is made must be translated into everyday prac-

tice by the employers and employees involved; and it puts the actual details of working out the settlement upon those most familiar with the technical aspect of the industry in which the dispute has arisen.

The report shows that on the Canadian railroads, where conditions are fairly stabilized, the machinery of the Disputes Act, where employed, has worked well. In the coal mines, however, it has failed. And in fine, it seems that compulsion as compared with conference and negotiation under governmental auspices is futile.

ROBERT GRIMSHAW.

1928—World's Greatest Foreign Trade Year

American Foreign Trade in 1928. Official Report of Fifteenth National Foreign Trade Convention at Houston, Tex., April 25-27, 1928. Pages 261, 6 x 9 in. Issued by the secretary, O. K. Davis, National Foreign Trade Convention headquarters, India House, New York.

Beginning with the organization meeting at Washington, D. C., in 1914, these foreign trade conventions have had a great output of high-grade literature on the development of the foreign trade of the United States. From the beginning, James A. Farrell, president United States Steel Corporation, has been chairman of the National Foreign Trade Council, and the steel and metal-working trades have been well represented at every gathering.

Secretary Davis, in issuing this 1928 volume, says that this is the world's greatest foreign trade year since pre-war time. The 48 principal trading nations of the world did \$19,482,000,000 worth of export business last year, compared with \$18,400,000,000 for 1925, which was the first year in which the world actually exceeded the pre-war volume of exports. The 1913 export total of 48 nations was about \$17,700,000,000. Thus, the figures for last year, computed in 1913 dollar values, showed a gain of \$1,782,000,000, or slightly above 10 per cent, in the course of world rehabilitation from the war.

The Houston convention, at which there were 1132 delegates, including more than 50 from 19 foreign countries, specialized on Latin-America. It was brought out that 10 nations south of Panama made a total gain in exports for the past two years of almost 20 per cent, giving South America world leadership in rate of increase in export trade. Combined purchases made by Latin-American countries in the United States exceeded \$900,000,000 and were greater than their total purchases from England, France and Germany in 1927. The Proceedings take in papers and discussions of three general sessions and three export merchandising sections. At each of the latter three phases of the problem were handled by experienced men.

Blue Book on Scrap Industry

A revised Blue Book has been issued by the National Association of Waste Material Dealers, Inc., Times Building, New York. The new publication, the first since 1923, contains 324 pages and is bound in a flexible imitation leather. In addition to the constitution and by-laws of the association, a brief history and a description of the association's activities, there are separate sections devoted to iron and steel scrap, non-ferrous metals, scrap rubber, etc.

The metal section contains the standard classification of non-ferrous scrap, printed in parallel columns of English, French and German and the classifications of the American Railway Association. There is also a classification for nickel and monel metal suggested by the association. Lists are given of chemists, assayers, testing companies and sworn weighers and assayers in the United States and other countries. Among the non-ferrous metal subjects covered in this section are tariff provisions, composition of railroad bearings, United States Navy specifications on cast gun metal,

imports and exports and a list of members dealing in non-ferrous metal scrap.

The iron and steel scrap section of the book, while not quite so complete as the non-ferrous section, gives the classification prepared by the association in conjunction with the National Association of Purchasing Agents and the Bureau of Standards. It contains tariff provisions, export and import matters, a suggested contract form for the purchase of iron or steel scrap and a list of members in this field.

There is considerable information on trade customs and specimens of suggested uniform contracts are shown. The Blue Book is much more complete with information than the first issue five years ago and provides a convenient form of reference for the buyer or seller of old material.

Quotations on Efficiency

A book, entitled "Personal and Business Efficiency," has been published under the authorship of C. A. Henderson by George H. Doran Co., New York. It has 308 pages and sells for \$2.

It might be expected that a work on the higher mathematics—say a treatise by Einstein—would perhaps be tiresome and difficult reading; but here we have a book the subject and treatment of which should but will not interest every reader concerned.

Its object is "to present systematically and without frills, yet in a non-technical way, the best practical results of study in the fields vital to the welfare of the business man himself." Says the author: "Especially there is need of one which looks upon the business man as first of all a man who, among other things, is in business."

What the author has given us is hundreds on hundreds of quotations, showing a very wide range of reading. We have the sayings and opinions of all sorts and conditions of men, from Plato to Trotzky (né Bronstein), we have Prince Henry of Prussia and Emerson, President Eliot and Henry Ford, Percy McDougall and Mark Twain, the manufacturers of Providence, R. I., and Nina Simmonds, all cited; but the author's contribution seems to have been (besides the quotation points) similar to one often cited by Montaigne.

The questionnaires at the end of each chapter may make the book more useful as a textbook for hard workers.

New Books Received

The Labor Problem. By J. A. Estey. Pages 378, 6¼ x 9½ in. Published by McGraw-Hill Book Co., 370 Seventh Avenue, New York. Price, \$3.

Economics of Consumption. By Warren C. Waite. Pages 263, 6¼ x 9½ in., illustrated. Published by McGraw-Hill Book Co., 370 Seventh Avenue, New York. Price, \$3.

Influencing Men in Business. By Walter Dill Scott and Delton T. Howard. Pages 172, 6 x 9 in., illustrated. Published by Ronald Press Co., 15 East Twenty-sixth Street, New York. Price, \$2.50.

Mineral Resources of the United States, 1925. Part I, metals, pages 768, 6 x 9¼ in. Part II, non-metals, pages 615. Published by the United States Government Printing Office, Washington. Price, \$1 each.

Commerce Yearbook, 1928. Vol. I—United States. Pages 708, 6 x 9¼ in., illustrated. Published by the United States Government Printing Office, Washington. Price, \$1.25.

Patent Office Practice. By Archie R. McCrady. Pages 387, 6½ x 9¼ in. Published by H. D. Williams Co., Ouray Building, Washington.

Mining Directory of Minnesota, 1928. By John J. Craig. Pages 229, 4¾ x 6¾ in., illustrated. Published by the University of Minnesota, Minneapolis, Minn. Price, \$1.

Technisches Hilfsbuch der Österreichisch-Alpinen Montangesellschaft. Pages 64, 5½ x 7½ in., illustrated. Published by Julius Springer, Schottengasse 4, Vienna, Austria. Price 3.60 m.

Industrial Lunch Rooms. Pages 65, 6 x 9 in., illustrated. Published by the National Industrial Conference Board, Inc., 247 Park Avenue, New York. Price, \$1.

Pumping Unit Has Manganese Steel Parts

THE American Manganese Steel Co., Chicago Heights, Ill., has developed a series of portable pumping units to meet conditions of shock, wear

a 6-hp. power plant; the 2½-in. discharge machine has an 8-hp. power plant, while the 3-in. unit has a 10-hp. power plant.

Manganese Steel Parts Are Designed to Meet Shock, Wear and Abrasion in This Portable Pump

and abrasion. There are three sizes now made, in which manganese steel has been used for shell, impeller and disks. All operate at 1200 r.p.m. The smallest size has 2-in. discharge and

A long sleeve bearing with ring oiling, and babbitted, supports the shafting, to which the impeller is press-fitted. A large oil reservoir supplies lubrication for the drive

shaft and the thrust bearing. The unit, mounted on a base plate, is connected by flexible coupling through a friction clutch to the source of power.

Electrically welded 3-in. channels form a frame, which is mounted on rubber-tired wheels, with spring shock absorbers fitted to the axle. The unit may be towed, while a leg near the towing ring supports the unit when it is stationary.

Power is applied from a Novo gas engine with satisfactory speed range. Regardless of size of unit, the chassis is uniform, having a length over-all of 9 ft. 6 in., an extreme width of 4 ft. 11 in. and a total height of 4 ft. The 24-in. wheels have a 4-ft. tread.

Capacity against a 34-ft. lift is given as 100 gal. a minute for the 2-in. unit. The 2½-in. unit is rated at 150 gal. a minute against a 34-ft. lift, while the 3-in. unit has 230 gal. capacity against a 37-ft. lift. These figures vary, of course, as the head and the length of the discharge line change.

Snagging Grinder Operates at 9500 Ft. Per Minute

A SNAGGING grinder with a speed of 9500 surface ft. per min., when equipped with 30-in. diameter wheels, having 2½ or 3-in. face, 18-in. hole and operating on 40 or 60-cycle circuits, has been placed on the market by the United States Electrical Tool Co., Cincinnati. When worn down to 24 in. in diameter, the wheel speed is 7500 ft. per min., the average speed of the 30-24-in. wheel being 8500 ft. per min. On 25 and 50-cycle circuits, 24-in. wheels with 2½ or 3-in. face and 12-in. hole, giving 9300 surface ft. per min., are recommended. The machine is furnished for 220, 440 and 550-volt, two or three-phase alternating current and 220-volt direct current.

The 15-hp. heavy-duty motor employed is rated for continuous service

High-Speed Operation, 9500 Ft. Per Min., with a 30-In. Wheel, Is a Feature. Wheel hoods are designed for speeds of 10,000 ft., per min.

at full horsepower with a temperature rise of 40 deg. C. and with momentary overload capacity in excess of 100 per cent. The machine is built to safety standards of the American Engineering Standards Committee code. The wheel flanges are keyed to the shaft and securely clamped to the wheel by cap screws. The wheel hoods are of structural steel and are designed for wheel speeds of 10,000 surface ft. per min. The doors on the safety hoods are fastened by cap screws. The wheel shaft is of nickel steel, is in one piece, and is mounted on four heavy-duty ball bearings which are carried in dustproof housings.

Ladle Gearing for Smaller Ladles

WHILE geared ladles for pouring tons of molten metal have been in use for a long time, there has been a need for a special, quick-acting gearing for ladles of from 500 to 1000 lb. capacity. Such a construction has been developed by the Modern Pouring Device Co., Port Washington, Wis.

The hardship of tilting a forked shank is done away with entirely through this mechanism. The operator stands directly back of the ladle, protected from the heat by a sheet metal shield. A steadying lever attached to the bail frame facilitates quick "spotting" of the ladle. This makes pouring with a 500-lb. geared ladle a one-man proposition.

The worm gearing is self-locking

and will hold the ladle in any desired position. After a mold is poured, it is necessary to tilt back the ladle only far enough to cut off the stream. It is not necessary to

bring it back into an upright position each time. While this geared ladle was originally designed for operation on a pouring device, it is used also on an electric crane or hoist hook if desired, and can be operated by one man.

At Either Side of the Steel Shank, A, Are Guards to Protect the Trunnions, B, from Metal Splashes. The trunnions run in roller bearings. A cut steel worm in cast steel housing and cast iron worm wheel are completely inclosed. The steadying handle is shown at top

Locomotive Axle Journal Turning Lathe

A NEW 90-in. locomotive axle journal turning lathe with double quartering and crank-pin turning attachments has been brought out by the Niles Tool Works Division of the Niles-Bement-Pond Co., 111 Broadway, New York. This machine is equipped also for turning inside and outside of journals. The arrangement for journal turning and quartering has been previously described and illustrated.

For crank-pin turning the heads, of

box tool type, are mounted on heavy bases bolted to the bed. The right-hand head is mounted on the base, to which the outside journal rest is attached. The left-hand head is mounted on an independent base, adjacent to the face plate. Both heads receive their rotation and their lateral adjustment from the quartering attachment spindles.

Capacity of these attachments for engine stroke is the same as for the quartering attachments—from 22 in.

minimum to 40 in. maximum stroke. The crank-pin heads will turn pins from 7 to 12 in. in diameter and will accommodate pins of the maximum length.

Burnishing tools with shanks to fit the tool slots in the crank-pin head tool holders are regularly furnished, to secure the desired finish after the turning operation. As illustrated, the machine is arranged to handle wheel sets with 90-deg. leads only. Increasing adoption of three-cylinder locomotives with cranks 120 deg. apart has made it necessary to provide for accommodating these wheel sets also.

Where it is required to double quarter or turn the crank pins of such wheel sets, the right-hand attachment is raised and tilted 30 deg. by means of a filler block shown at A in detail view. This filler block may be readily removed to bring the quartering frame back to position for wheels with 90-deg. leads.

To support the boring bar for quartering and the crank-pin head for pin turning, additional brackets of corresponding height are supplied. These are secured to the members used for the same operations on wheels with 90-deg. leads.

Both journals on center crank axes for three-cylinder locomotives may be turned at one setting by use of the special rest shown in the second detail view. The rest has narrow slides

At Right Is a General View of the Lathe. Above is shown the fitting for handling three-crank axles, the filler block A tilting the head 30 deg. Below is the special rest for turning both journals, on three-cylinder locomotives, at one setting

and may be interchanged quickly with the regular rest. It has power longitudinal feed from the main feed shaft, but the cross-feed is by hand.

Among improvements recently incorporated on this machine are steel wearing plates on the bed, beneath the sliding heads. These plates, which are renewable, are the means of preserving alinement between the two heads. This feature is particularly necessary in this type of tool, to insure parallel journals.

Average weekly earnings in June in representative New York State factories are reported by the States Industrial Commissioner at \$29.48, compared with \$29.19 in May. Except for March, this is the highest monthly figure so far this year, but it was exceeded by four months last year.

Business Analysis and Forecast

Record Sales of Finished Steel Likely

Bookings of First Half Indicate That Year Will Surpass
1923—Leading Consumption Lines, However, Not So Promising

BY DR. LEWIS H. HANEY

DIRECTOR, NEW YORK UNIVERSITY BUREAU OF BUSINESS RESEARCH

DURING recent months the actual demand for finished steel, as reflected in sales for current requirements has been extraordinarily large and has amply warranted the high rate of production during the first half of the year. The first chart shows the trend of the monthly tonnage of various items of finished steel sold, which together make up about 50 per cent of the total. They are sufficiently representative to be taken as indicating the general trend of steel sales with the exception of rails and tin plate. Such sales showed an upward trend in June, when they reached the highest point in that month of which we have any record.

The average sales (in tons) for the second quarter were much above those for any recent year and show but a very small decline from the first quarter. Moreover, the total for the first half year exceeds that for any year on record, and forged ahead of 1923. Since the 1923 sales in the second half were small, it seems almost certain that 1928 sales will make a new record.

The performance in various lines of finished steel, however, has not been uniform. Fabricated structural steel sales, though large, fell more than usual in June, and there is some indication that they are rounding off as building operations let up a little. On the other hand, steel sheet sales made a good seasonal increase and were probably the highest on record for the month, due chiefly to heavy automobile production. The sales of steel plates and steel castings declined quite sharply, and the production of castings much exceeded orders. The business in plates has been affected by the low level of railway equipment buying as well as by unfavorable conditions in the oil industry and ship building. Thus, even

the steel business shows signs of the prevalent spottiness.

Declining Building Activity Indicated

AS we have anticipated, building operations have begun to feel the effect of tighter money and the increased difficulty of floating securities. After rounding off in May and June, *building activity showed a declining trend in July*. There is usually some decline in that month, but this year it has been larger than normal. Construction contracts, measured in floor space, amounted to only 82,125,000 sq. ft. in July, against 93,981,000 sq. ft. in June, and our adjusted index falls to 129.5 per cent of the monthly average for 1921-26, against 130.6 per cent in June. The value of contemplated new construction in July was only \$647,683,000, against \$1,030,095,000, in the preceding month, and was actually smaller than a year ago. Building permits, too, show a similar development.

It is futile to compare building operations now with those of a year ago if the purpose is merely to draw an optimistic conclusion. In July, 1927, building was at a low ebb judged by the standards of recent years. As a matter of fact, contracts awarded last month were considerably lower than three years ago, in July, 1925; and, allowing for seasonal conditions, the July figure has been exceeded in ten months during the period since the middle of 1925.

Some evidence of the down-turn in building activity has already appeared in the bookings of structural steel. The decline in such bookings in June was a little more than usual, the figure being 303,800 tons, which compares with 311,300 tons in May. Apparently the downward trend continued in July, as trade reports concerning the orders for fabricated

structural steel last month indicate a weekly average of about 34,000 tons, against an average of 42,000 tons per week in June. Several large new projects, however, are reported to be pending.

No Early Sustained Gains in Railroad Equipment

ORDERs for railroad equipment have shown no improvement, July having been a bad month in this line of business. The number of railroad cars ordered dropped to the smallest figure for the month that has appeared in many years, with domestic sales amounting to only 307 cars, in comparison with 1459 a year ago. Frequently there is a sharp seasonal decline in freight car buying during June and July, and some good sized inquiries have recently been reported, but conditions indicate no early sustained gains. The railroads have a rather large surplus of freight cars, and car loadings were fewer in July than in June. The carriers earned only 4.17 per cent on their investment in June, which is a smaller return than was earned a year ago.

As to locomotives, domestic orders for steam locomotives amounted to only 32 in July, and, though this is a few more than were ordered in the same month last year, it represents small business. That the total foreign and domestic orders for steam and electric locomotives declined is indicated by the fact that unfilled orders were reduced, in spite of a decline in shipments.

The total demand situation, as reflected in the combined activities of the chief consuming industries, is somewhat mixed; but resembles the trend of building, in that it is large but declining. As shown in the third chart, steel production in July rose so high as probably to exceed the indicated potential demand.

SALES of Finished Steel in the Second Quarter Were Much Above Those of Any Recent Year. The total for the first half forged ahead of 1923, and 1928 sales promise a new record

BUILDING Activity Showed a Declining Trend in July. Fabricated structural steel bookings fell off in June from May

STEEL Output Rose 19.2 Above Normal in July, Against 9 Per Cent Above Normal in June, Although a Decrease of Over 3 Per Cent Usually Occurs in the Seventh Month

STEEL Production in July Rose So High as Probably to Exceed the Indicated Potential Demand. And the outlook is for a moderate decline in the demand curve

The decline in the June index of composite demand was due to a reduction in freight traffic, in building activity, in automobile production, in general manufacturing, and in mining. The gains in exports, machine tool orders, and farm purchasing power, were not sufficient to offset these declines. The demand index becomes 118.2, which compares with 119.5 in May, and 108.5 in June, 1927.

Seasonal Gain in General Demand Is Likely

THE outlook appears to indicate a further moderate decline in the demand curve, and makes it seem possible that steel production has been speeded up too rapidly. It is likely that the recent high rate of production cannot be maintained.

There is no probability that consumer activity will show any more than a seasonal gain during the next few months—probably not that much. To begin with, *building activity* is headed downward, and under the influence of tightening money, is likely to continue on the decline. The country as a whole is well ahead of a normal building program.

In the second place, there is no indication of any improvement in the position of the *railroads*. In June, both net and gross earnings fell behind a year ago, and, allowing for the usual seasonal changes that occur from month to month, the volume of freight traffic showed a declining trend in both June and July. Good crops should benefit the western roads, but the question as to grain prices and the purchasing power of the farmers is still open. The railroads have slighted the maintenance of equipment, but they have a large surplus reported to be in a serviceable condition.

The *automobile industry* has caught up with the country's requirements, and the total production and sales fell off a little more than usual between May and June. The volume is unusually high, but this business generally goes as building does, and, while no rapid slump is indicated, a gradual irregular let-up in activity will probably be necessary.

The *oil industry* is better, but is still sick. It has an overdose of fuel oil, to say nothing of too much kerosene. The value of shut-in production is enormous, and the higher prices recently established for light crude may stimulate increased output and bring on a relapse. The prospects are uncertain and at best but fair.

Thus, the demand prospects indicate some decline. Any decline will start from a very high point, and at present does not seem likely to be severe. But *tight money, affecting the supply of funds, new security issues and building operations, is bound to restrict steel requirements for a time*—how long will depend upon the promptness with which the necessary readjustments are made in the credit situation.

This general position is supported

by the July decline of 66,000 tons in the unfilled orders of the steel corporation; which decline is contrary to the usual seasonal trend.

Relative Positions of Steel and Pig Iron Outputs

AS already intimated, it is our opinion that the output of steel ingots was stepped up too much in July. The average daily production was 152,500 tons, in comparison with 144,000 tons in June. Usually a seasonal decrease of over 3 per cent occurs in the seventh month, so that the adjusted index rose sharply, becoming 119.2 per cent of normal, against 109 per cent in June and 101.3 per cent last year. This is not only extraordinary high for the season, but is above the composite demand level. *The increase in output has been at the expense of the size of order books.* It seems highly improbable that production at this rate can be maintained.

The average price of finished steel in July was the lowest since January, being only 2.321c. a lb. This compares with 2.367c. a year ago, and is only 92 per cent of the average for the last five years. Unquestionably a firming up in prices has been under way, but we cannot see the basis for a general advance. Sheets and nails, for example, are very low. Bars, too, are a little lower than normal.

in comparison with billets. But we can see no basis for anything more than a stiffening in the general level of prices and a realignment of items that are unduly low.

Pig iron production continues relatively low in comparison with steel. The average daily production decreased more than usual in July and was only 6.1 per cent above our estimate of normal. At \$17.07 the price made a new low monthly average for recent years, and was only 79.8 per cent of the average for the period of 1923-27.

The result is a sharp decline in the ratio of pig iron production to the ingot output, and this ratio is now below normal. Not enough pig iron is being produced, considering the recent rate of the steel output, and unless ingot production is rather sharply curtailed in the near future, pig iron prices are due to advance before long. It seems probable that pig iron prices will reach a little higher level within thirty days, barring some decidedly unfavorable development in general business which is not now to be foreseen.

Heavy melting steel scrap, at an average price of \$14.13 in Pittsburgh, was cheap in July, and the reduction in supply at the chief centers, together with the increased output of steel, has strengthened the market. Scrap markets will probably rule stronger through August at least.

Production of Pig Iron in First Half

The January-June Figures Shown in Detail on Facing Page
—Ferroalloy Output Relatively Large

PRODUCTION of pig iron and ferroalloys in the first half of the year, according to the American Iron and Steel Institute, was 18,686,412 gross tons. This was less than the 19,567,554 tons made in the first half of 1927 and it was also the smallest for any first half year since 1924, when 17,514,485 tons was made. The high record for the first half of a year (as well as for any half year) was 21,016,475 tons for January-July, 1923.

Separate tables cover coke pig iron, charcoal pig iron and ferroalloys.

The output of ferroalloys exceeded that of both halves of 1927.

Of the total production of pig iron and ferroalloys, 14,497,636 tons, or 79.2 per cent, was made for maker's own use. In the first half of 1927, this percentage was 76.5. Of the total output of foundry pig iron, 1,902,382 tons, as shown in the table, or 90.6 per cent, was made for sale. About 58 per cent of the ferromanganese and spiegeleisen produced was for maker's own use. This year separate figures for ferromanganese and spiegeleisen are not given.

Heavy Volume of Construction Work

WASHINGTON, Aug. 14.—More than \$4,000,000,000 have been expended for construction operations of all types in the United States since the opening of this year, according to statistics just compiled by the Associated General Contractors of America. The figures, based on actual shipments of construction materials, show the volume of operations carried on during the first seven months of this year to be 3 per cent greater than the total

recorded for the corresponding period of 1927.

The volume of work handled during July was the greatest ever recorded for that month of the year. It was last month's large volume, following the record-breaking June activities, that enabled the total for seven months to reach the high position it occupies.

July witnessed a slight decline from the lofty June level. Despite the drop, however, last month held a position topped by only August, 1927, and June of this year.

1928 January-June Output of Pig Iron

HALF-YEARLY OUTPUT OF PIG IRON AND FERRO-ALLOYS BY STATES.

HALF-YEARLY PRODUCTION OF PIG IRON BY STATES.*

Mileage Rates Will Be Opposed

Reductions Proposed by Interstate Commerce Commission

Examiners Not So Large as Pittsburgh Mills Hoped

For—Hearings to Follow

STEEL companies, particularly those in the Pittsburgh, Youngstown and Wheeling districts, are expected to oppose vigorously the recommendations of the Interstate Commerce Commission's special examiners, Howard C. Faul and C. M. Bardwell, favoring the adoption of the mileage scale of freight rates on iron and steel products. Probably few, if any, of the shippers interested in the proceedings are satisfied with the outcome. Arguments for and against various features of the Faul-Bardwell plan will be made before the Interstate Commerce Commission. A Washington dispatch to *THE IRON AGE* published last week said that the commission probably would not hear arguments until fall, in which event it may be a year at least before the mileage scale, if approved by the commission, would go into effect.

That the adoption of the mileage scale would have the effect of further localizing the manufacture and distribution of steel products, a process that was started with the abolition of the "Pittsburgh plus" method of quoting prices is the opinion of many in the steel trade. Mills in the so-called Middle district (western Pennsylvania, West Virginia and Ohio) probably will not derive sufficient advantage from the small reductions in rates to Atlantic seaboard points, such as New York, Philadelphia and Baltimore, to offset the loss of tonnage which may result from the considerably higher rates to New England.

New England Rates Much Higher

New England, except for certain northern portions, has for some time had a blanket rate of 36.5c. per 100 lb. from Pittsburgh, 2.5c. above the Pittsburgh-New York rate. Under the mileage scale, however, blanket rates would be wiped out. Boston shipments would take a rate of 40c. and some more distant points in New England would take an even higher rate. New England manufacturing interests, which were represented at the hearings held by the Interstate Commerce Commission examiners, presumably will file objections to this scale on the ground of the injury it may do to New England industry.

It is admitted on all sides that the examiners had a most difficult task in sifting the maze of conflicting opinions and suggestions presented to them. The railroads admitted that steel should take a lower rate, but

opposed changes which would reduce their revenues. The steel companies, particularly those in the Pittsburgh and nearby districts, wanted lower rates, but what was more important they did not want to disturb the relationship existing between rates from different producing points to important consuming points. In its brief filed Nov. 1, 1927, the United States Steel Corporation said:

"How the commission can arrive at a solution of their problem through the maze of conflicting suggestions is difficult to understand. To our mind no two of these suggestions can be reconciled."

Fifth Class Rates Held Unreasonable

Shippers were practically unanimous, however, in urging the unreasonableness of fifth class rates as applied to steel. They did not attack the fifth class rates as such, but took the position that steel by reason of its relatively favorable transportation characteristics and the great volume in which it moves is entitled to lower rates.

The carriers did not deny that the general level of rates on steel is relatively high if transportation characteristics alone are considered. They admitted that a substantial profit is derived from steel and that it is highly desirable traffic. Their contention, briefly, was that their profits as a whole do not afford them more than a reasonable return and that steel rates are not too high when consideration is given to the value of the service or what the traffic will bear.

The carriers also contended that the present rate level does not restrict the movement of steel and cited the fact that New England consumers buy much of their steel from Pittsburgh, though there are nearer mills with lower freight rates, and that Michigan consumers also buy much of their steel from distant mills notwithstanding the fact that closer sources of supply are available for them also.

Rates Influence Steel Marketing

All of the testimony given by steel shippers indicated that the level of rates is of much less importance than their relationship. Since the virtual abandonment of the "Pittsburgh plus" method of quoting prices in favor of delivered prices freight rates have assumed greater influence upon the marketing of steel; therefore the im-

portance of having rates properly adjusted as between competing points of production was frequently emphasized.

Pittsburgh producers, for example, contended that the application of the fifth class rates from their mills to important markets in the East and of commodity rates lower than fifth class from the Eastern producing points to these markets is unduly prejudicial to them and unduly preferential to their Eastern competitors.

Producers in the Eastern district denied that the present rate adjustment to Eastern markets unduly prefers them or prejudices the Pittsburgh producers. They point out that the evidence in support of this claim consists almost entirely in showing that fifth class rates now apply from Pittsburgh, whereas commodity rates lower by varying percentages than fifth class apply from Eastern mills, with no proof that the respective fifth class rates are not properly related.

The Jones & Laughlin Steel Corporation contended that the decision in its case with respect to freight rates to Western points did not remove its cause for complaint and that existing rates, fixed under this so-called J. & L. scale, are still prejudicial to that company and preferential of competitors in Illinois and Indiana.

Producers in the Valley group contended that their rates are not properly related to those of their competitors, particularly competitors in the Pittsburgh district.

Say Rate Revision Is Needed

The examiners in their report say that "the record leaves no doubt as to the need and desirability of a thorough revision of the rate structure." They say, "There is disclosed an utter lack of consistency and orderly arrangement, accompanied by many instances of unlawful prejudice and preference which should be removed. . . . The evidence is persuasive that, with certain exceptions, rates on manufactured steel should be on a uniform level through the territory under consideration.

"It is the commission's duty," the examiners go on to say, "to fix reasonable rates on steel. While the record does not warrant as great reductions as would result from the application of the rates proposed by the shippers, it does indicate that many of the present rates are too high. A comparison

of steel with other commodities moving at fifth class rates or lower, the large and constant volume in which it moves, its heavy loading, the almost total absence of risk in connection with its transportation and its small value per weight unit, all are persuasive that fifth class rates are not a proper basis for this commodity."

In suggesting a uniform system of rates, the examiners say that "distance is the simplest and fairest measure of transportation service. If this system is adopted it will supplant a number of less extensive rate structures, some of them resulting from the interplay of competitive forces through a long period of years in which distance has played a minor part."

Moreover, the examiners point out that a uniform system of rates once established "should not be constantly threatened by the granting of concessions from the scale in favor of certain localities or certain traffic."

Port Differentials Disapproved

Although the examiners pattern the mileage scale they recommend on the J. & L. scale now effective in Western territory, they say that "it does not appear that this scale offers an entirely satisfactory solution of the problems presented." The examiners' objection to the use of the J. & L. scale is that, if universally applied, it would result in considerable increases in present rates because of its rate of progression.

In declaring against freight rate differentials, the examiners said: "The only purpose a differential can possibly have is to create an artificial

rate situation calculated to give some community an advantage to which its geographical location does not entitle it."

No objection was made by the examiners to the retention of the present differentials on eastbound traffic as affecting Johnstown, Pa., and Cumberland, Md., but otherwise the examiners recommend that the use of differentials be disapproved. The port differentials by which New York, Philadelphia and Baltimore have had a fixed relationship were disapproved. If the recommendation of the examiners on this point is approved by the commission, the mileage rate from Pittsburgh to Baltimore would be 27c., to Philadelphia, 25c., and to New York, 33c. Under the present scale Philadelphia is 2c. and Baltimore 3c. under the New York rate. In export trade particularly, wherein rates 60 per cent of the domestic rates are applied, the advantage in favor of Philadelphia and Baltimore as against New York may be expected to bring protests from shipping interests in New York.

Decision on Grouping

One of the most difficult problems in the rate case, the examiners report, arose in connection with the subject of origin and destination groups. On this point the report says:

"Some of the present origin groups of steel producing points seem to be entirely reasonable. An example is the Valleys or Youngstown group. This group includes a number of steel producing points within an area not more than 50 miles in diameter which have been grouped for many years. The Buffalo group is another compact

group containing only six steel producing points, no two of which are more than 20 miles apart. On the other hand, some of the existing groups are impossible of justification on any theory. The origin groups in the Eastern part of trunk line territory are undoubtedly much too large, particularly as they are used in connection with comparatively short hauls. The trunk line carriers concede that these groups cannot be defended."

In this connection the situation existing among eastern Pennsylvania mills is cited. Mills at Pencoyd, Coatesville, Phoenixville, Ivy Rock and Conshohocken pay 17.5c. per 100 lb. to New York, while Bethlehem, although the same distance to New York as Pencoyd (88 miles) pays 14.5c. Under the plan proposed by the examiners the Philadelphia group would be broken up and rates would be applied on a mileage basis, with Pencoyd and Conshohocken paying 14.5c., Ivy Rock, 15c., Phoenixville, 16c. and Coatesville, 17c. Bethlehem's rate would remain at 14.5c.

In considering the Pittsburgh group, the examiners see no reason for including such points as Erie, Pa., and Jamestown, N. Y., and recommend that Ohio and West Virginia points now included in the Pittsburgh group be given a separate grouping.

Would Restrict Destination Grouping

Destination groups, it was stated, do not seem to rest upon as logical grounds as do origin groups. Some of the shippers favored reasonable destination grouping if it can be accomplished without discrimination.

(Rates Are Shown in Cents per 100 Lb.)

The retention of the present large destination grouping in New England in connection with comparatively short hauls was not advocated by either shippers or carriers. The strongest criticism of destination grouping in the hearings was directed against the establishment of the group rates from Chicago to Illinois

destinations under the J. & L. scale. The examiners recommend on this point that no origin grouping be authorized in connection with hauls of less than approximately 150 miles, except as otherwise provided, and that no destination grouping be authorized in connection with hauls of less than approximately 450 miles.

The exception is that this would not prohibit the grouping of points located within a single switching district or in the industrial community immediately surrounding such district, nor would it prevent the grouping which would naturally result from the application of the distance scale.

Pittsburgh Objects to Fifth Class Rates—Approves Lower Rate to St. Louis

PITTSBURGH, Aug. 13.—Steel company traffic managers have had an opportunity to study the report of Examiners Howard C. Faul and C. M. Bardwell of the Interstate Commerce Commission and their recommendations for iron and steel freight rates for the northeastern part of the country. Although viewed strictly as a proposal that is likely to be revised before any new rates are ordered into effect, a feeling of disappointment that Pittsburgh did not get as much as it had asked is tempered by the fact that the proposed rates do take a definite step in the direction of modifying some of the inequalities, based upon the mileage principle, that had

been the basis of complaint by Pittsburgh district producers. The point is made that the rate from Pittsburgh to Chicago remains at 34c. per 100 lb. This is the fifth class rate between those points and, in its retention, it is seen that requests for a commodity rate went unheeded. On the other hand, the rate from Pittsburgh to St. Louis is to be lowered from 40½c. per 100 lb. to 39c. and that from Chicago to St. Louis is to be advanced from 22c. per 100 lb. to 25c., the differential in favor of Chicago over Pittsburgh being reduced to 14c. from 18½c. With Chicago mills quoting most products 10c. per 100 lb. higher than Pittsburgh, the

proposed rate to St. Louis would make it necessary for Pittsburgh mills to absorb only 80c. a ton to equalize the delivered price of Chicago mills, compared with \$1.70 under existing tariffs. The accompanying compilations compare present rates with those proposed from the principal producing centers to typical consuming centers. The new rates to the several New England points are assumed ones, since it is expected that, as the new rates have been worked out on a mileage basis, there will be different rates to the different destinations, instead of a common rate to all points in New England as at present.

(Rates Are Shown in Cents per 100 Lb.)

Corporate Profits Appear Stabilized

Total for All Corporations Close to \$7,000,000,000 Annually for Three Years—Manufacturing Profits Less in 1927

RECENT profits of corporations have been analyzed by the Harvard Economic Society from data furnished by the Commissioner of Internal Revenue, Washington. From a net deficit in 1921 there has been recovery until the last three calendar years have shown a practically uniform total approaching \$7,000,000,000 each year. The figures, together with those for manufacturing corporations, as distinguished from all other, are shown in the table. In the Harvard study mining, transportation, public utility, trading and financial corpo-

herewith has added to it the figures for manufacturing corporations.

It is pointed out that recent profits are more substantial than would be indicated by merely their size. The value of the dollar has much increased with the fall of prices since 1921. Profits are not now tied up in high-priced inventories, as was the case immediately after the war. Taxation is lower from Federal sources and thus a larger portion of the operating profits becomes available for dividends.

Stability of profits of the past few

Manufacturers Did Not Hold Their Profits So Well in 1927 as Did Other Corporations. Even so, 1925 to 1927 Showed Slight Fluctuation

rations were covered also, together with estimates for the farmers and for partnerships and sole proprietorships in business activities.

While the original diagram showed only the overall figures, the diagram

years is indicated by the fact that no one of the last three shows a variation of much more than 1 per cent from the average of the three. This is in contrast with the preceding period, in which variations from year

to year were from 30 to 40 per cent, even exempting the drop in 1921 of more than 100 per cent.

Two distinct cycles appear from the curves, one ending in the depreciation of 1921, while the other is still in its prosperity phase. The setback of 1924 appears moderate. As a matter of fact, profits that year were the third largest to that date since the war, being more than 10 per cent ahead of 1920, which through a large portion of its course was regarded as a boom year.

Profits of Corporations in Millions of Dollars

Year	All Corporations	All Manufacturing Corporations
1919	6,419	3,493
1920	4,468	2,337
1921	—55	—473
1922	4,380	2,331
1923	5,827	3,174
1924	4,998	2,417
1925	6,971	3,246
1926 (a)	7,050	3,240
1927 (a)	6,900	2,990

(a) Preliminary figures.

All the figures given are based upon the amounts reported by the corporations for income tax purposes. They would not tend to overstate the amount of corporate profits. They are net in a double sense: They represent profits after all expenses, including depreciation, depletion, interest, and Federal and other taxes; they represent profits of corporations in the aggregate, after allowing for deficits of all corporations losing money, though still going concerns. Intercompany dividends are excluded.

Coke Production in June 5 Per Cent Below May

WASHINGTON, July 31.—Due to a decrease of 3 per cent in the daily output of pig iron there was a slight decline in the production of coke during June, which dropped to 4,263,268 net tons, as against 4,475,864 tons in May, according to the Bureau of Mines. Beehive coke daily production fell off 16.6 per cent to 11,615 tons from 13,926 tons, while the daily output of by-product coke declined 0.2 per cent to 132,042 tons, from 132,254 tons.

For the six months ended with June total production of coke was 25,941,536 tons, against 26,532,075 tons for the corresponding period of last year. Production of by-product coke showed an increase of 7 per cent in output, with a total of 23,671,536 tons during the first half of 1928, compared with 22,113,075 tons for the first six months of 1927. Beehive coke production, on the contrary, showed a decline of more than 48 per cent, decreasing to 2,270,000 tons from 4,419,000 tons.

Of the by-production during the first six months of 1928, ovens in Pennsylvania, the Buffalo district, Ohio and adjacent plants made 12,-

347,799 tons; 2,255,710 tons were made in Alabama and Tennessee ovens and 6,054,730 tons in ovens in Illinois, Indiana, Michigan and Missouri.

With production of by-product coke in 1927 aggregating 43,884,726 tons, valued at \$232,043,803, figures just issued by the bureau show that 30,687,198 tons, valued at \$145,123,216, was used by the producers in blast furnaces, etc., while 3,761,864 tons, valued at \$20,448,285, was sold for furnace use and 1,938,653 tons, valued at \$15,112,967, was sold for foundry use.

Dry Cleaning of Blast Furnace Gas

Cleaning of gas from blast furnace operations without the use of water was described and illustrated in an article by George B. Cramp, which appeared at page 1111 of THE IRON AGE, Oct. 25, 1923. This method has now been taken up by the Gas Cleaning Engineering Corporation, 320 Broadway, New York, in addition to wet cleaning and other processes. The company has been organized to design and supervise the construction of general gas cleaning equipment.

Briefly, the method adopted is to pass the gas through a filter of flue dust, in which the dirt from the gas is entrapped. It is claimed that this method gives much cleaner gas than is obtainable by the wet method so long in vogue. At the same time it avoids cooling the gas and thereby saves much of its heat for use in hot blast stoves or under boilers. The design of the apparatus is tied up largely with questions of gas velocity to give best results. The cleaning is said to be adequate to fit the gas for burning without any further attention.

Among the advantages claimed are elimination of the high cost of maintenance experienced in wet washed gas apparatus and of the equipment and cost of pumping water. The first cost of the apparatus is said to be not much greater than that of the combination dry and wet apparatus so largely used. It is claimed that the dry cleaner will pay for itself by savings within three to five years.

The Concrete Reinforcing Steel Institute will hold its fall meeting at Shawnee-on-Delaware, Pa., Oct. 1 to 3.

Steel Treaters Announce Technical Program

Technical papers for the annual meeting of the American Society for Steel Treating, to be held in Philadelphia, Oct. 8 to 12, are announced as follows:

"Austenite Decomposition and Length Changes in Steel," by E. C. Bain and Willis S. N. Waring.

"The Cutting Qualities of an Alloy Steel as Influenced by Its Heat Treatment," by O. W. Boston and M. N. Landis.

"Metallurgical Problems of Transmission Gearing," by E. F. Davis.

"Methods of Approximating Certain Physical Characteristics of Nitrided Steel Cases," by G. M. Eaton.

"The Equation of the Carbon Time Curve in Basic Open-Hearth Refining and Prediction of Carbon Drop," by A. L. Feild.

"Surface Cooling of Steels in Quenching," by H. J. French, G. S. Cook and T. E. Hamill.

"High-Carbon, High-Chromium Steels," by J. P. Gill.

"Some of the Characteristics of Pearlite in Eutectoid Rail Steels," by O. V. Greene.

"On Oxygen Dissolved in Steel and Its Influence on the Structure," by M. A. Grossman.

"The Solubility of Carbon in Normal and Abnormal Steels," by Dr. O. E. Harder and Willard S. Johnson.

"Cloudburst Process for Hardness Testing and Hardening," by Edward G. Herbert.

"Deoxidation of Steel with Silicon," by C. H. Herty, Jr., and G. R. Fitterer.

"The Surface Hardening of Special Steels with Ammonia Gas Under Pressure," by Raymond H. Hobrock.

"On the Nature of Martensite Crystals," by Kotaro Honda.

"The Influence of Nickel on Combined Carbon in Gray Iron," by J. R. Houston.

"A New Tool Material," by Dr. S. L. Hoyt.

"A New Method for Heat Treating High Speed Steel," by H. C. Knerr.

"A Study of the Constitution of High Manganese Steels," by V. N. Krivobok.

"An Investigation of the Physical Properties of Certain Chromium-Aluminum Steels," by F. B. Lounsbury and W. R. Breeler.

"Depth and Character of Case Induced by Mixtures of Ferroalloys with Carburizing Compounds," by E. G. Mahin and R. C. Spencer.

"A Melting Record of Three Acid Open-Hearth Heats," by C. E. Meissner and W. E. Griffith.

"Service Annealing of Sling and Crane Chains," by W. J. Merten.

"Stainless Iron and Its Application to the Manufacture and Transportation of Nitric Acid," by W. M. Mitchell.

"Progress Made in the Use of Electric Furnaces for Heat Treating," by A. N. Otis.

"Chromium-Copper Steels as Possible Non-Corrosive Ferrous Alloys," by B. D. Saklatwalla and Albert W. Demler.

"Graphitization in the Presence of Nickel," by H. A. Schwartz.

"Heat Treatment of High Speed Steel to 2400 Degrees Fahr., in Molten Lead," by W. C. Searle.

"Steel Failures in Aircraft," by F. T. Sisco.

"On the Equilibrium Diagram of the Iron-Molybdenum System," by Takeshi Takei and Takejiro Murakami.

"The Torsional Modulus of Carbon Steel, Phosphor Bronze, Brass and Monel Metal," by William P. Wood.

"Decarburization of High Carbon Steel

in 'Reducing' Atmospheres," by J. J. Curran and J. H. G. Williams.

"Application of Normalized Steels to Crankshafts and Other Automotive Parts," by H. T. Chandler.

"The Effect of Furnace Atmospheres on Steels," by R. G. Guthrie.

"Nature of Dendrites," by H. G. Keshian.

"Chromium in Silicon-Manganese Steels for Engineering and Structural Application," by A. B. Kinzel.

No title suggested—by F. F. Lucas.

"Selection of Steels for Ford Industry," by J. L. McCloud.

"Chromium Iron and Nickel Chromium in Dealing with Corrosion and Heat Resistance," by T. H. Nelson.

"A New Development in Corrosion-Resisting Steel," by Frank R. Palmer.

"The Manufacture of Acid Open-Hearth Steel for the Production of Forging Ingots," by H. P. Rassbach.

"Importance of Technique in Polishing and Etching Difficult Materials," by Mr. Villella.

The tentative program for the Institute of Metals was published in THE IRON AGE, July 26, page 254.

Hotel Benjamin Franklin will be the headquarters of the steel treaters and the Institute of Metals, while the Bellevue-Stratford will be the headquarters of the American Welding Society during National Metal Week. All morning technical sessions will be held at the respective hotel headquarters of each society, the afternoon sessions assembling at rooms in the Commercial Museum, where the National Metal Exposition is to be held.

The annual banquet of the steel treaters will be held at the Benjamin Franklin Hotel, Thursday evening, Oct. 11.

Institute of Metals to Meet in Liverpool

The autumn meeting of the Institute of Metals will be held in Liverpool, England, from Sept. 4 to 7. The seventh autumn lecture is to be delivered by F. G. Martin on "Non-Ferrous Metals in the Shipping Industry." The following technical program has been arranged:

Laboratory Experiments on High Temperature Resistance Alloys, by C. J. Smithells, S. V. Williams and J. E. Avery.

Corrosion at Discontinuities in Metallic Protective Coatings, by U. R. Evans.

Constitution of the Alloys of Aluminum with Copper, Silicon and Iron, by A. C. C. Gwyer, H. W. L. Phillips and L. Mann.

Copper-Magnesium Alloys. Part III, by W. R. D. Jones.

Note on Practical Pyrometry, by G. B. Brook and H. J. Simcox.

Eighth Report to the Corrosion Research Committee. The Corrosion of Condenser Tubes. "Impingement Attack": Its Cause and Some Methods of Prevention, by R. May.

Rockwell Hardness Test, by J. E. Malam.

Die-Casting Alloys of Low Melting Point, by T. F. Russell, W. E. Goodrich, W. Cross, and (in part) N. P. Allen.

Work-Softening of Eutectic Alloys, by F. Hargreaves.

Die-Casting of Copper-Rich Alloys, by R. Genders, R. C. Reader and V. T. S. Foster.

Alpha Phase Boundary of the Copper-Silicon System, by C. S. Smith.

Properties and Production of Aluminum Die-Castings, by S. L. Archbutt, J. D. Crogan and J. W. Jenkins.

Methods for Investigating Alloys of Reactive Metals, by W. Hume-Rothery.

Strength of a Cadmium-Zinc and of a Tin-Lead Alloy Solder, by C. H. M. Jenkins.

Note on the Treatment of Aluminum and Aluminum Alloys with Chlorine, by D. R. Tullis.

Manufacturers Donate to Byrd Expedition

Manufacturers and dealers have been generous in donating to the South Pole expedition headed by Commander Richard E. Byrd, which gets under way this month. Goods valued at approximately \$500,000 have been given. Some of the manufacturers who have contributed supplies are:

Air Reduction Sales Co., New York, acetylene outfit.
American Screw Co., Providence, R. I., machine screws.
Armstrong Brothers Tool Co., Chicago, machinists' tools.
Bethlehem Steel Co., Bethlehem, Pa., steel.
Bridgeport Hardware Mfg. Co., Bridgeport, Conn., nail pullers.
Brown & Sharpe Mfg. Co., Providence, R. I., machine tools.
Carborundum Co., Niagara Falls, N. Y., grinding wheels.
Cleveland Twist Drill Co., Cleveland, drills.
Corbin Screw Corporation, New Britain, Conn., machine screws and nuts.
Thomas L. Dickenson, New York, emery wheel dresser.
Henry Disston & Sons, Inc., Philadelphia, files.
William Dixon, Inc., Newark, N. J., belt dressing.
Goodell-Pratt Co., Greenfield, Mass., bearing scrapers.
Greenfield Tap & Die Corporation, Greenfield, Mass., taps and dies.
Thomas Laughlin Co., Portland, Me., marine hardware.
David Maydole Hammer Co., Norwich, Conn., hammers.
Peck, Stow & Wilcox Co., Southington, Conn., tools.
Reed Mfg. Co., Erie, Pa., vises.
John A. Roebbling's Sons Co., Trenton, N. J., wire.
South Bend Lathe Co., South Bend, Ind., large lathe.
L. S. Starrett Co., Athol, Mass., machinists' tools.
Union Twist Drill Co., Athol, Mass., milling cutters.
Walworth Co., Boston, wrenches.
J. H. Williams & Co., Buffalo, drop forged tools.

Smaller Accident Rate at Metallurgical Works

Accidents at non-ferrous metallurgical works in 1926 were at the smallest rate on record. The figure was 110.8 for each thousand 300-day workers, compared with 116.4 in the preceding year and with an average of 142.2 in the 13 years, 1913-1925 inclusive. Fatal accidents showed a slight increase in 1926 over 1925, but otherwise were at the smallest rate ever recorded. They were 0.73 for each thousand 300-day workers, compared with 0.66 in 1925 and with an average of 1.04 in the 13 years preceding 1926.

Reduction in the accident rate below the 13-year record was 23.1 per cent; in the fatal rate the reduction was 29.8 per cent. Comparing 1913-1918 inclusive with 1919-1926 inclusive, the accident rate dropped from 151.0 to 131.7, or 12.8 per cent. Mean-time the fatal accident rate dropped from 1.21 to 0.88, or 27.6 per cent.

Seasonal Shrinkage in Coal Stocks

Stocks of bituminous coal in industrial hands on July 1 are reported by the National Association of Purchasing Agents at 39,855,000 net tons, compared with 40,890,000 tons on June 1. This continues the steady decline from the peak of 60,154,000 tons, on Oct. 1, 1927. Consumption in June is estimated at 32,521,000 tons, compared with 34,844,000 tons in May, and was the smallest for about a year. Production in June is placed at 41,264,000 tons, compared with 44,748,000 tons in May and, with the exception of April, the smallest in more than a year.

Supplies in various industries are estimated, at an average, for 37 days consumption. This includes 41 days for steel mills, 35 days for railroads, 67 days for electric utilities and gas plants, 19 days for by-product coke plants and 37 days for other industries.

Fewer Iron and Steel Workers

Employees in 194 establishments making iron and steel were 0.8 per cent fewer in June than in May, according to a report of the United States Bureau of Labor Statistics. The respective numbers were 263,452 and 261,302, representing identical establishments. Payrolls in those two months showed a drop of 3.7 per cent, indicating a pay envelope about 3 per cent lighter in June. The respective dollar values for one-week in each month were \$8,413,329 and \$8,104,362.

In 968 establishments devoted to foundry and machine shop products there was an increase of 0.5 per cent in number of wage earners and of 1.3 per cent in total payroll. Employees advanced from 237,474 to 238,643 and payrolls for one week from \$7,172,944 to \$7,268,951.

Machine tool plants to the number of 148 reported a gain of 1.7 per cent in number of employees and of 2.2 per cent in payroll total. Hardware establishments numbering 68 showed a gain of 0.7 per cent in employees and 2 per cent in payroll. Structural iron workers increased 2.8 per cent in number and 1.8 per cent in total payroll. Cast iron pipe foundries to the number of 39 showed an increase of 0.3 per cent in employees, but a decline of 7.5 per cent in amount of payroll.

Taken as a group, iron and steel and their products showed an increase of 0.1 per cent in number of employees and a decrease of 0.9 per cent in amount of payroll. Other metal products showed a decrease of 0.6 per cent in employees and 1.2 per cent in payroll.

Industrial Engineers to Meet in Rochester

"Profitable Prosperity, a Practical Program for Cutting Costs and Raising Profits," will be the general theme of the fifteenth national convention of the Society of Industrial Engineers, which will be held at Rochester, N. Y., Oct. 17, 18 and 19. The meeting will be held jointly with the industrial management council of the Rochester Chamber of Commerce and the sessions will be in the rooms of the chamber of commerce and at the Hotel Seneca. George C. Dent is executive secretary of the society, the headquarters of which are at 205 West Wacker Drive, Chicago.

Heavy Production of Petroleum Continues

Production of crude petroleum in the United States in June is reported by the Bureau of Mines at 75,681,000 bbl. of 42 gal., compared with 77,311,000 bbl. in May and with 67,697,000 bbl. in June last year. Totals for the six months are given as 431,889,000

bbl. in 1928 against 405,460,000 bbl. last year, representing an increase of about 6.5 per cent.

Although June showed a reduction from May in total, there was an increase of more than 1 per cent in daily average for the shorter month.

Imports in June were 6,553,000 bbl., compared with 6,766,000 bbl. in May, and exports were 1,879,000 bbl., compared with 1,493,000 bbl. in May. Figures for production are runs from stills.

Creosoted Wood Block Floors Increase in Demand

The use of treated wood block floors in the United States in 1927 increased 28 per cent over the previous year, according to figures prepared by the United States Forest Service in co-operation with the American Wood-Preservers' Association. A total of 13,853,817 sq. ft. of these blocks treated with creosote or creosote-coaltar paving oil was laid in 1927. The reason given for the increasing demand for floors of this kind is the desire for permanence, resilience, and high wearing qualities, especially in factories, machine and printing shops, foundries, etc., where heavy trucking is required.

Increase in Graphite Output

Graphite (plumbago or black lead) produced in 1927, was valued at \$2,931,584, or 14 per cent more than the 1925 value of \$2,569,487, according to data collected in 1928 at the biennial census of manufacturers by the Bureau of Census from 13 establishments (11 in 1925) engaged primarily in extraction from the ore and refining of graphite.

Two of the establishments in 1927 were located in Illinois, two in Michigan, two in New Jersey and two in Pennsylvania. The other five were in Alabama, California, New York, Ohio and Texas.

Comparison of First Half Earnings of Leading Steel Companies Over Three Years (In Thousands of Dollars)

European Export Trade Improving

British Business Small But Inquiry Is Good—Payment of Reparations in Material Causes Concern to French Mills

(By Cable)

LONDON, ENGLAND, Aug. 13.

IRON and steel demand is still under the influence of the holidays and business is small. Cleveland producers of pig iron are maintaining prices firmly, as output is restricted, but hematite makers are seeking to dispose of stocks.

Foreign ore is quiet. The Swedish miners' strike has ended, but the general situation in ore is unlikely to be affected for some months, as most consumers are fully covered to the end of the year.

Finished iron and steel is generally quiet, especially in demand for heavy ship material for export, but inquiry is improving. July export of pig iron was 30,957 tons, of which only 50 tons went to the United States. Exports of iron and steel were 333,079 tons.

Tin plate mills have resumed operation following the holidays, with good order books for October to end of the year, but some August-September tin plate is still obtainable at lower prices. Makers are confident that demand will be renewed as current inquiries promise some good business. Galvanized sheets are generally quiet except for steady sales of small lots which have imparted a steadier tone to prices. Black sheets continue quiet.

Continental iron and steel prices are strong with makers well booked with tonnage, but current business slack. Purchases of Continental material by British users have been negligible, as a result of the holidays.

Polish production from April to June was 55,000 tons of pig iron, 118,000 tons of steel ingots and 83,000 tons of rolled steel products.

it would increase the annual domestic output by about 4,000,000 tons is considered by German producers as questionable.

Reports in London of impending negotiations between Germany and Great Britain toward an agreement on pig iron are denied. It is stated here that the most that can be expected is an informal discussion as the British have no pig iron association or syndicate qualified to enter a binding agreement with any competitor. The recent appeal of Premier Baldwin for an international understanding is regarded as a political move to offset temporarily the persistent demands of the tariff advocates in his own party. No new negotiations have taken place toward admitting Britain to the International Steel Cartel.

Prospects of an agreement between Great Britain and Germany on pig iron have not been improved by the threatened increase of competition in coal. The Ruhr Coal Syndicate has again been aroused by British competition in the so-called "competitive districts" of Germany. In May, the syndicate resolved to withdraw in part from these "competitive districts" and leave them to Britain and Poland, but in June the decision was reversed and the syndicate reentered these districts with considerably increased sales. However, the British Government has now decided to antedate its already

Anglo-German Cartel Not Expected

Pig Iron Agreement Requires British Syndicate—British Coal Competition Stirs the Ruhr

BERLIN, GERMANY, Aug. 1.—Producers here continue to regard the increasing agitation of the British conservative party for a safeguarding duty on iron and steel as of little importance. It is pointed out that Germany, despite a tariff on iron and

steel, is a considerable importer of pig iron, steel and rolled products and that recently British imports of pig iron and steel have declined, but there has been no corresponding increase in home production. The argument of the proponents of a British tariff that

British and Continental European prices per gross ton, except where otherwise stated, f.o.b. makers' works, with American equivalent figured at \$4.86 per £ as follows:

announced plan for reducing railroad freight rates. This plan gives British export coal an advantage that is interpreted in Germany as an indirect bounty. It will also cause the syndicate considerable financial loss unless the Ruhr producers withdraw from the "competitive districts," where selling can only be at a loss.

Domestic steel business is slightly quieter, with only high grade steels for the automotive industry in heavy demand. Engineering plants and other manufacturers report a decline in new orders and delivery terms have become shorter.

Export trade has improved and the Stahlwerksverband has advanced its prices. Quotations in foreign markets on wire rods and wire products, however, are unchanged. Exports to the United Kingdom, Holland, South American markets and India are active. Foreign demand for semi-finished material and bars has increased. Price rebates of the steel syndicate for August have in some cases been increased, while on other products

they have been reduced. The "world market" prices established by the syndicate for August are: Steel ingots, 81.50 m. (\$19.40) per metric ton; blooms, 86.50 m. (\$20.60) per ton; billets, 93 m. (\$22.14) per ton; shapes, 95.50 m. (\$22.74) per ton; steel bars, 113.50 m. (\$27.02) per ton, and wire rods, 120 m. (\$28.57) per ton.

A loose combination of works of the class known as "Arbeitsgemeinschaft" has been negotiated among the locomotive builders, including the Henschel works at Cassel, Borsig at Berlin, Tegeler Maschinenbau A. G. at Berlin and I. Maffei at Munich. The principal purpose of the new combination is given as an effort to further technical progress in locomotive building. Business in locomotives shows no evidence of improvement. In the past few years the Railroads Corporation has bought only about 100 locomotives a year and these had to be distributed to 20 different German builders. Recently the Maffei works at Munich booked an order for 22 locomotives from the Indian railroads.

Belgian Market Activity Promises Well for Fall

BRUSSELS, BELGIUM, July 29.—Iron and steel prices have been quite firm during the past 10 days, with many orders placed which were withheld during the Antwerp dock strike. This recovery of the market at a usually dull season is regarded as promising well for conditions in the fall.

Considerable railroad business has been booked and a contract for 35,000 tons of rails for the National railroads is pending in addition to some desirable export tonnages of railroad material for India and South American markets. Pig iron prices are firm despite French and British competition. Export quotations on steel per gross ton, f.o.b. Antwerp, are: Blooms, £4 12s. 6d. to £4 13s. 6d. (\$22.48 to \$22.72); slabs, £4 17s. to £4 17s. 6d. (\$23.57 to \$23.69); steel bars, £5 15s. to £5 16s. per ton (1.27c. to 1.28c. per lb.); wire rods, £6 per ton (1.32c. per lb.). Most prices are firm with an upward tendency.

Production of pig iron in June was slightly smaller than in May, but steel ingot and rolled products output showed a slight advance. Pig iron production was 321,030 metric tons, compared with 328,810 tons in May; steel ingot output 319,650 tons, compared with 316,210 tons in May, and production of rolled products 291,750 tons, compared with 276,250 metric tons in May.

German Metal Goods by Ships to Siberia

HAMBURG, GERMANY, July 28.—Following its successful trading voyage to Siberia last year, "Derutra," a company owned by German and Russian capital, is sending a fleet of eight ships, accompanied by two Russian ice breakers, to Siberia, via Archangel. The ships carry cargoes of agricultural machinery, metal goods and hardware of all kinds. They will sail up the Yenisei River, where their products will be exchanged for Siberian products. In this way most of the requirements of central Siberia for metal goods and machinery can be supplied by German industry. Last year the fleet consisted of four vessels, which sailed about this time and returned toward the end of September.

New Alloy Steel Works Established in France

PARIS, FRANCE, July 30.—A new steel plant has been established by German interests at Labuissiere under the name of Societe Anonyme des Fonderies de Labuissiere. Its principal production will be alloy and stainless steel and high quality steel tubes, a large proportion of which have been imported in the past from Great Britain and Germany.

Reparations Menace French Industry

German Payments in Kind Used in Extensive Projects Which Do Not Benefit French Makers

PARIS, FRANCE, Aug. 1.—German payment of reparations in materials is causing some uneasiness to the French metal trades. Thus far, credits placed under the head of reparations in kind have not been particularly large, but from 1928 on, as large a sum as 1,300,000,000 gold marks will be credited yearly to France by the Reparations Commission. As the cash payments by Germany will not exceed 300,000,000 gold marks annually, France will be forced to absorb about 1,000,000,000 gold marks of materials.

The primary object of the Dawes plan was to permit the purchase from Germany of such commodities as were needed for consumption in France, but not produced domestically in sufficient quantities, such as coal, nitrogen, fertilizers, dyes, sugar, lumber, produce, etc. So long as French production of these products is smaller than the consumption there is no objection to receiving them on reparations account. However, to absorb this vast annual credit under the Dawes plan, it has become necessary to lay down a large program of public works for the utilization of this material. This was the object of the act of March 24, 1928.

Under the program established by this act are the purchase of naval and other maritime craft, modernization of ports, purchase of railroad rolling stock and shop equipment, establishment of large coking projects in the east of France, supply of telephone cable between Paris and Bordeaux, supply of materials for the construction of low-rent dwellings and equipment for the French colonies.

To satisfy French producers that this influx of reparations material

from Germany would not seriously injure their business, the Government promised that only 20 per cent of the projected work would be done with reparations in kind. But it is pointed out by French manufacturers that if wages, transportation costs, etc., are deducted from the total cost of these projects, the 20 per cent, particularly in the case of port improvements, represents almost exactly the value of materials to be used. In addition, it is argued that for many years after termination of such work, it will be necessary to obtain repair parts from Germany.

Domestic demand is continuing to increase and there is a noticeable lengthening of deliveries on most products and concessions, in evidence early in July, have been almost eliminated. No advance in prices is expected, however, unless higher wages to coal miners in the Nord and the Saar mines causes increases in production costs.

Some works are considering increase in their capacity for production of open-hearth steel. Among these are the Acieries de Chatillon-Commeny, which is installing large furnaces. The Société Anonyme des Hauts Fourneaux, Forges et Acieries de Pompey is preparing to make nickel and chrome-nickel steel.

Machine tool builders report considerable activity and it is noteworthy that Andre Citroën, automobile manufacturer, is installing equipment for the production of a six-cylinder car about September. The total cost of this change will be about 40,000,000 fr. The company will continue to make a four-cylinder car.

Foreign Steel Too High to Compete

Importers in United States Sell Only Small Lots—Report That European and American Mills Will Meet

NEW YORK, Aug. 14.—With Continental steel prices continuing to advance, importers in New York are in most cases unable to do business in more than small lots. Following a recent increase in prices plain steel bars of Thomas grade are quoted at 1.29c. per lb., base, f.o.b. Antwerp, or about 1.85c. per lb., duty paid, New York. Beams are quoted at 1.70c. to 1.73c. per lb., New York, and channels at 1.73c. to 1.75., delivered New York. On the present scale of prices, open-hearth reinforcing bars are quotable at about 2c. per lb., duty paid, New York, or 2.10c. to 2.15c. per lb., delivered to consumers' plant in the metropolitan area.

As a result, the saving to consumers here is of so little consequence as to make it almost impossible for importers to sell concrete bars at these prices. In fact, the cost of the imported product is in excess of the price quoted locally in many cases on bars rolled from old rails and with a local New Jersey producer of iron bars reported preparing to roll concrete bars from old rails, importers

do not seem to expect much future reinforcing bar business.

Importers report a moderate volume of business in small tonnages of various products and in a few instances are able to offer steel delivered at slightly less than the present European quotation, having been in a position to buy distress tonnages that came onto the market during the recent Antwerp dock workers' strike. Importers show considerable interest in future development of the Steel Export Association recently formed here to include the leading interest and many of the large independent mills.

A cabled report was received about a week ago by an importer stating that it was reported in European steel circles that a meeting of European producers and the new Steel Export Association was scheduled for September and October in New York. This report is doubted here, but importers are interested, as they point out that at such a convention the question of limitation of European exports of steel to the United States might come under consideration.

trial managements is involved in the comparison between the two cities. Worcester's rate would doubtless be approximately that of Springfield were it not for the effects of years of competitive striving. The Springfield Safety Council has made an aggressive campaign. Plants are divided into four groups according to the number of employees. Each month the winner in each group is given the custody of a banner indicating leadership. Employers are becoming more and more interested, which means the application of authority to an insistence that every one in the plant organization—superintendent, foremen and the rank and file—turn his mind to safety.

German Yard Builds Ships of Copper Bearing Plates

HAMBURG, GERMANY, July 28.—Following numerous tests, which are reported to have had satisfactory results both to the shipping companies and the steel mills, copperoid steel plates, which contain 0.28 per cent copper, are to be used in the construction of two vessels at the Deschimag A. G. at Bremen. Tests made are understood to have shown that the higher cost of these copper bearing plates was offset by their extended wearing qualities through resistance to corrosion. Reduction of costs of painting and replacement of rusted plates are considered sufficient advantage and the same tensile strength as in ordinary ship plates was obtained. If the two vessels to be constructed prove satisfactory, it is planned to produce these plates on a larger scale for shipbuilding.

Safety Contests Reduce Accidents

Springfield and Worcester Figures Show the Latter City Gained From Competition

EARLY returns from the lost-time accident contests which have been started within a year by the local safety councils of a group of important manufacturing cities are interesting because comparisons can now be made with results in the similar contest which has been carried on in Worcester, Mass., without intermission for more than ten years! Until recently Worcester was the only city conducting such a contest. There the interest of participating firms has never lagged, for they saw accident hazard constantly diminishing. But it could only be guessed what part of the decrease came from the stimulus of competition and what part was due to the normal improvement in safety measures which would have reduced the hazard regardless of any contest.

The cities of Springfield, Mass., and Worcester have a number of resemblances industrially. Both have widely diversified manufactures. In both most of the large and many of the small plants are participating in the contest. Probably the natural industrial hazard runs no higher in the one city than in the other. But Springfield has been conducting its contest only since the beginning of 1928.

In the first half of this year 61 Springfield plants employed an average of 22,698 persons, who worked

27,591,207 man hours. In the same six months 42 Worcester plants employed an average of 23,133 persons, who worked 29,176,000 man hours. The method of reckoning results was the same in the two contests, being that established by the National Safety Council, in which the three factors are the number of man hours, the number of accidents and the number of days lost from employment because of them. From these are obtained two measures of comparison: One the frequency rate which is the number of accidents per million man hours, the other the severity rate, which is the average number of days lost per thousand man hours.

In Springfield in the initial six months of its contest the frequency rate was 19.36. In Worcester it was 7.6. In Springfield the severity rate was 1.16. In Worcester it was 0.42. In other words, the number of accidents was two and one-half times as great in the one city and their average severity nearly three times as great. An allowance should be made in favor of Springfield, in that its plants include more very small establishments whose accident rate has been found to be considerably higher than the average of the larger plants, because managements are more neglectful in applying safety measures.

No criticism of Springfield's indus-

European Freight Rates to Canada Reduced

HAMBURG, GERMANY, July 28.—Apparently in an effort to increase the tonnage of steel moving from Europe to Canada, shipping lines operating to Canadian ports have reduced rates on iron and steel from the Continent. The rate on pipe and steel tubes is now 27c. per 100 lb., a reduction of 12 per cent, and a corresponding downward revision has been made on other steel products.

The Detroit River was spanned Aug. 8 by a steel cable which was raised from the river and attached to the two concrete towers which will support the \$20,000,000 Ambassador Bridge. The main span of the bridge will be 1850 ft. in length.

The Columbia Steel Corporation has purchased from the Burke Iron Co. ore deposits near Iron Mountain, Utah, adding 15,000,000 tons to its holdings, which now aggregate 25,000,000 tons.

This Issue in Brief

Manufacture and distribution of steel products would be further localized by adoption of mileage rates on steel shipments, the trade believes. Producers and consumers, as well as railroads, will argue for and against the proposed scale at Commerce Commission's hearing.—Page 408.

* * *

Electric heat-treating furnaces in Dodge plant have hearth floors made of three alloy plates locked at one end, and an alloy steel wall 10 in. high. The floor is supported by fire brick standing between the heating elements. Heat is transmitted through the floor without much loss.—Page 389.

* * *

Wire-drawing dies of tungsten-cobalt last longer and cost less than diamond dies, according to German claims. Alloy dies are not so likely to crack in service; they produce a smoother wire, and drawing speed can be considerably increased, it is said.—Page 394.

* * *

For high production of pig iron, keep the fusion zone low. Continued use of cold air raises the fusion zone. If the hearth is too hot, the logical procedure is to cool it by getting a larger tonnage, not by decreasing the output.—Page 394.

* * *

Industrial research uncovers new markets for New England manufacturers and increases profits by revealing how waste can be utilized. In one case a by-product grew so popular that it has outstripped what was formerly a manufacturer's principal product. In other cases sidelines are materially increasing sales volume.—Page 397.

* * *

Tight money is restricting building activity, says Doctor Haney. Construction is headed downward and will likely continue to decline, economist believes.—Page 406.

Sharpness of cutlery can be measured by new device. Under a definite load, the blade is pressed against a pile of paper strips. "Sharpness" is measured by the number of strips cut, and "durability" by the number of cuts required to reduce sharpness by 50 per cent of original value.—Page 398.

* * *

Earnings of steel producers decline still further. Average earnings of 16 leading producers for first half of 1928, in relation to stockholders' value, was 3 per cent, the poorest showing for that period in the past three years.—Page 413.

* * *

Foreign steel imports at low ebb on Atlantic seaboard, owing to narrow margin between foreign and American steel prices. Difference leaves little or no profit for importer, after paying freight and handling charges.—Page 416.

* * *

Safety contest reduces accident rate. Worcester and Springfield, Mass., competed during first half of year. Springfield's frequency rate was 19.36, while Worcester's was only 7.6. The latter city's excellent showing is ascribed to the contest, which has been conducted for the past ten years.—Page 416.

* * *

Attempts to elevate prices by combinations are doomed to early failure. Excess producing capacity gives birth to the cartel, says editorial writer. Artificial manipulations at once invite outside competition.—Page 418.

* * *

Able industrial management is attracting more and more attention from investors. Security buyers are studying companies with increasing care, realizing that the well-managed concern is the one that may be expected to yield greater dividends.—Page 418.

Water for cooling not required in new blast furnace turbo-blower. The only cooling water needed is that for oil coolers. The turbine can not be started before oil pressure is available to the bearings. If oil pressure fails, the turbine automatically stops.—Page 397.

* * *

Pig iron prices will reach a little higher level within 30 days, says Doctor Haney, barring some unforeseen development in general business. Economist believes that not enough pig iron is being produced, considering the recent rate of steel output.—Page 406.

* * *

Object to reparation payments in shape of materials and equipment. French manufacturers declare their business will be injured by acceptance of naval craft, rolling stock, shop equipment, telephone cable, etc., as part payment of war bill, and that German manufacturers will obtain replacement and repair business.—Page 415.

* * *

Heat-treating furnaces charged quickly and with small loss of heat by use of unique charging mechanism. Furnace doors are raised and charger pushes out the heat-treated forgings and pushes in the tray of cold forgings. The bottom of the tray is withdrawn, depositing the forgings in correct position on the furnace hearth. The entire operation takes only 30 sec.—Page 391.

* * *

Aggregate annual corporate profits vary only slightly in past three years. Total has been close to seven billion dollars for three consecutive years. But in the case of manufacturing corporations alone profits for 1927 were about 8 per cent below those of previous two years.—Page 411.

THE IRON AGE

W. W. MACON
Managing Editor

ESTABLISHED 1855

Stock Market Appraisals

STOCK brokers last month charged their customers 7 per cent interest on debit balances. During the month investment bonds sold at prices that afforded a yield of about 5 per cent; preferred stocks about the same; while the common stocks of some of our superior industrial companies sold for a yield of less than 5 per cent and this was after the drastic decline in May and June, from which there has been only partial recovery. This summary looks contrary to preconceived ideas, and to a greater or less extent it is so in fact. Theoretically the prices for securities ought to adjust themselves to the money rate.

Why, then, do they fail to do so? The answer is two-fold. In the first place there is a prevailing sentiment that the high money rate at present existing is only ephemeral. Bankers and corporations enjoying a surplus may take advantage of it, but the rank and file of investors have to exercise their wits to find good bonds or preferred stocks yielding any more than 5 per cent. In the common stocks investors have been willing to buy on a yield of less than 5 per cent in the expectation that growth in business will relatively soon, in one way or another, produce an actual yield of a good deal more.

Thus, American Telephone and Telegraph, a premier security, which pays a \$9 dividend, with official intimations that the rate will not be raised, recently sold in excess of 200 and is now in the neighborhood of 175, making the return around 5 per cent. But the stockholders recently enjoyed valuable privileges, which are recurring and give them an actual return in excess of the nominal. So it is with other standard corporations.

This reflects two important things in the investing state of mind. The first is the confidence that is felt in our economic outlook, and the second is the belief that so long as our national economy is soundly conducted our natural increase in population together with our improvement in efficiency will swell the business, profits and dividends of our enterprises, providing that the enterprises are well managed.

The last qualification recognizes the importance of management in the present investor estimation. The concern that avoids labor difficulties, that engages in scientific research work, that develops new resources, etc., is the one that may be expected to yield increased dividends. The concern that shuns those policies is the one that is likely to cease paying anything at all. In regard to this industrial psychology investors are more and more discriminating.

An expert speculative public is ever trying to anticipate such developments and in its operations makes

use of banking credit. The tightening of credits curtails the activities of such persons, without affecting the economic denouement at all. If the outlook for a certain security indicates an appreciation of 10 per cent in the course of a year, it will reach that on the buying of investors who use their own funds, instead of the advance being effected in a few days on the buying of sharp speculators using borrowed money; and that is substantially the whole difference in events as between now and six months ago. The market will be less active, for there will be less churning.

In short, our stock market has become to a degree an intelligent and discriminating affair. We shall not venture to say that it is more so than ever before. However, it is distinctly not a market wherein gamblers may safely buy anything whatsoever, on the advice that the market is rising as a whole. On the contrary, we have now a situation wherein good things may be expected gradually to improve in value while bad things are likely to shrink.

Cartels Not a Cure

EUROPEAN industrial thought runs to cartels and conventions, whereof many have been formed in recent years. The idea is not new, such arrangements having been in existence in times long past. American thought does not now run that way for the simple reason that our laws forbid. The formation of associations for export trade is as far as our producers may go. European producers are unable to understand the difference and cynically remark that our laws permit concert of action for interference with their markets while preventing us from entering into any international agreements with them. This is, of course, a misunderstanding.

The cartel or convention is usually an exhibition of producers' despair, and for the long run nothing to occasion worry in the minds of consumers. It results from the development of excessive capacity for production and violent competition to make use of maximum capacity, with the consequent trimming of prices. The inspiration of the cartel is therefore fear and its purpose is to prevent prices from going lower rather than to raise them.

It has been the general experience of the world that attempts to elevate prices for the benefit of producers are doomed to early failure. Thus, the Secrétan corner in copper, the later adventure of the Amalgamated Copper Co., the Brazilian coffee valorization, and most recently the British rubber restriction. Almost all artificial manipulations in that direction at once invite outside competition. The only safety is in the

possession of natural monopolies, or with conditions so concentrated that agreements may be arranged and be kept among a few persons. Of this last the production of diamonds is a good example. There are not many commodities in respect to which conditions can be worked out so fortunately for the producers.

A general survey of production reveals bounteous natural resources, at least as far ahead as we do our figuring, and an excessive capacity for their beneficitation. Consequently the consumer enjoys low prices. In the end more or less capital is extinguished, as is happening now in the textile industry of New England. Meanwhile capital efficiently employed receives but a low return. An IRON AGE compilation shows that 16 of the largest steel companies of the country, including the Steel Corporation, earned 3 per cent for their stockholders in the first half of 1928, against 3.2 per cent in the first half of 1927. Mr. Schwab has estimated only 5 per cent per annum for the American iron and steel industry as a whole. Enmeshed in the operation of economic laws, the octopuses and giants are rather feeble. In the contest between capital and non-capital the former tends to get the worst of it.

Whence the Steel-Making Scrap?

TOTAL production of pig iron and ferroalloys in the first half of this year was 18,686,412 tons. The official statistics, just issued, are given elsewhere in this issue. Total production of steel ingots and castings may be estimated, rather closely, at about 25,400,000 tons. This would make the pig iron about 73½ per cent of the steel. Prior to 1911 production of pig iron exceeded that of steel ingots and castings, but in the past 17 years steel has been running ahead more and more.

There has always been a large excess of production of steel ingots and castings over the pig iron so used. That was true even in the Bessemer days, when scrap was thrown in to temper the heat caused by silicon running high. As far back as May 22, 1902, reference was made in an IRON AGE editorial to the rule made by large steel companies that scrap was no longer to be used in the converter but was to be saved for the open-hearth. So much pig iron was used in making iron castings that there was an excess of total pig iron over steel ingots and castings. Iron castings grew but little while steel grew greatly, and that helps to account for the swing so often mentioned, of "steel" exceeding pig iron. The works scrap has been chiefly responsible.

In the early days of basic open-hearth steel making there were large supplies of works scrap, because there was both Bessemer and open-hearth scrap. As open-hearth increased and Bessemer decreased the proportion of works scrap to basic steel decreased. Then came a turn in the other direction, and it is the extent of that turn which it is interesting to study at the present time.

A close measure can be had by dividing production of basic open-hearth steel ingots and castings into production of basic pig iron. As pig iron stocks used to vary materially it is safer to take pairs of years. In 1912-13 pig iron figured at 57.4 per cent. In 1926-27 it had decreased to 53.2 per cent. For the first half of this year basic pig was 10,715,988 tons and basic open-hearth ingots and castings may be put at 21,400,000

tons, which would make 50 per cent. The proportion of scrap has continued to increase.

There is ground in the statistics for the view that progress in the production of sound ingots has been entirely eaten up by demand for better steel, so that there is as much cropping, as large a percentage of works scrap, as a few years ago. The extra supply of scrap comes from outside, perhaps more industrial scrap, certainly more old material. And this latter is likely to increase for some years, for in the days when this old material was new the production of steel was increasing rapidly. Perhaps in time steel will be made to last longer, whereupon there would be another twist in the curve, but for a number of years the supply of old material will continue to grow.

British and American Outputs

SUPERIORITY of machine equipment in American manufacturing industries and much greater power behind the efforts of the average worker are emphasized in a report of the National Industrial Conference Board which compares British and American production results. Eight selected major industries in the United States used an average of one and one-half times as much horse power per wage earner as do the same industries in Great Britain. Production per worker shows a still more impressive difference, that in the United States being two and one-half to three times as much.

In this difference between the two countries in power consumed, on the one hand, and in production on the other, lies the very significant element of greater efficiency in the application of power. One horse power in the modern American steel mill or machine tool is of course a far greater producer than one horse power applied in machinery of older type, manufacturing the same product.

The difference in the two ratios is most marked in the steel industry. To quote the Conference Board report:

Steel works and rolling mills in Great Britain in 1924 employing 200,181 wage earners turned out \$660,895,000 of product, the net output or value added by manufacture representing \$195,125,000 of the total. In the United States, in 1925, \$2,946,068,000 worth of product was turned out with the relatively small working force of only 370,726, the net output or value added by manufacture amounting to \$1,134,107,000. In the British industry 9.15 horse power, in the American mills 12.85 horse power, was back of every worker. As a result, production in terms of value added by manufacture in the American steel industry was \$3,059 per wage earner employed, as against only \$975 per worker in the British mills, or more than three times as much.

In other words, with 33 1-3 per cent greater power back of the American worker more than three times the British output was secured, reckoning in dollars. These figures concerning the steel industry will astonish no one familiar with it. American mills have made extraordinary strides in productive efficiency, partly through better systems, but more particularly through better equipment. It may fairly be said that the main factor is the automatic character of so much of the

machinery, reducing to a minimum the number of men employed.

The Conference Board's survey shows similar ratios to exist in the automotive and electrical industries. There, too, it is undoubtedly a matter of investment in the most modern equipment, of never-ending improvements in American machine tools and their prompt utilization by our manufacturers in the constant effort to reduce costs by lowering the items of overhead and labor.

Tin Prices and Consumption

LAST June pig tin in New York dropped to 45.75 cents a pound, its lowest price in almost four years, or since September, 1924, and the market has since had only a slight recovery. As the average price in the last two calendar years was 65 cents, there is now a relatively low market, only a trifle above the average in the three years before the war. The 15-cent tin of 1898 is of course only of historical interest. Whither tin is trending in the next few years is a problem of great moment.

Marketwise tin is by far the most mysterious of the familiar metals. It is notable that those most fully posted frankly state that virtually they know almost nothing. It is impossible to measure closely the influence of price upon production but the influence upon consumption is a more open matter.

Consumption of tin in the United States is roughly about 35 per cent for making tin and terne plate, 25 per cent or less for making solder and up to about 15 per cent for bearing metal, of which the automobile industry is a very large consumer, this allocation leaving 25 per cent for miscellaneous. It is significant therefore that comparing the average of 1912-13 with the average of 1926-27, deliveries of tin in the United States as reported by the New York Metal Exchange increased only 61 per cent, while the production of tin plate increased 93 per cent and automobile production increased 835 per cent, or by about 3,600,000 cars and trucks per annum.

During this period the tin plate makers greatly reduced the amount of tin consumed per box of tin plate. At the same time they improved the quality, which is largely a matter of uniformity in distribution of the coating, accomplished by more accurate rolling of black plate and by improved tinning methods, while the "list edge," formerly involving a large loss, has been almost eliminated. Solder is conserved by methods of can making that take less of it, by there being more mechanical soldering, and by the tin proportion being decreased. Collapsible tubes are now made of lead except where health requirements intervene. With aluminum at 25 cents a pound, aluminum foil is displacing tin foil. The proportion of tin in babbitt metal has decreased.

These changes represent accomplishments and there is no reason for assuming that cheap tin would result in a reversion to older practices. There might, however, be expansion of tin consumption in new uses. So much has been done that little room seems to be left for further economies, and the industries using tin promise continued expansion. In the last 15 years United States consumption has increased considerably more than that of the rest of the world and thus there are chances of consumptive demands elsewhere having a large increase.

Propaganda of long ago that tin production could not be greatly increased is exploded, for it has increased and there has been much progress in the technique. The working of alluvial deposits has been extended to leaner gravels, for with the improved dredging equipment and the use of gravel pumps, facilitated by operations passing into strong hands with command of capital, a half pound of tin per cubic yard is workable against one and a half pounds formerly.

Both supplies and consumption of tin have increased this year. World supplies in the first half of the year were reported at 62,249 gross tons, or 4034 tons increase over the first half of last year. Deliveries are reported at 61,751 tons, or 2848 tons increase. The visible supply increased 498 tons, against a decrease of 688 tons in the first half of last year. In the Federated Malay States production has increased, and last year, stimulated by the high prices of 1926 and 1927, it was 52,176 tons or 13.5 per cent more than in 1926. This year it has been running 20 per cent higher than in 1927, but with the lower prices of recent months the higher cost workings may do less.

NEARLY half a billion dollars is added by the recent General Motors contract for group life, sickness and accident insurance to the \$6,379,000,000 of policies of this class in force at the close of 1927 for the benefit of industrial workers in the United States. Group insurance is least in cost, because negotiated and paid for in single transactions covering hundreds or thousands of individuals. It calls for no medical examinations and is independent of ages, because the employee group represents a fair average of human health, condition and hazard, and, surprisingly, its average age does not change. If an old-age endowment is included, with coverage for accidents outside of working hours, the workers' "total situation," as the insurance man calls it, is thoroughly protected. Helping the workers to help themselves is well understood to be a useful practice in promoting the welfare of industrial corporations. Group insurance protects the worker's family against loss of his earning power in case of accident or death, and with old-age provision included may even be said to protect him against the consequences of living too long.

HAVING failed to organize the automobile industry as well as various other metal-working lines, the American Federation of Labor is now to undertake the unionization of airplane manufacturing plants. The officers of the Federation cannot be unaware of the fact that the airplane plants, especially those building engines, have attracted to their payrolls the most expert of mechanics. In fact, there has been complaint recently from automobile companies that some of their best men were leaving for the better paid work of airplane engine building. Militant unionism has found that the more highly skilled the employment the greater the resistance to organizing effort. In the metal trades the best paid workers have not been attracted by the leveling aims of the unions and the supply of high-grade craftsmen seldom has been equal to the demand. Hence the outlook for the unionization of airplane mechanics cannot be called promising.

CORRESPONDENCE

Copper Content of Iron Ore

To the Editor:—I am attempting to get some information about the copper content of American iron ores. A fairly close examination of THE IRON AGE for the last 10 years fails to reveal any information on this subject. A number of articles were printed on the iron resources, giving the ordinary analyses in iron, sulphur and phosphorus, but none of them contained a figure showing that the ore had been analyzed for copper.

In the special volume of the British Iron and Steel Institute, covering its American visit in 1890, several analyses of iron ores are given, but even in this volume the only anal-

yses which quote copper are those of ore from the Cornwall banks in Pennsylvania. These ores have only a trace of phosphorus, but are high in both sulphur and copper. Three analyses for copper are listed at 0.75, 0.56 and 0.30.

So far as I can learn, most iron ores are free from copper. This is particularly true of the Birmingham district and the Lake Superior district. In Tennessee, there are a number of beds that are high in copper or other metals, but as they are worked for the copper content rather than for the iron, they can hardly be classed as iron ores.

The Bureau of Mines states that it has no record of the copper content of iron ores, although it is known that some ores, such as at Cornwall, Pa., and at Fierro, N. M., contain small quantities of copper.

If any of your readers have further data on the subject, a communication would be appreciated.

What Water Transportation Is Beginning to Mean

Developments Which Emphasize the Increasing Competition Which Chicago Mills Face Through Steel and Iron Coming from Abroad, from Eastern Plants of the United States, from the Pittsburgh District, Etc.

THE two photographs here reproduced show ships which have traveled from Europe by way of the St. Lawrence River and the Great Lakes to the docks of the East Chicago Dock Terminal Co. The upper one is of the Novadoc, which was loaded in England with low-phosphorus pig iron, and is being unloaded at Chicago. The lower one shows the unloading from a ship of structural shapes and pig iron; to be noted in this connection is the length of the steel beams and the facilities for double car loading.

The pig iron came over at a low rate not regarded as likely again to be duplicated or to become a regular practice, for the reason that the iron cargo was used essentially as ballast and that not many boats are expected

to make trips under similar conditions. The particular boat was built in Europe for service under Canadian direction on the Great Lakes.

What is portentous for Chicago and indicative of a further alinement of distribution territories for other sections of the country through wider use of water transportation are some of the negotiations under way. For example, the feasibility is under consideration of carrying cast iron pipe from New Jersey by ship to the Chicago district by exporting it by boat into Canada and then importing it from Canada through the St. Lawrence waterways, with delivery costs into Chicago for about one-half the all-rail freight rate from Birmingham to Chicago, which is \$8.20 a ton.

Similarly a Pittsburgh steel mill is planning to send steel by rail to Cleveland, where it would be put on board ship for transport to Chicago. With a rail charge of \$2.60 a ton, boat freight of \$1 a ton, and handling charges of 40c. and 50c. at Cleveland and Chicago, respectively, and the 50c. switching charge at Chicago, the transportation cost would be \$5, against \$6.80, the all-rail Pittsburgh-Chicago rate.

The special attention being paid to water shipments stresses the issue that a given production district, in this case Chicago, appears less secure from outside competition that the distinctly rail freight charges have helped to make it.

Iron and Steel Markets

Steel Demand Holds High Summer Level

Oil Pipe Business Mounting—Price Advances Announced on
Sheets and Shafting—Large Pig Iron Purchases
at Cleveland and New York

MID-AUGUST finds business holding up to the surprising volume of the past several weeks, without, however, signs of increases in the immediate future. The one exception is that the steel requirements for pipe for the oil industry are mounting rapidly. Otherwise, strictly new buying is on the whole not of impressive proportions. Seasonal expansion for fall needs, as in rails and wire products, cannot be expected before September.

Active specifying against contract purchases, often accompanied by demand for quick delivery because of low stocks, has lifted operations in the general Pittsburgh area to nearer 85 per cent of capacity than 80 per cent, or somewhat above the late July rate. In the Chicago district, specifications compare closely in volume with those of the first week of August, but for the most part they call for the lighter tonnage commodities and ingot output there has not increased.

The price trend is toward higher levels. Cold finished steel bars and shafting, including screw stock, have been advanced \$2 a ton, restoring the base of 2.20c., Pittsburgh or Chicago, and preparing for a higher base for fourth quarter sales, provided hot rolled bars hold the \$2 increase recently announced for the same period. New higher prices also have been named for last quarter sheet sales, and billets and other semi-finished steel are believed to be headed for a rise.

The oil industry has brought a brisk demand for seamless pipe for the new Santa Fe, Cal., oil field, and several pipe lines again are under active negotiation. A 250-mile line has just been closed, and the 480-mile line of 24-in. pipe from the Panhandle to Omaha, under consideration for some months, is an early likelihood, and progress is being made on a 500-mile line to St. Louis. For oil tanks for the Texas & Pacific 3000 tons of plates and 300 tons of large rivets will be required.

Several thousand tons of rails have been bought in the week, representing extra requirements for early delivery. Included were 1000 tons for the Wheeling & Lake Erie, on top of 2500 tons purchased two weeks ago, 1700 tons for the Southern and 2000 tons for the St. Louis & Southwestern.

The Missouri-Kansas-Texas has closed for 500 cars. For miscellaneous needs, the Pennsylvania is inquiring for 25,000 tons of plates, shapes and bars and the Great Northern for 6000 tons.

The prices to be asked for sheets for the fourth quarter are 4c. for autobody, 2.75c. for black, 3.60c. for galvanized and 2c. for blue annealed up to 45 in. in width and 2.10c. for sheets 45 in. and wider, all Pitts-

burgh base, with the usual differentials for Gary and Birmingham. Except for the autobody sheets, which would have the usual spread over black sheets, the new levels represent an advance of \$2 over what has been regarded as the regular market, but compared with the basis of the bulk of current shipments are actually \$3 higher on black and \$4 on the galvanized product.

The considerable volume of sheet buying meanwhile gives color to the belief that no little tonnage already covered will be carried into the last three months of the year.

Although fabricated structural steel bookings, totaling only 25,000 tons, amounted to about half the average of recent weeks, continued activity is indicated by new projects calling for more than 37,000 tons. Subway work in New York accounts for 29,000 tons of this total.

The heavy tonnage of structural steel placed with fabricating shops during July is reflected by the tonnage report for the month of the New York Structural Steel Board of Trade, which indicated bookings of 70,000 tons in the New York metropolitan territory, exclusive of bridges, subways, etc. This compares with 38,000 tons in the previous month and is the highest amount since July, 1927, when 73,000 tons was reported.

Nails show a sharp rise in demand. Mill output having dropped to a 60 per cent rate now gives promise of expanding, particularly with the fall trade in prospect. No price advances are talked of, stabilization having yet to be thoroughly realized, following the Steel Corporation's recent reduction to the mid-point of the wide spread that existed among prices.

Pig iron sales at Cleveland totaled 84,000 tons, one of the largest weekly totals of the year, following bookings of 100,000 tons in the previous fortnight. In New York 16,000 tons was sold in addition to 30,000 tons bought for various plants by a maker of heating equipment. Selling pressure from steel company furnaces is abating with the increased use of pig iron in open-hearth mixtures. Prices have a firmer tone in the Central West, but in the East attractive tonnages are still bringing out concessions. Much of the business done is for the fourth quarter, indicating that many foundries believe the market is scraping bottom and that there is no advantage in postponing buying.

Heavy melting scrap at Pittsburgh has advanced another 50c. a ton, making a recovery of \$1.50 to \$2 above the recent low point. Scarcity of scrap in the face of efforts of dealers to cover short sales indicates that the advance has not yet run its course.

Pittsburgh

Ingot Production Now Ranges from 80 to 85 Per Cent— Heavy Steel Scrap Again Advances 50c. a Ton

PITTSBURGH, Aug. 14.—If steel production is as large in the second half of the month as it has been in the first, August is likely to follow July in setting a record output. Mid-August finds this and nearby districts producing ingots at from 80 to 85 per cent of capacity. The leading manufacturers are producing at that range, while a number of the smaller companies are running virtually at capacity. The general average, therefore, is probably nearer 85 than 80 per cent.

A brisk demand for seamless pipe to take care of the requirements of the newly opened Santa Fe, Cal., oil field is one of the contributory causes for the upswing in steel output.

It seems that, while the larger producers wanted to conserve this field for development when the oil market improved, sinking of successful wells by some smaller operators made it necessary for the former to drill to prevent seepage of oil from below their land holdings. Coupled with the recent large pipe line orders, the steel requirements for pipe are mounting rapidly.

Specifications for sheets, tin plate, strip, bars and shapes all appear to have increased recently and the demand, as indicated by specifications, is at least holding its own in cold-

finished steel bars (screw stock). Rails, track supplies and wire products are slow, but that is a seasonal condition. Strictly new business is not of impressive proportions except in seamless pipe, and in a general way the experience of the Steel Corporation in decreasing order books is common to the industry at large. But fourth quarter buying has not yet begun to manifest itself.

Price tendencies still are toward higher levels. Announcement has been made by one company of advances of \$2 to \$3 a ton in the common finishes of sheets on fourth quarter business.

An advance of \$2 a ton on orders taken for shipment over the remainder of this quarter has been made in cold-finished steel bars and shafting. Strip makers have firmer price ideas as to the future, while in semi-finished steel there is no longer much doubt that an attempt will be made to establish a higher market on shipments in the final quarter of the year. Wire products are firmly held in most centers, and makers of plates, shapes and bars are earnest in their effort to establish prices at more profitable levels.

A scramble by dealers to cover short sales in the steel works grades has sent prices up another 50c. a ton, and the recovery from the recent low point now amounts to \$1.50 to \$2 on heavy melting steel. This advance is about as sharp as any that has taken place in the market in recent years and probably has not yet run its course, as offerings are still light and it is hard to get scrap past outside markets to Pittsburgh, even at current figures. With steel works operations on the increase, there is a danger that some consumers who have scrap on order may not get sufficient supplies to escape fresh purchases.

Pig Iron.—In point of business this market still presents a sharp contrast

with others. While there is a very steady movement on old orders and some furnaces are shipping as much iron as they are producing, the current demand is very light and in all grades runs entirely to single carloads. Prices are unchanged, but reflect a somewhat firmer attitude on the part of producers, some of whom already have named \$17, Valley furnace, as a minimum on fourth quarter foundry iron, or 50c. per ton more than is being done on current business. The steel companies appear to be using a larger proportion of their iron production than recently, and selling pressure from that direction has abated. The advance in scrap, which has brought heavy melting steel, delivered Pittsburgh, to even terms with basic iron at Valley furnaces is also a factor in the firmer prices on pig iron.

Prices per gross ton, f.o.b. Valley furnace:

Basic	\$16.00
Bessemer	17.00
Gray forge	\$16.25 to 16.50
No. 2 foundry	16.50 to 16.75
No. 3 foundry	16.25 to 16.50
Malleable	17.00
Low phos., copper free....	26.50

Freight rate to Pittsburgh or Cleveland district, \$1.76.

Ferroalloys.—Consumers are taking out ferromanganese, ferrosilicon and spiegeleisen very steadily on contracts, but new buying amounts to little. Prices are unchanged.

Semi-Finished Steel.—Continued high operation of sheet and tin mills is reflected in good specifications on contracts for sheet bars. Strip makers are taking out billets and slabs steadily. New business in these various forms is light. Current shipments generally carry a price of \$32, Pittsburgh or Youngstown, but it is becoming clearer that producers intend to ask \$1 a ton more on fourth quarter tonnages and one producer of billets already is naming \$34, Pittsburgh, as the fourth quarter contract price. Wire rods are firm at \$42, base Pittsburgh.

Bars, Plates and Shapes.—Specifications on existing contracts are rolling in freely in bars and shapes, but shipments on old orders are exceeding new business and backlogs are decreasing. On such new business as is developing—it is chiefly made

up of small lots—1.90c. is as low as any makers in this district are doing. Plates are not in such good demand as bars or shapes, and good railroad car tonnages seem essential to provide the mills with an engagement sufficient to make them independent of strip mill competition on prices. Pipe line orders are furnishing some plate mill engagement, and there is also a fair amount of river barge business. It has been a light week in structural awards for local shops.

Rails and Track Supplies.—The Norfolk & Western Railway this week will place 6000 kegs of spikes. The market for that product is easy rather than firm at \$2.80, base, per 100 lb., and there is somewhat less insistence upon the recently announced charge of \$5 a ton for less-than-carload lots. Shipments on old orders are fairly large and are exceeding new business. New rail business does not amount to much in either light or standard sections.

Wire Products.—Activity is lacking in nails and wire products, but there is marked firmness in prices. Dullness, common to this time of the year, is heightened by the large takings of jobbers earlier in the year to escape price advances.

Tubular Goods.—Continued good demand for seamless oil well pipe is noted, particularly from California, where deep drilling has uncovered fresh supplies. The Seminole field also is taking a goodly amount of seamless pipe. Lapwelded oil country goods are only moderately active, but lapwelded pipe capacity is well engaged on line pipe and the prospect is bright for additional business. The Texas Co. and several other producers are jointly interested in a pipe line calling for 218 miles of 16-in. pipe to run from Winkler County, Tex., and Lee County, N. M., to El Paso, Tex. The automotive industry still is a good taker of mechanical tubing.

Sheets.—The Youngstown Sheet & Tube Co. has announced fourth quarter prices, naming 4c. base, on automobile body sheets, 2.75c., base, on black, 3.60c., base, on galvanized and 2c., base, for blue annealed sheets of widths of less than 45 in. and 2.10c., base, for widths 45 in. and

over, these prices all being f.o.b. Pittsburgh. The new prices, which probably will be followed by other producers, represent no change in body sheets, nor on what has been commonly regarded as the market on blue annealed sheets; on black sheets they are \$2 to \$3 a ton above the recent market and on galvanized from \$2 to \$4 a ton higher. This company also announces the adoption, effective Oct. 1, of a cash discount of one-half of 1 per cent on the f.o.b. mill value for payment within 10 days from date of invoice. Several important producers have announced this change in terms, but as yet the American Sheet & Tin Plate Co. has not followed. It is understood that some opposition to it has developed among jobbers. Sheet specifications still are heavy, notably from the motor car builders, and a feature is the promptness with which shipments are wanted in a number of cases. New business is not keeping pace with shipments on old orders, but backlogs are not decreasing enough to warrant any lessening of mill operations, which still are averaging 85 per cent of capacity.

Tin Plate.—More favorable weather conditions have resulted in increased production. Demand for tin plate for perishable food containers continues heavy. The Northwestern salmon pack is exceeding expectations and has produced some supplementary orders to accommodate it. Mill operations still are more than 90 per cent of capacity, with output more in keeping with that rate on account of restored mill crew efficiency due to cooler weather. Changes in the furnaces at the Gary mills of the American Sheet & Tin Plate Co., to accommodate the new system of breaking down the bars on continuous mills, will mean that four mills (two double mills) will be idle at a time while the furnaces serving them are being altered.

Cold-Finished Steel Bars and Shafting.—Leading makers have announced an advance of \$2 a ton, effective immediately and to apply on new business accepted for shipment during the remainder of this quarter. No action yet has been taken on fourth quarter prices, which will be governed

Chromium Nickel Vanadium.....	1.50	4.15
Carbon Vanadium	0.95	3.60

Above prices are for hot-rolled steel bars, forging quality. The ordinary differential for cold-drawn bars is 1c. per lb. higher. For billets 4 x 4 to 10 x 10 in., the price for a gross ton is the net price for bars of the same analysis. For billets under 4 x 4 down to and including 2½ in. squares, the price is \$5 a gross ton above the 4 x 4 billet price.

Slabs with sectional area of 16 in. or over carry the billet price; slabs with sectional area of 12 in. to 16 in. carry a \$5 extra above the billet price and slabs with a sectional area under 12 in. carry the bar price.

Band sizes are 40c. per 100 lb. higher.

Rails

Per Gross Ton

Standard, f.o.b. mill.....	\$43.00
Light (from billets), f.o.b. mill.....	36.00
Light (from rail steel), f.o.b. mill.....	34.00

Plus differentials for lengths over 18 ft. and for commercial exact lengths. Warehouse discounts on small lots are less than the above.	

by the course of the hot-rolled bar market. Current specifications are running well ahead of ordinary experience at this time of the year.

Hot-Rolled Flats.—The past week has developed a fresh increase in specifications for hot-rolled strips and the month's business to date with most makers is running ahead of the same period last month. While prices still show a little irregularity, the trend in the main is in the direction of firmness, with a restoration of the regular schedules of 1.90c., base Pittsburgh, for 6-in. and wider, 2.10c. for 3 to 6-in. and 2.20c. for less than 3-in., the objective of most makers.

Cold-Rolled Strips.—Business, as typified by specifications on contracts, has improved materially. It is admitted that on some especially attractive business a base of 2.65c. per lb., Pittsburgh, for lots of 3 tons or more has been done, but generally 2.75c. is what is wanted on new tonnages for shipment over the remainder of this quarter.

Bolts, Nuts and Rivets.—Specifications are constant enough, but they are mostly for small lots and impose no tax upon productive capacity. Prices remain firm.

Coke and Coal.—The market is still rather bare of spot tonnages of beehive oven furnace coke, and, while demand is small, producers are having no trouble in making sales at \$2.75 per net ton at ovens. Spot foundry coke is plentiful and is selling at the same prices that have ruled for several weeks. The coal market is a shade more active as a result of an increased demand for household requirements. Gas slack has stiffened slightly in price, but quotations otherwise are unchanged, due to the fact that the prospect of somewhat larger demand has caused resump-tions by mines that have been idle. A request issued by local officials of the miners' union for a conference with

former union mine operators for a discussion of a wage scale has received scant attention from the latter.

Old Material.—It develops that two steel makers in the district whose requirements as to quality are exacting have paid \$16 for heavy melting steel, and a dealer short on this grade at another point in the district is reported to have paid even more to secure needed tonnages. The entire list is strong, and few grades have failed to reach higher levels than were current a week ago. Dealers are trying to buy heavy melting steel at \$15 to cover sales, but are not having much success, and the real minimum price is \$15.50. While there has been some mill buying, the upturn in the market essentially is the result of a panic among dealers who sold short and then became nervous over the moderate amount of material that was reaching the market. Offerings still are moderate, and it would seem as if still higher prices would be necessary to increase them. No scrap can reach this market from the West at present prices, because higher net returns are obtainable in Western consuming centers, and shipments from the East are hampered by the same conditions. It is easy to understand the scramble for

railroad lists and the high prices they have brought in the past two months.

Prices per gross ton delivered consumers' yards in Pittsburgh and points taking the Pittsburgh district freight rate:

Basic Open-Hearth Grades:		
Heavy melting steel.....	\$15.00 to	\$16.00
Scrap rails.....	15.00 to	15.50
Compressed sheet steel....	14.75 to	15.25
Bundled sheets, sides and ends.....	13.75 to	14.25
Cast iron carwheels.....	15.00 to	15.50
Sheet bar crops, ordinary....	15.50 to	16.00
Heavy breakable cast.....	12.00 to	12.50
No. 2 railroad wrought....	15.00 to	16.00
Heavy steel axle turnings....	14.00 to	14.50
Machine shop turnings....	10.00 to	10.50
Acid Open-Hearth Grades:		
Railr. knuckles and couplers	16.00 to	16.50
Railr. coil and leaf springs	16.00 to	16.50
Rolled steel wheels.....	16.00 to	16.50

Austin Machinery Corporation in Receivership

The Austin Machinery Corporation, 2969 Lake Shore Drive, Muskegon, Mich., maker of concrete mixers, gasoline locomotives and contractors' equipment, with plants at Toledo, Ohio, Fairmont, W. Va., and Muskegon, has announced the voluntary appointment of a receiver with the contemplated payment of all creditors and continued operation of business.

Westinghouse Building Arc-Welding Laboratory

The Westinghouse Electric & Mfg. Co. has under construction at East Pittsburgh, Pa., an arc welding laboratory, which will be 75 ft. wide, 170 ft. long and 40 ft. high. In keeping with the purpose of the building, the steel frame is to be arc-welded instead of riveted. It will house a 50-ton crane and in addition to the installation of arc-welding equipment, will have massive rolling and forming equipment to be used for forming and shaping the various parts that go into welded machinery. These include motor frames, generator frames, motor rotor rims, and motor end bells.

W. S. Rugg, vice-president of the company, in discussing the possibilities of arc-welding exempts only two classes of structures from the inroads of arc welding. Those structures for which a fabricated steel construction cannot be justified are small pieces built in great quantities, such as the frames and brackets of small diam-

eter motors and structures of such peculiar shape that they are not readily made from such commercial shapes of steel.

The company expects to weld turbine generator frames, locomotive frames, synchronous motor frames and spiders, boxes, machinery bases, floor plates and tanks, miscellaneous machinery parts, industrial heating apparatus, steel pipes, and shop furniture.

At the present time a 26-ton turbine generator frame entirely welded is being fabricated on the shop floors at East Pittsburgh. This generator, one of the largest in the country, will be installed in a New York station of the United Light & Power Co.

Ohio Employment Index Declined in July

In the iron and steel industries of Ohio the July employment index was 95, or 2 per cent less than in June, states the current bulletin of the Bureau of Business Research of Ohio State University. However, the index was 2 per cent higher than in July, 1927. Of the 169 reporting companies, 84 showed decreases in the number of wage earners, 76 increases, and 9 no change. In the machine tool group the standing in July was 4 per cent ahead of the June index of 101 and 25 per cent ahead of July, 1927. Of the 36 reporting concerns making special purpose machinery and appliances, 21 revealed a loss, 10 a gain, and five no change. The index for this group in July was 89, or 2 per cent less than in June.

Chicago

Mill Operations Sustained But Ingot Output Tapers— Sheet Prices Advanced

CHICAGO, Aug. 14.—The number of steel mill units in operation remains unchanged, but, due to the character of incoming business, output measured in tons of ingots is a shade lower than last week. Specifications, which in total volume compare favorably with the first week in August, for the most part are releases against lighter-tonnage commodities, so that one mill with all departments operating can attain only 75 per cent of its practical ingot rating. Opinion varies as to the outlook for shipments during the remainder of this month.

In the last seven days rail mill production has been speeded up a trifle, but fresh inquiry in sight does not appear to warrant a continuation of the present rate of output. The Texas-New Mexico Railway has petitioned for permission to lay 58 miles of new track near Kermit, Tex.

Deliveries against recent structural awards are growing smaller, and from present indications mills cannot hope to benefit materially from new railroad car business for 45 to 60 days.

Prices for finished steel are taking a firmer stand. The leading independent producer in this district has announced an advance of \$2 a ton on black and galvanized sheets for delivery in the fourth quarter. Chicago quotations remain 2.15c. per lb. on blue annealed sheets, and no recognition is being given to strip mill widths. Sheet producers are falling in line in adopting the one-half of 1 per cent discount for cash, and wire manufacturers are considering making the same move.

Except for plates to be delivered in the Southwest there is less deviation than recently from 2c. per lb., Chicago, on bars, plates and shapes.

Pig Iron.—Buying, which is still active, has changed in character in that it is more evenly distributed over the entire district. A Chicago user has closed for 1000 tons of foundry iron and a nearby melter has taken 500 tons. To the west several sizable orders have been placed. Furnace stocks are pared closer, though some aid has been given to merchant iron sellers by the blowing in during July of a steel mill stack at Indiana Harbor. Stocks in the hands of producers are less well balanced than a month ago. It is reported that Ford will revert to the use of malleable castings, for which he had substituted forgings. A sale of silvery in this district has brought out a price below the commonly quoted market.

Prices per gross ton at Chicago:

N'th'n No. 2 fdy., sil.	1.75 to 2.25..	\$17.50
N'th'n No. 1 fdy., sil.	2.25 to 2.75..	18.00
Malleable, not over 2.25 sil.....		17.50
High phosphorus		17.50
Lake Super. charcoal, sil.	1.50.....	27.04
So'th'n No. 2 fdy. (all rail).....		21.51
So'th'n No. 2 (barge and rail).....		21.01
Low phos., sil. 1 to 2, copper free		\$28.50 to 29.00
Silvery, sil. 8 per cent.....		29.79
Bess. ferrosilicon, 14-15%		46.79

Prices are delivered consumers' yards except on Northern foundry, high phosphorus and malleable, which are f.o.b. local furnace, not including an average switching charge of 61c. per gross ton.

Ferroalloys.—This market is quiet, affording little opportunity to test prices except in carlot sales. Contracts recently received obligate prac-

tically all large users of ferromanganese for the remainder of the year.

Prices delivered Chicago: 80 per cent ferromanganese, \$112.56; 50 per cent ferrosilicon, \$83.50 to \$87.50; spiegel-eisen, 19 to 21 per cent, \$40.76.

Structural Material.—Fabricators in this district are well engaged, several of the larger shops having backlogs of seven to eight weeks. Both awards and fresh inquiries are light, but the future is promising. The list of pending projects is impressive, and financial arrangements on promotional schemes are making progress. For the most part architects are busy. One office alone is preparing plans for five structures that will average 3000 tons each. Mill deliveries on plain material range from two to five weeks. Prices are moderately firm at 2c., Chicago.

Mill prices on plain material, per lb.: 2c., base, Chicago.

Plates.—In a week that is quiet from the viewpoint of sales, local mills are concentrating on meeting the exacting delivery requirements of pipe makers, who recently have ordered over 40,000 tons of plates, and fabricators, who are hurrying through their shops the first shipments on projects that now have reached the state of steel erection. Tank steel ordered this week totals 1000 tons, and it is reported that 3000 tons of plates needed for water pipe in Oklahoma City, Okla., has been placed by a local contractor with an Eastern producer. The Texas & Pacific, which was reported to have been in need of 12,000 tons of plates, now is preparing plans for either six 150,000-bbl. tanks or 12 80,000-bbl. tanks, which will require about 3000 tons of steel. The Chicago, Burlington & Quincy will require over 500 tons of steel for the 33 suburban coaches that it intends to build in its own shops.

Mill prices on plates, per lb.: 2c., base, Chicago.

Bars.—Individual orders for soft steel bars are small but numerous and from practically every class of user. A seasonal letdown in demand from manufacturers of agricultural machinery is not apparent, and readjustments in the automobile trade do not appear to have diminished demand for steel from that source. Specifications from forgers are liberal. Prices for soft steel bars are stiffening, 2c., Chicago, being the ruling quotation. The

rate of shipments of alloy steel bars is undiminished, and output in this territory is steady. Prices are firm and alloy differentials are holding. Iron bar mills are operating on a hand-to-mouth basis and far below capacity. Current orders are being taken at 2c., Chicago. Improvement is noted in users' needs for rail steel bars. Both new business and specifications are coming from a wider range of buyers. Sales and shipments during the first two weeks in August were ahead of the corresponding period a year ago. Fall fence post business is slowly getting under way, but it will be three or four weeks before it reaches its full stride. The bulk of going tonnage is being taken at 1.85c., Chicago Heights, but small orders at 1.90c. are more numerous.

Mill prices per lb.: Soft steel bars, 2c., base, Chicago; common bar iron, 2c., base, Chicago; rail steel bars, 1.85c., base, Chicago Heights mill.

Sheets.—Chicago producers are announcing, effective for the fourth quarter, advances of \$2 a ton on black and galvanized sheets. The new prices will be 2.90c., delivered Chicago, for black sheets, and 3.75c. for galvanized. Blue annealed sheets will remain unchanged at 2.15c., Chicago, and no differentials will be recognized in strip mill widths. There has been wider adoption of a cash discount of one-half of 1 per cent, effective Oct. 1, in place of the present 2 per cent. The volume of new business is such that it is believed by some that a considerable tonnage purchased at third quarter prices will be carried over into the last three months of the year. One noticeable effect of the announcement of higher prices for next quarter is the stiffening of prevailing quotations. Specifications are more liberal, and hot mill schedules are better arranged, though hot weather is preventing output from climbing.

Base prices per lb., deliv'd from mill in Chicago: No. 24 black sheets, 2.80c. to 2.90c.; No. 24 galv., 3.65c. to 3.75c.; No. 10 blue ann'd, 2.15c. Deliv'd prices at other Western points are equal to the freight from Gary plus the mill prices, which are 5c. per 100 lb. lower than Chgo. deliv'd prices.

Reinforcing Bars.—A flurry of lower prices occurred during the early part of last week. Several low quotations made their appearance and at least one or two were promptly met. Prices are stiffening again and appear to have returned to levels that prevailed before the dip. It is reported that bids on the general contract for five junior high schools at Chicago have been rejected and the jobs will be readvertised. A similar move is said to be holding in check the General Electric Co.'s building project in Chicago. French inquiry is dragging, but architects are busy and dealers in reinforcing bars are looking forward to a substantial volume of business in the late summer and early fall months.

Rails and Track Supplies.—A Western railroad has closed for 3000 tons of standard-section rails for early delivery. Orders in recent weeks have forced producers to speed up output

a trifle. Miscellaneous business in track fastenings aggregates 2500 tons, and a Southern railroad has bought 500 tons of iron tie plates. Fresh inquiry for rails totals 3000 tons.

Prices f.o.b. mill, per gross ton: Standard-section open-hearth and Bess. rails, \$43; light rails, rolled from billets, \$36. *Per lb.:* Standard railroad spikes, 2.80c.; track bolts with square nuts, 3.80c.; steel tie plates, 2.15c.; angle bars, 2.75c.

Cold-Rolled Strip.—Demand is sustaining an output at 80 per cent of capacity. Prices for 1 up to 3-ton lots are steady at 3.30c., base, per lb., delivered at Chicago.

Wire Products.—Noteworthy in this market is a sharp increase in demand for wire nails. Purchases have been the heaviest in months and shipments are measurably larger. Jobbers in rural districts are finding wire business dull, though in some sections of the country demand for nails has created renewed interest. Railroad orders for wire products are normal for this time of the year. Although there has been some readjustment here and there in the manufacturing trade, the net volume of business being entered at the mills is little changed from the last month or two. Reports from east of the Mississippi River show that stocks in the hands of users are in some cases normal, but in most instances small, ranging from seven to 10 days' supply. Mill operations, after dropping to 60 per cent of capacity, now give promise of expanding, as producers anticipate an active fall trade, which is expected to get under way early in September. Mill stocks are of fair size and well rounded.

Old Material.—Although in size and number sales in this market are not impressive, nevertheless the firmness in prices developed recently has held and on some grades quotations have advanced. A purchaser has paid \$15.15 a gross ton, delivered, for 2000 tons of re-rolling rails, and a round tonnage of shoveling steel brought \$13.37 delivered. Special grades of heavy melting steel have brought as high as \$13 to \$13.25 for the No. 1 grade. Higher prices being paid by brokers have stimulated the movement of yard scrap. This situation is

affording opportunity for making a closer comparison between production and demand. Some sellers foresee a shortage in several grades. Railroad shipments are heavy and prompt. Lists offered this week include 3500 tons by the Rock Island, 2000 tons by the Grand Trunk and 1000 tons by the Chicago & Alton.

Prices deliv'd Chicago district consumers:
Per Gross Ton

Basic Open-Hearth Grades:	
Heavy melting steel.....	\$12.75 to \$13.25
Shoveling steel.....	12.75 to 13.25

No. 1 agricultural cast....	12.50 to 13.00
Stove plate.....	10.75 to 11.25
Grate bars.....	11.50 to 12.00
Brake shoes.....	10.00 to 10.50

*Relaying rails, including angle bars to match, are quoted f.o.b. dealers' yards.

Cast Iron Pipe.—Chicago will take bids Aug. 20 on 1920 tons of 6 and 12-in. Class B pipe. Noteworthy among awards for the week is 2200 tons of 6 and 8-in. Class B and 12-in. Class C pipe, which was purchased by St. Clair Shores, Mich., from the McWane Cast Iron Pipe Co. Contractors are more active in the Chicago district. They have ordered a round tonnage in the last seven days and will soon close for 2000 to 3000 tons of additional pipe. Small orders, including business taken from the railroads, are more numerous. It is reported that Highland Park, Ill., will soon award a general contract for supplying and laying about 400 tons of cast iron

pipe. Prices are firm at \$34 to \$35, Birmingham, for 6-in. and larger diameters.

Prices per net ton, deliv'd Chicago: Water pipe, 6-in. and over, \$42.20 to \$43.20; 4-in., \$46.20 to \$47.20; Class A and gas pipe, \$4 extra.

Bolts, Nuts and Rivets.—An oil tank program being undertaken by the Texas & Pacific will require close to 300 tons of large rivets. Prices for this commodity are moderately steady at Chicago at \$3, base, per 100 lb. Recent sales in the Southwest, however, point to unsteadiness in that direction.

Cold-Finished Bars.—Announcement at Pittsburgh of a price advance of \$2 a ton has had no effect on this market, where producers continue to quote 2.10c. per lb., Chicago. Specifications are in large volume, and output is near capacity.

Coke.—Shipments have gained a trifle in keeping with improvement in foundry business. Prices are steady and all ovens in this district are lighted.

Steel Corporation's Orders Decreased in July

Unfilled orders on the books of the United States Steel Corporation decreased in July. The total on July 31 was 3,570,927 tons, compared with 3,637,009 tons on June 30—a decrease of 66,082 tons. On July 31, 1927, the corresponding total was 3,142,014 tons. The table gives the reported figures for the last 19 months.

	1928	1927
Jan. 31.....	4,275,947	3,800,177
Feb. 28.....	4,398,189	3,597,119
Mar. 31.....	4,335,206	3,553,140
April 30.....	3,872,133	3,456,132
May 31.....	3,416,822	3,050,941
June 30.....	3,637,009	3,053,246
July 31.....	3,570,927	3,142,014
Aug. 31.....		3,196,037
Sept. 30.....		3,148,113
Oct. 31.....		3,341,040
Nov. 30.....		3,454,444
Dec. 31.....		3,972,874

At the end of April, 1917, the highest total in unfilled orders of the Steel Corporation ever attained was reported at 12,183,193 tons. The lowest figure ever reported was 2,754,757 tons, Dec. 31, 1910.

Trackwork Output Lower in July

Production of trackwork in the United States for July showed a seasonal falling off from the average of the second quarter. According to the American Iron and Steel Institute statistics, the total of switches, switch stands, frogs, crossings, guard rails and appurtenances laid last month for T-rail track of 60 lb. per yd. and over was 11,776 net tons against 13,716 tons in June and 41,368 tons for the second quarter of the year. July trackwork in 1927 was 13,217 tons and the total for the second quarter of 1927 was 48,406 tons.

Philadelphia

Sheet Mills Increase Width on Which Blue Annealed Base Applies—General Demand Slackens

PHILADELPHIA, Aug. 14.—The flow of steel orders, which was in unusually good volume through most of July and the first week of the present month, has been smaller in the past week, but this is explained in some quarters by the fact that it is mid-summer and at the peak of the vacation season. Mills are sufficiently well covered to carry them through a few quiet weeks, and prices on plates, shapes and bars are unchanged, with shapes showing greater firmness. Sellers are beginning seriously to consider 2c., Pittsburgh, on bars and 2.15c., Coatesville, on plates as quotations for fourth quarter, although buyers are not expected to show much interest in material for that delivery for another month or more. The Pennsylvania Railroad will open bids Aug. 21 on estimated requirements of about 25,000 tons of plates, shapes and bars. Individual tonnages of each product are not specified in its inquiry, but as a rule two-thirds or more of the total is plates.

A large sheet producer has announced an advance of \$2 a ton for fourth quarter to 2.75c., Pittsburgh, on black, and 3.50c., Pittsburgh, on galvanized, maintaining blue annealed at 2c. to 2.10c., Pittsburgh, depending upon the width. Several sheet mills have announced a change in the widths of blue annealed sheets on which the 10c. extra applies, the price of 2c. now being for sheets 45 in. and narrower, instead of applying only to sheets 40 in. and narrower. This action was taken, it is said, because increased widths are being offered by continuous mills.

Ferromanganese.—Requisitions against contracts are coming out freely, and there is a small volume of orders for carload lots. Quotations continue at \$105 per ton, seaboard.

Bars.—Demand has tapered, but prices are unchanged at 1.85c., Pittsburgh, or 2.17c., Philadelphia, for desirable specifications, and 1.90c., Pittsburgh, or 2.22c., Philadelphia, for small lots for prompt shipment. Mills are well booked with tonnage and are beginning seriously to consider 2c., Pittsburgh, as a basis for fourth quarter business. Local projects requiring reinforcing bars are small, ranging from specifications for a few tons to less than 100 tons in most cases.

Shapes.—The market is rather inactive, but prices have a slightly firmer tone, 1.95c., Pencoyd, Pa., or 2.01c., Philadelphia, being less common and 2c., Pencoyd, or 2.06c., Philadelphia, to 2c., Bethlehem, or 2.13c., Philadelphia, being more representative of the current market.

Plates.—Mills are fairly well filled with orders and are maintaining prices at 2c. to 2.05c., Coatesville, or

2.10c. to 2.15c., Philadelphia. Sellers are seriously considering 2.15c., Coatesville, or 2.25c., Philadelphia, as a fourth quarter price, although at present consumers are not interested in future buying.

Pig Iron.—Buying of foundry iron is limited to lots ranging from a carload to a few hundred tons, on which \$19.50 per ton, base furnace, applies. Following the recent sizable purchase of basic by a Coatesville consumer, no immediate activity in this grade is expected. Small tonnages of Buffalo iron continue to be sold to eastern Pennsylvania consumers. Low phosphorus iron is quiet. Virginia iron prices are unchanged, but one of the large Virginia cast iron pipe plants is in the market for a sizable tonnage and, with Birmingham furnaces quoting on a basis of about \$15.50 per ton, furnace, the Virginia maker may find it necessary to quote \$19.50 per ton, or lower.

Prices per gross ton at Philadelphia:

East. Pa. No. 2, 1.75 to 2.25 sil.	\$20.26
East. Pa. No. 2X, 2.25 to 2.75 sil.	20.76
East. Pa. No. 1X, 2.25 to 2.75 sil.	21.26
Basic (del'd east. Pa.)	\$18.75 to \$19.25
Gray forge	19.75 to 20.25
Malleable	21.00 to 21.50
Stand. low phos. (f.o.b. N. Y. State furnace)	22.00 to 23.00
Cop. b'r'g low phos. (f.o.b. furnace)	23.00 to 23.50
Va. No. 2 plain, 1.75 to 2.25 sil.	24.54
Va. No. 2X, 2.25 to 2.75 sil.	25.04

Prices, except as specified otherwise, are deliv'd Philadelphia. Freight rates: 76c. to \$1.64 from eastern Pennsylvania furnaces; \$4.54 from Virginia furnaces.

Sheets.—For current delivery mills are still quoting 2c., Pittsburgh, or 2.32c., Philadelphia, for blue annealed; 2.65c., Pittsburgh, or 2.97c., Philadelphia, for black, and 3.40c., Pittsburgh, or 3.72c., Philadelphia, for galvanized. Some mills are quoting a \$2 a ton advance on black and galvanized for

†For 50 bundles or more; 10 to 49 bun., 4.95c. base; 1 to 9 bun., 5.30c. base.

fourth quarter and several producers, including the leading interest in this district, are now quoting 2c. per lb., Pittsburgh, on widths 45 in. and narrower and 2.10c., Pittsburgh, on wider than 45 in., in contrast with the former differential on sheets wider than 40 in. This change is attributed to the fact that continuous sheet mills are now able to offer wider material. Reduction of the discount for cash to ½ of 1 per cent for payment in 10 days by several sheet mills is evidently meeting with considerable opposition from distributors, but general action along this line by all producers is expected by Oct. 1.

Warehouse Business.—The total of orders thus far in August is reported as slightly smaller than in the early part of July, but prices are firm, including the \$2 a ton advance on bars and bar-sized shapes of Aug. 1.

Imports.—In the week ended Aug. 11 a total of 11,950 tons of iron ore arrived at this port from Algeria. Pig iron receipts totaled 1078 tons, of which 658 tons came from India, 267 tons from Norway and 153 tons from the Netherlands. Steel imports consisted of 710 tons of structural shapes and 6 tons of steel bands from Belgium, 263 tons of shapes from France and 78 tons of shapes from Germany. Steel scrap imports totaled 11 tons, from the United Kingdom.

Old Material.—Most grades of scrap show a firmer tendency, although prices are in most cases unchanged. Bundled sheets show an advance of 50c. a ton, on a small purchase by a Harrisburg consumer at \$10.50 a ton, and heavy breakable cast has been bought by the same mill at \$15 and \$15.50, delivered. Stove plate is quotable at \$11 to \$11.50, a small tonnage having been bought recently at \$11.50, delivered eastern Pennsylvania. Part of the present firmness in scrap prices seems to be a reflection of the stronger market situation in the Pittsburgh district.

Prices per gross ton delivered consumers' yards, Philadelphia district:

No. 1 heavy melting steel	\$13.00
Scrap T rails	12.50
No. 2 heavy melting steel	\$10.50 to 11.00
No. 1 railroad wrought	13.50 to 14.50
Bundled sheets (for steel works)	10.00 to 10.50
Machine shop turnings (for steel works)	10.00 to 10.50
Heavy axle turnings (or equiv.)	12.00 to 13.00
Cast borings (for steel works and roll. mill)	10.00 to 10.50
Heavy breakable cast (for steel works)	15.00 to 15.50
Railroad grate bars	11.00 to 11.50
Stove plate (for steel works)	11.00 to 11.50
No. 1 low phos., hvy., 0.04% and under	17.50 to 18.00
Couplers and knuckles	14.50 to 15.00
Rolled steel wheels	14.50 to 15.00
No. 1 blast furnace scrap	9.50 to 10.00
Wrot. iron and soft steel pipes and tubes (new specific.)	12.00 to 12.50
Shafting	16.50 to 17.00

Cast borings (for chem. plant)	14.50 to 15.00
Steel rails for rolling	14.50 to 15.00

New York

Pig Iron Buying Continues Heavy—Three Subway Sections to Take 29,000 Tons of Steel

NEW YORK, Aug. 14.—Demand for pig iron remains heavy. While an increase in foundry melt is evident, there are also indications that large purchases are being made because buyers regard present prices low. Not counting purchases estimated at 20,000 to 30,000 tons by a large maker of heating equipment, sales in this territory for the week totaled over 16,000 tons. The Thatcher Co. closed for about 6000 tons of No. 2 plain for its Garwood, N. J., plant, buying both eastern Pennsylvania and Buffalo iron. The largest new inquiry is from the General Electric Co., calling for close to 5000 tons for fourth quarter shipment. For Bayway, N. J., this company wants 425 tons each of No. 1X and No. 2X; for Lynn, Mass., 400 tons of 3.25 to 3.75 per cent silicon foundry; for Everett, Mass., 400 tons of No. 1X; for Pittsfield, Mass., 600 tons of foundry analyzing 3 per cent and over in silicon; for Schenectady, N. Y., 1000 tons of No. 1X and No. 2X, and for Erie, Pa., 1500 tons. Buyers who have had attractive tonnages to offer have been able to secure low delivered prices, partly on account of barge rates and partly because of selling pressure. Because of the heavy grain movement, barges are scarce and water rates are advancing, with less than \$2.50 a ton from Buffalo to New York harbor hard to obtain. It is understood, however, that accumulations of barge iron at New Jersey ports, moved at lower rates, have been sold in large blocks. One seller continues to quote No. 2X at \$19.51, eastern New Jersey tide-water. This is presumably barge iron on the basis of \$16.50, Buffalo, to which \$2 has been added for the water movement and handling charges and \$1.01 for the railroad freight between such points as Jersey City and Newark and Elizabethport and Newark. At certain points in New Jersey, taking an all-rail rate of \$3.28 from Buffalo, there is little or no economy in buying barge iron. Pig iron selling is more of a study of freight rates than ever before, and aggregate sales of barge iron are much larger than in previous years. One important Buffalo interest that had planned to accumulate a stock at a New Jersey port has been unable to do so because of steady current demands for deliveries. Making allowance for the various combinations of rates, the base price of foundry iron at Buffalo is substantially unchanged at \$16 to \$16.50. Eastern Pennsylvania foundry iron for delivery in this district, however, has weakened, less than \$18.50, furnace, having been done on a large purchase. The Adrian Furnace Co., Dubois, Pa., plans to blow in its stack shortly. There continues to be a demand for Dutch and Indian irons, although they are not competitive with domestic metal on a price basis.

Dutch foundry in No. 1X and lower silicon grades is quoted at \$21 to \$21.50, duty paid port of entry.

Prices per gross ton, deliv'd New York district:

Buffalo No. 2 fdy., sil. 1.75 to 2.25	\$20.91 to \$21.41
*Buf. No. 2, del'd east. N. J.	19.28 to 19.78
No. 2, del'd east. N. J. tidewater	19.01 to 19.51
East. Pa. No. 2 fdy., sil. 1.75 to 2.25	19.89 to 21.52
East. Pa. No. 2X fdy., sil. 2.25 to 2.75	20.39 to 22.02
East. Pa. No. 1X fdy., sil. 2.75 to 3.25	20.89 to 22.52

Freight rates: \$4.91 from Buffalo, \$1.39 to \$2.52 from eastern Pennsylvania.

*Price delivered to New Jersey cities having rate of \$3.28 a ton from Buffalo.

Ferroalloys.—Demand for ferromanganese is very light, but specifications on contract are heavy. A fair business is reported in carload and small lots of spiegeleisen which is quoted at \$33, furnace, for the 19 to 21 per cent alloy, and at \$32, furnace, for the 16 to 19 per cent grade.

Plates, Shapes and Bars.—With new buying practically negligible, little or no change in the price situation has been noticed in the last week. Consumers are well covered for the present quarter, many of them at prices \$1 to \$2 a ton under 1.90c., Pittsburgh, for bars, and 2.05c., Bethlehem, for shapes, but on spot business the higher prices are fairly well adhered to. However, it is still possible to buy plates at 2.17½c., New York, or 2c., Coatesville. Buyers are showing no interest in fourth quarter requirements, and it will be another month before the higher prices announced for that period can be tested. Structural business continues in large volume, and many important projects are pending on which early settlement is expected. With specifications coming in on the heavy sales of June and July, mill schedules are well filled and deliveries are lengthening. Fabricating prices are stronger. Three sections of the New York subway, calling for 29,000 tons of shapes, have come out for bids, and a 4000-ton section has been placed. Action is expected this week on the Reynolds Building, New York, which will take nearly 17,000 tons. The Structural Steel Board of Trade reports July structural lettings in the New York metropolitan district, exclusive of bridges, subway work, etc., of 70,000 tons. This compares with 38,000 tons in the previous month and is the highest monthly total since July, 1927, when awards amounted to 73,000 tons.

Mill prices per lb., deliv'd New York: Soft steel bars, 2.19c. to 2.24c.; plates, 2.12½c. to 2.22½c.; struct. shapes, 2.14½c. to 2.19½c.; bar iron, 2.14c.

Sheets and Strips.—Announcement of a \$2 a ton advance in black and galvanized sheet prices for the fourth quarter has been made by several independent producers. This will make quotations on black sheets 2.75c. per

lb., Pittsburgh, and galvanized, 3.50c., while blue annealed will remain at 2c., for widths up to 45 in., and 2.10c. for the wider sizes. Business, particularly specifications on old contracts, is showing considerable improvement over July, and the higher fourth quarter prices are expected to bring in large tonnages. There has also been some improvement in the demand for strip steel, and prices are steady at 2.90c. to 3c., Pittsburgh and

Cleveland, on the cold-rolled product, and 1.75c. to 2.20c., Pittsburgh, for the hot-rolled material.

Pipe.—An oil company with headquarters in New York is inquiring for 18,000 tons of oil well pipe for shipment to South America. Other large projects are in prospect and the market for this material is expected to be active throughout the remainder of the year. The high rate of building activity in this district is reflected in the steady demand for standard butt-weld pipe.

Reinforcing Bars.—The first two weeks of the month have shown considerable improvement over July both in lettings and in new work in prospect. Nearly 2000 tons is included in jobs of 100 tons or more placed in the last week, the largest being a high school at White Plains, N. Y., which took 500 tons, and a factory building at Norwalk, Conn., calling for 400 tons. At least 3000 tons has been added to pending work. Distributors in this territory are no longer quoting mill prices except in exceptional cases, and the Pittsburgh warehouse price of 2.15c. per lb., or 2.49c., on cars at New York, seems to be definitely established. The practice of not shipping cut-to-length from mills except in 40, 50 and 60-ft. lengths has been generally adopted. Out of New York warehouse the common quotations are 2.80c. per lb. for lots of 5 tons or more, 2.95c., for lots of 2 to 5 tons and 3.24c. for less than 2 tons, all delivered at job.

Cast Iron Pipe.—Southern makers of pressure pipe are still out of this market at present prices of \$34 to \$35 per ton, base Birmingham, and a \$9.25 freight rate into this district. Northern foundries continue to quote \$37.60 to \$38.60 per ton, delivered New York. Atlantic City, N. J., opens bids Aug. 16 on 4500 tons of 60-in. Class A pipe. Hartford, Conn., opened bids Aug. 11 on 150 tons of 8-in. and 325 tons of 12-in. Class D pipe, with alternate prices on Class 250 centrifugal pipe.

Prices per net ton, deliv'd New York:
Water pipe 6-in. and larger, \$37.60 to \$38.60; 4-in. and 5-in., \$42.60 to \$43.60; 3-in., \$52.60 to \$53.60; Class A and gas pipe, \$4 to \$5 extra.

Warehouse Business.—Current buying is confined to small orders, but total bookings compare favorably with those of last month. Competition of foreign material is still encountered in sales of bars and shapes, but lately there has been a slight decrease in the activity of sellers of imported steel, probably as a result of higher prices in European markets. The sheet market is being maintained with only occasional concessions from the range of 3.80c. to 4c. per lb., base, for black and 4.50c. to 4.70c., base, for galvanized.

Coke.—Furnace grade continues to show decided firmness, partly as a result of curtailment of operations and partly because of the purchase last week by a Pittsburgh steel interest of 10 additional carloads a day from several Connellsville producers.

For delivery through next month \$2.75 to \$2.85 per net ton is quoted, but the usual price for shipment beyond Oct. 1 is close to \$3 a ton. Connellsville foundry coke for prompt shipment is quoted at about \$3.75, Connellsville. Special brands are unchanged at \$4.85, ovens, or delivered into this district; \$8.56 per net ton to northern New Jersey, Jersey City and Newark and \$9.44 to New York and Brooklyn. By-product foundry coke is unchanged at \$9 to \$9.40, Newark or Jersey City, and \$10.06 to \$10.29, New York or Brooklyn.

Old Material.—Prices are developing decided firmness and in some cases are slightly higher based on recent sales at advances of 50c. a ton. Holders of scrap are seeking higher prices from brokers and it is reported to be increasingly difficult to obtain material. Recently a consumer at Harrisburg, Pa., bought heavy breakable cast, stove plate and bundled sheets, and, on the basis of these new contracts, brokers are offering \$15 per ton for heavy breakable cast, \$11 per ton for stove plate and \$10 per ton for bundled sheets, delivered to Harrisburg. While there has been no change in the price of heavy melting steel delivered eastern Pennsylvania, some dealers are shipping their steel into

the Pittsburgh district, receiving \$15 to \$15.30 per ton, delivered, on a \$5.30 freight rate, or \$9.70 to \$10 per ton, New York. The eastern Pennsylvania price is unchanged at \$12.50 per ton, delivered. Brokers are buying foundry stove plate at \$10.75 per ton, delivered West Mahwah, N. J., which has a \$2.02 freight rate, and at \$11 per ton delivered Bayonne, N. J., which has a \$1.89 freight rate.

Dealers' buying prices per gross ton, f.o.b. New York:

No. 1 heavy melting steel.	\$9.00 to	\$9.85
Heavy melting steel (yard)	6.75 to	7.25
No. 1 hvy. breakable cast.	10.75 to	11.25
Stove plate (steel works)...	6.75 to	7.25
Locomotive grate bars....	6.75 to	7.25
Machine shop turnings....	6.25 to	6.50
Short shoveling turnings..	6.25 to	6.50
Cast borings (blast furn. or steel works).....	6.00 to	6.50
Mixed borings and turnings	6.00 to	6.50
Steel car axles.....	15.00 to	15.50
Iron car axles.....	23.50 to	24.00
Iron and steel pipe (1 in. dia., not under 2 ft. long)	8.25 to	8.75
Forge fire	6.50 to	6.75
No. 1 railroad wrought....	9.00 to	9.50
No. 1 yard wrot., long....	7.50 to	8.00
Rails for rolling.....	10.00 to	10.50
Cast iron carwheels.....	11.00 to	12.00
Stove plate (foundry)....	8.75 to	9.00
Malleable cast (railroad)...		10.00
Cast borings (chemical)...	10.75 to	11.25

Prices per gross ton, deliv'd local foundries:

No. 1 machy. cast.....	\$14.00 to	\$15.00
No. 1 hvy. cast (columns, bldg. materials, etc.), cupola size	12.00 to	13.00
No. 2 cast (radiators, cast boilers, etc.)	11.50 to	12.50

Cleveland

Finished Steel Prices Have Firmer Tone—Pig Iron Sales Total 84,000 Tons

CLEVELAND, Aug. 14.—The demand for finished steel is holding up unusually well for August. Mills are getting a good volume of specifications against contracts for steel bars. Structural material is fairly active, and plates are moving quite well in small lots. Several of the automobile manufacturers are under heavy production on new models, and the demand from that source is good for this season of the year. Orders for alloy steel bars are in sufficient volume to keep the leading Ohio manufacturer in operation close to capacity, and some of the sheet and hot-rolled strip mills have nearly as much tonnage on their books as earlier in the season, when the operations of automotive industry were larger. While structural lettings in the building field are not numerous, some good tonnage is coming out for bridge work.

The market continues to show a firmer tone on the heavier rolled products. While most consumers of steel bars and structural material are under contract at 1.85c., a moderate volume of small-lot business is being placed and outside mills are holding more closely to 1.90c., Pittsburgh.

A local producer is still quoting steel bars at 1.85c., Cleveland. On plates 1.85c., Pittsburgh, is still rather commonly named, although some small-lot business is being taken at 1.90c.

The Wheeling & Lake Erie Railway has purchased 1000 tons of rails from a Pittsburgh district mill, this order being supplemental to one placed for a similar tonnage reported last week.

In pig iron an active buying movement has developed.

Pig Iron.—Sales increased sharply in the past week. Cleveland interests sold 84,000 tons of pig iron in foundry and malleable grades, making the week one of the best of the year in volume of business. Buying was quite well distributed, though the automotive industry took a good percentage

of the tonnage. While there was a good volume of early shipment orders, the larger part of the business was in contracts covering the remainder of the year. There was also some buying for the fourth quarter by consumers that had already covered for the present quarter. Many foundries evidently feel that they can now forecast their requirements over the remainder of the year and, believing that prices are on rock bottom, see no advantage in postponing buying until later. The tone of the market is firmer. While there has been no advance in prices, furnaces are not showing the disposition to shade quotations in competitive territories that they did a few weeks ago. Cleveland producers claim to be holding firmly to \$16.50, furnace, for foundry and

malleable iron for outside shipment and are taking some business at that price. In Michigan there is a range of \$17.50 to \$18, furnace, shading of the lower price, which recently developed in a few cases, having disappeared. For Cleveland delivery the market is steady at \$17.50, furnace. Shipping orders are very good and show a little gain over July. Among new inquiries is one from the General Electric Co. for 1500 tons of foundry iron for its Erie, Pa., works.

Prices per gross ton at Cleveland:

N'th'n fdy., sil. 1.75 to 2.25.....	\$18.00
S'th'n fdy., sil. 1.75 to 2.25.....	21.50
Malleable	18.00
Ohio silvery, 8 per cent.....	28.00
Basic Valley furnace.....	16.00
Stand. low phos., Valley furn.....	26.50

Prices, except on basic and low phosphorus, are delivered Cleveland. Freight rates: 50c. from local furnaces; \$3 from Jackson, Ohio; \$6 from Birmingham.

Iron Ore.—Lake shipments are holding up to recent volume. The ore balance on Lake Erie docks Aug. 1 was 5,385,007 tons, compared with 5,459,497 tons on the same date a year ago. Receipts at these docks during the month were 6,078,181 tons and for the season 15,124,977 tons, compared with 17,848,739 tons during the same period a year ago. Shipments from Lake Erie docks during July were 4,110,864 tons and for the season 11,410,116 tons, against 13,809,271 tons during the same period last year. Receipts at other Lake ports during July were 2,655,181 tons, compared with 2,281,622 tons during the same period last year.

Semi-Finished Steel.—Specifications are holding up to the recent good volume, and the leading local merchant producer continues to operate at 100 per cent of capacity. There is virtually no new business, as practically all consumers are under contract. Prices are steady at \$32 to \$33, Cleveland, for sheet bars, billets and slabs.

Bolts, Nuts and Rivets.—Orders are fair for August, having fallen but slightly below July in volume. The automotive industry, implement manufacturers and jobbers continue to specify fairly freely for bolts and nuts. Makers of nuts and bolts are operating at about 60 per cent of capacity.

Coke.—The demand for foundry coke is slow, and prices are unchanged at \$7.75, Painesville, for Ohio by-product coke and \$3.50 to \$4.85, ovens, for Connellsville foundry coke. Local by-product domestic coke is quoted at \$6, delivered Cleveland, for egg size.

Sheets.—Orders from the automotive industry are keeping up well, and the demand from other industries shows a gain. Consumers have allowed their stocks to run low and are buying for quick delivery. While the low prices that have appeared for some time are still being named, they are less common than a few weeks ago. Strong efforts will be made to get prices on a higher basis for the fourth quarter, and some mills have already announced advances for that delivery. Galvanized sheets are still available at 3.40c., Pittsburgh, and 3.45c., Valley. Mills are holding to 2.60., Pittsburgh, on black sheets and to 1.90c. on blue annealed.

Strip Steel.—Specifications for hot-rolled strip are good, and the market has a firmer tone in that mills are able in some cases to sell small lots at better than the ruling round-lot price of 1.75c. Cold-rolled strip is rather slow. The demand for this product has been lessened by the increased use on automobiles of one-piece fenders that are made entirely of full-finished sheets. While 2.75c., Cleveland, has been shaded \$2 a ton in Detroit, that price appears to be holding in this territory.

Wire Products.—The demand is moderate. While published quotations appear to be holding in most sections, shading to \$2.35, Cleveland, on wire and \$2.50 on nails is reported in some localities.

Reinforcing Bars.—The demand is light, and price shading continues on billet steel bars for local delivery. Rail steel bars are unchanged at 1.75c., mill.

Warehouse Business.—Orders, particularly for steel bars and structural

material, show a gain over July. A lull is reported in the demand for sheets. Prices generally are firm except on reinforcing bars.

Old Material.—The market has a firmer tone, brought about by more liberal releases by local mills against old contracts. While there is no buying by mills, dealers having old orders to fill are being asked higher prices and, although resisting an advance, they have in some cases paid a little more for scrap than recently. No. 1 heavy melting steel has sold in small lots up to \$13.25, and machine shop turnings, at \$7.50, a 25c. a ton advance on both grades. Purchases of blast furnace scrap were made at \$9.10.

Prices per gross ton delivered consumers' yards:

Basic Open-Hearth Grades		
No. 1 heavy melting steel.....	\$13.00 to	\$13.25
No. 2 heavy melting steel.....	12.25 to	12.50
Compressed sheet steel.....	12.00 to	12.50
Light bundled sheet stamp'gs	11.50 to	11.75
Drop forge flashings.....	11.25 to	11.50
Machine shop turnings.....	7.25 to	7.50
No. 1 railroad wrought.....	11.50 to	12.00

Rails for rolling.....	16.25 to	16.50

Hyb-lum—A New Light Aluminum Alloy

A new aluminum alloy has been placed on the market by the Sheet Aluminum Corporation, Jackson, Mich. It is described as "a balanced aluminum alloy, fundamentally new in composition and in application." It is claimed for this alloy that it combines lightness and strength to a greater degree than any other workable product ever developed on a commercial scale. The new alloy is named "Hyb-lum," protected under United States patent No. 1,579,481.

Research and experimental work was done by Victor N. Hybinette, Jr., with the advice and assistance of his father, an authority on non-ferrous metals. Prior to the introduction of Hyb-lum, the alloying elements of aluminum have been chiefly copper, manganese, silicon and magnesium. In the new alloy, nickel and metals of the chromium group are employed. The total addition of all heavy metals is given as approximately 2 per cent.

Among the qualities claimed for the new alloy are these properties: non-tarnishing, non-corrodibility, resistance to inter-crystalline corrosion, chemical resistivity, welding quality, strength and plasticity, non-fatigue,

low specific gravity, wide limits of temperature in heat treatment and stability after heat treatment, even at elevated temperatures.

The alloy is white, or silver like, without the grayish blue cast of aluminum. It takes a brilliant and lasting polish. It is manufactured in four different classes—A, B, C and D—with the composition virtually the same in all. They vary in physical properties according to annealing, hard rolling to different tempers, cold working and heat treatment. The alloy, it is added, is weldable by means of gas or the electric arc.

Iron Ore Distribution in 1927

In the charts showing the sources and distribution of iron ore in 1927, reproduced on page 357 of THE IRON AGE of Aug. 9, it seems that two errors were made in connection with rail shipments. The Lake Superior Iron Ore Association, which has headquarters at Cleveland, says that the all rail shipments from the Gogebic range should be 150,000 and not 450,000 tons as indicated, and similarly the all rail shipments from the Menominee range should be 10,000 and not 100,000 tons.

San Francisco

Structural Shapes Most Active Product in Coast Markets—Low Prices on Reinforcing Steel

SAN FRANCISCO, Aug. 11 (*By Air Mail*).—August steel sales continue at a fair rate and show improvement over the volume booked last month. Included among the larger lettings of the week were 590 tons of reinforcing bars for the Big Dalton dam at Los Angeles, placed with the Pacific Coast Steel Co., and 455 tons of structural shapes for a bridge at Saugus, Cal., awarded to Claude Fisher Co., Los Angeles. Prices, however, from the viewpoint of the mill and the fabricator are far from satisfactory. Extremely low quotations on reinforcing bars out-of-stock continue in the San Francisco district.

Pig Iron.—Most of the melters have fair-sized stocks and are not keenly interested in the market. Prices are unchanged.

Prices per gross ton at San Francisco:

*Utah basic	\$25.00 to \$26.00
*Utah fdy., sil. 2.75 to 3.25	25.00 to 26.00
**Indian fdy., sil. 2.75 to 3.25	24.00 to 25.00

*Delivered San Francisco.

**Duty paid, f.o.b. cars San Francisco.

Bars.—In addition to the Big Dalton dam project mentioned above, Culver City, Cal., placed 459 tons for a storm drain with Braun, Bryant & Austin. Including smaller awards the total for the week exceeded 2000 tons. New inquiries call for 500 tons for an apartment on Vine Street, Los Angeles, and 160 tons for a bridge at Maupin, Ore. Out-of-stock quotations continue at low levels, and while 2c. is occasionally obtained, most of the business is going at around 1.85c. This compares with a c.i.f. price on domestic structural steel of 2.35c. Merchant bar demand remains quiet; the majority of sales and inquiries call for less than carload lots.

Plates.—Only two inquiries of over 100 tons are up for figures. These involve 7200 tons of 5/16 to 3/8-in. materials for water mains in Oakland for the East Bay Municipal Utility District, bids on which will be opened Aug. 17, and 103 tons for a 36-in. pipe line for the Belle Fourche project in South Dakota for the Bureau of Reclamation, on which the Western Pipe & Steel Co. of San Francisco is low bidder. The Navy Department has placed 131 tons for the

Mare Island yard with an eastern producer. Quotations range from 2.20c. to 2.30c., the former price being quoted by one or two of the small independent producers.

Shapes.—Structural steel continues the most active product on the coast. Awards this week were in excess of 2300 tons. The Minneapolis Steel & Machinery Co. was awarded 650 tons for a high school at Great Falls, Mont. The Star Iron & Steel Works took 350 tons for a chemical plant at Tacoma and the McClintic-Marshall Co. booked 140 tons for a bridge at Sargent, Cal. Considerable new work is planned and architects expect to have working drawings on them completed within the next 60 days. These projects, together with those now up for figures, will exceed 25,000 tons. New inquiries include 250 tons for a hangar at Oakland, 170 tons for an apartment in San Mateo, Cal., and 170 tons for a bridge at Maupin, Ore. Shapes are firm at 2.35c., c.i.f.

Cast Iron Pipe.—W. J. Tobin, Oakland, secured the only award of over 100 tons. This project called for 416 tons of 4 to 12-inch class B pipe for Tracy, Cal. Bids were opened this week on 23,247 tons for Dallas, Tex., and bids will be opened next week on 22,325 tons for distributing mains in Oakland for the East Bay Municipal Utility District. On the latter project alternate bids on different types of pipe will be taken. Compton, Cal., opened bids this week on 148 tons of 2 and 4-in. class B pipe. Los Angeles has come into the market for 318 tons of 2-in. class B pipe, bids to be opened Aug. 14. On Aug. 27, San Diego, Cal., will open bids on 147 tons of 6 to 10-in. class C pipe for the improvement of Garnet Street.

Coke.—Movement of coke has not been heavy of late as foundry operations, especially among the jobbing classes of plants, have shown little or no improvement during the past 30 days and stocks on hand in foundry yards are apparently sufficient to take care of immediate requirements. English beehive is quoted at \$16 a net ton, incoming dock, and by-product coke ranges from \$11.50 to \$13.00 a net ton.

Birmingham

Pig Iron Shipments Keep Pace with Production—Steel Buying Holds Up Well

BIRMINGHAM, Aug. 14.—A fair amount of new pig iron tonnage, mostly for August, is coming in, but the market is not active. Buying is for early melt. Present bookings of merchant producers cover most of August and September production. Quotations continue at the \$15.50 base. Shipments thus far in August are keeping pace with production. In July the three merchant producers reduced their yard stocks, shipping more than they made. No changes have been made in furnace operations during the past three weeks. Seventeen are in blast, eight on foundry, seven on basic, one on ferromanganese and one on recarburizing iron. The Gulf States Steel Co. furnace, now being built, will not be ready until the latter part of next month. The second of the two new blast furnaces of the Tennessee company at Fairfield has been completed but is not in operation.

Prices per gross ton, f.o.b. Birmingham dist. furnaces:

No. 2 fdy., 1.75 to 2.25 sil.	\$15.50
No. 1 fdy., 2.25 to 2.75 sil.	16.00
Basic	\$15.00 to 16.00

Finished Steel.—New business and inquiries are holding up well and continue above the midsummer average. July bookings were above those of the same month last year and also slightly ahead of those in June. August is expected to show similar improvement. Prices are stationary. Structural steel fabricators report a quiet week. Fifteen open-hearth furnaces are being operated, the Tennes-

see company having six on at Fairfield and five at Ensley; the Gulf States Steel Co., three at Alabama City. The rod mill of Gulf States Steel Co. has been closed down for change from steam to electric power. Operations will be resumed the latter part of this month.

Cast Iron Pipe.—Very little new tonnage was booked by the pressure pipe plants during the past week. No awards of any consequence were placed. Operations are steady and at the same rate as for some weeks past. Plant activity so far this month has been largely based on tonnage secured in July. Quotations for third quarter deliveries remain around \$34 to \$35. The soil pipe market is still unsatisfactory and has changed but little.

Old Material.—Gradual improvement is being felt in certain lines, such as No. 1 cast and steel scrap. This has now been noticeable for several weeks. Demand is said to be slightly better. No changes in prices occurred during the past week.

Prices per gross ton, deliv'd Birmingham dist. consumers' yards:

Heavy melting steel.....	\$8.50 to \$9.00
Scrap steel rails.....	11.00 to 11.50
Short shoveling turnings..	7.50 to 8.00
Cast iron borings.....	8.00
Stove plate	13.50
Steel axles	19.00 to 20.00
Iron axles	21.00 to 22.00
No. 1 railroad wrought....	10.00 to 10.50
Rails for rolling.....	13.00
No. 1 cast.....	14.00
Tramcar wheels	12.50 to 13.50
Cast iron carwheels.....	12.00 to 13.00
Cast iron borings, chem...	13.50 to 14.00

St. Louis

Pig Iron Shipments in Satisfactory Volume—But New Buying Is Light—Scrap Slightly Firmer

ST. LOUIS, Aug. 14.—While purchasing of pig iron is not in impressive volume, shipments since the first of this month and specifications against contracts have been satisfactory. Certain melters, notably implement makers and some specialty manufacturers, are busy and in need of raw material. Consumers' stocks generally are low, in some instances considerably under normal even for this time of year. Reserves at blast furnaces serving this district have also been cut, and there is less anxiety to sell than early in the summer. The leading district producer is not pushing fourth quarter sales and is firmer on business for the rest of this quarter. Sales reported totaled 5200 tons, the largest 2000 tons of malleable to an East Side plant. A Kansas jobbing foundry took 400 tons and an Iowa specialty maker engaged 600 tons; the rest was scattered in 50 to 200-ton lots among users in Missouri, Illinois, Iowa and Indiana.

Prices per gross ton at St. Louis:

No. 2 fdy., sil.	1.75 to 2.25, f.o.b.
Granite City, Ill.	\$18.50 to \$19.00
N'th'n No. 2 fdy., deliv'd St. Louis.	19.66
Southern No. 2 fdy., deliv'd.	19.92
Northern malleable, deliv'd.	19.66
Northern basic, deliv'd.	19.66

Freight rates: 81c. Granite City to St. Louis; \$2.16 from Chicago; \$4.42 from Birmingham.

Coke.—The extreme hot weather has caused a slowing down in metallurgical coke, and new buying is at a minimum. Shipments, however, continue to make a fair showing, there being few requests for holdups. Local by-product oven stocks are larger than they were 30 days ago, but not above normal for this season. Prices are unchanged.

Finished Iron and Steel.—Warehousemen report business since the first of this month about up to expectations, with some departments better than looked for. Building material is in good demand, both in the district proper and in the surrounding trade area. Railroads have been swamped with offerings of grain and have kept their shops busy on emer-

gency repairs of box cars. This is reflected in buying by the carriers of a variety of shop supplies. Sheets continue quite active, with the call coming from diversified sources. Sales of small quantities of concrete reinforcing material are reported, but the only jobs of note were 165 tons for the Missouri Baptist Sanitarium, St. Louis, and 275 tons for a hotel at Eighth and Market Streets, St. Louis, both going to the Laclede Steel Co. Fabricators of structural steel are working on old orders, but report no new lettings of consequence.

Old Material.—For the first time in a number of weeks scrap iron and steel dealers report a firmer tone to the market. This is due to higher quotations in Chicago and further east rather than to increased buying by the industries here. Few sales are recorded. Stocks, however, are light, and any increase in demand could easily be reflected in an upturn in values. In face of the lack of demand, railroads continue to unload scrap,

and, singularly enough, are receiving good prices, conditions considered. Latest lists include: Southern Railway, 14,056 tons; Wabash, 2905 tons; Ann Arbor, 532 tons; Great Northern, 83 cars; Nickel Plate, 21 cars; Kansas City Southern, 281 tons; Chicago & Alton, 1240 tons; Texas Pacific, 490 tons; Chesapeake & Ohio, 3562 tons; Frisco, 10 cars, and Louisville & Nashville, 15,978 tons.

Dealers' buying prices, per gross ton, f.o.b. St. Louis district:

Heavy melting steel		\$10.50 to \$11.00
No. 1 locomotive tires		11.75 to 12.00
Heavy shoveling steel		10.50 to 11.00
Miscell. stand.-sec. rails, includ'g frogs, sw'ches and guards, cut apart		12.00 to 12.50
Railroad springs		13.00 to 13.50
Bundled sheets		7.75 to 8.25
No. 2 railroad wrought		11.00 to 11.50
No. 1 busheling		9.00 to 9.50
Cast iron borings		8.25 to 8.75
Iron rails		13.00 to 13.50
Rails for rolling		13.00 to 13.50
Machine shop turnings		7.00 to 7.50
Steel car axles		18.00 to 18.50
Iron car axles		25.50 to 25.75
Wrot. iron bars and trans.		18.25 to 18.75
No. 1 railroad wrought		9.00 to 9.50
Steel rails, less than 3 ft.		15.00 to 15.50
Steel angle bars		11.75 to 12.25
Cast iron carwheels		13.00 to 13.50
No. 1 machinery cast		13.00 to 13.50
Railroad malleable		11.50 to 12.00
No. 1 railroad cast		13.00 to 13.50
Stove plate		11.00 to 11.50
Agricult. malleable		11.50 to 12.00
Relay. rails, 60 lb. and under		20.50 to 23.50
Relay. rails, 70 lb. and over		26.50 to 29.00

Canada

Hotel at Halifax Takes 10,000 Tons of Steel—Like Tonnage Needed for Toronto Building

TORONTO, ONT., Aug. 14.—Interest in the Canadian pig iron markets showed more life during the past week. Foundry and malleable iron sales were in larger volume than in the week previous. Some inquiry is out for last quarter iron. Orders for 500 and 600-ton lots have been closed for delivery this month by water, and it is understood that this iron will be for late fall and winter consumption. Pig iron prices are unchanged.

Prices per gross ton:

	Delivered Toronto
No. 1 fdy., sil.	2.25 to 2.75, \$23.10 to \$23.60
No. 2 fdy., sil.	1.75 to 2.25, 23.10 to 23.60
Malleable	 23.10 to 23.60
	Delivered Montreal
No. 1 fdy., sil.	2.25 to 2.75, 24.50 to 25.00
No. 2 fdy., sil.	1.75 to 2.25, 24.50 to 25.00
Malleable	 24.50 to 25.00
Basic	 23.50 to 24.00
	Imported Iron, Montreal Warehouse
Summerlee	 33.50
Carron	 33.00

Structural Steel.—The general increase in building activities is reflected in a strong demand for structural steel and reinforcing bars. Among the larger contracts awarded in the week was that for the new Canadian National station and hotel at Halifax, N. S., involving 10,000 tons of structural steel, which went to the Dominion Bridge Co., Ltd. The Canadian Bank of Commerce, Toronto, will shortly award contracts in connection with a proposed office building to be erected at King and Jordan

Streets; about 10,000 tons of steel will be required.

Old Material.—Sales for the week showed some improvement over those of the first few days of the month. Heavy melting steel and turnings are moving freely into this district, and some buying of machinery cast and rails has been reported. The weakness in prices of a week or two ago has almost entirely disappeared.

Dealers' buying prices:

	Per Gross Ton	Toronto	Montreal
Heavy melting steel		\$9.00	\$7.00
Rails, scrap		10.00	9.00
No. 1 wrought		9.00	11.00
Machine shop turnings		7.00	5.00
Boiler plate		7.00	6.00
Heavy axle turnings		7.50	6.50
Cast borings		7.50	5.00
Steel turnings		7.00	5.50
Wrought pipe		5.00	5.00
Steel axles		14.00	20.00
Axles, wrought iron		16.00	22.00
No. 1 machinery cast		16.00	13.00
Stove plate		13.00	16.00
Standard carwheels		13.00	13.00
	Per Net Ton		
No. 1 machinery cast		15.00	
Stove plate		9.00	
Standard carwheels		13.00	
Malleable scrap		13.00	

The Georgia Manganese & Iron Co., Atlanta, Ga., has been organized to develop manganese properties at Cartersville, Ga. Perin & Marshall, consulting engineers of New York, are in charge of the experimental work now going on.

Warehouse Prices, f.o.b. St. Louis

	Base per Lb.
Plates and struc. shapes	 3.25c.
Bars, soft steel or iron	 3.15c.
Cold-fin. rounds, shafting, screw stock	 3.75c.

Hot-press. nuts, hex., blank or tapped, 200 lb. or more	 60
Less than 200 lb.	 50

Boston

Heavy Melting Scrap Higher in More Active Market—More Interest in Pig Iron

BOSTON, Aug. 14.—While pig iron sales in the past week probably did not exceed 6000 tons—made up of 2000 tons of Mystic, 2000 tons of Buffalo iron and the rest divided between New York State, western Pennsylvania, Alabama and Indian brands—more interest is being shown in supplies, as attested by a comparatively large number of sales ranging from car lots to 300 tons. Most of the iron sold recently was for fourth quarter shipment; the average foundry has enough on hand and on contract to carry it through the third period. Despite reports from other districts of a firmer undertone to prices, No. 2X iron from the Buffalo district, in car lots, is still available in New England at \$16.50 a ton, furnace, and No. 1X, at \$17. These prices can be shaded on round tonnages. It is reported that bidding for barges has raised water rates. Pig iron prices, however, are as yet unaffected. Indian iron is selling at \$21.25 to \$21.75 a ton on dock here, duty paid.

Foundry iron prices per gross ton deliv'd to most New England points:

*Buffalo, sil. 1.75 to 2.25..	\$20.91 to \$21.41
*Buffalo, sil. 2.25 to 2.75..	21.41 to 21.91
†Buffalo, sil. 1.75 to 2.25..	19.78 to 20.28
†Buffalo, sil. 2.25 to 2.75..	20.28 to 20.78
East. Penn., sil. 1.75 to 2.25	23.15 to 23.65
East. Penn., sil. 2.25 to 2.75	23.65 to 24.15
Va., sil. 1.75 to 2.25.....	25.71
Va., sil. 2.25 to 2.75.....	26.21
Ala., sil. 1.75 to 2.25.....	22.41 to 24.27
Ala., sil. 2.25 to 2.75.....	22.91 to 24.77

Freight rates: \$4.91 all rail and \$3.78 rail and water from Buffalo; \$3.65 from eastern Pennsylvania; \$5.21 all rail from Virginia; \$6.91 to \$8.77 from Alabama.

*All rail rate. †Rail and water rate.

Imports.—Imports of pig iron at this port in July totaled 596 tons, all from India, whereas importations in the previous month were 800 tons, and in July last year, 1979 tons. Imports of ore in July were 9800 tons, all from Newfoundland, as against 18,731 tons

in June and 30,852 tons in July, last year.

Coke.—New England by-product foundry coke remains at \$11 a ton, delivered, within a \$3.10 freight rate zone, that price having been in effect since June 1. Deliveries on contracts are running about on a par with those for July, the best month so far this year. One maker is about a day behind on shipments. The same manufacturer's August deliveries of domestic coke are 50 per cent ahead of those for the same period in July, largely as a result of the installing of new screening equipment.

Cast Iron Pipe.—No open municipal pipe business has been closed. Private sales to cities, towns and companies are holding up well, however, and prices on such business are firm. Newton, Mass., has closed bids on 150 tons of 6-in. pipe but has made no award. The range on 4-in. pipe is \$45.10 to \$46.10 a ton, delivered common Boston freight rate points, and on 6-in. to 12-in., \$41.10 to \$42.10. The usual \$5 differential is asked on Class A and gas pipe.

Warehouse Business.—Warehouse deliveries in the first half of August are about equal to those for the first half of July, and exceed those of the same period in August, 1927. Stocks are well balanced but not heavy. It is still intimated that warehouse prices are to be higher, but nobody has taken the initiative, owing to the keen competition for business.

Old Material.—Reflecting higher prices in the Pittsburgh district, the local market for heavy melting steel is more active and now ranges from \$8.50 to \$9 a ton, on cars shipping point, with an occasional sale at \$9.25, contrasted with \$8 to \$8.50 a week ago. In addition to domestic business, there continues an export demand. One steamer has virtually finished loading 7000 to 7500 tons of steel for Italy. Another boat has started loading 3600 tons for Danzig. The freight rate on this lot is \$5.25 a ton. The Pittsburgh Testing Laboratory is inspecting the material for the shippers. No. 1 steel for export remains at \$9.25 a ton on dock here, and No. 2 at \$8.50 to \$8.75. Pipe is a little more active, with indications of being higher shortly. More orders for steel turnings, forge fire scrap and No. 1 machinery cast have been moved of late, but not in large quantities. The Boston & Maine Railroad yesterday closed bids on about 35 cars of miscellaneous material.

Buying prices per gross ton, f.o.b. Boston rate shipping points:

No. 1 heavy melting steel.	\$8.50 to \$9.25
Scrap T rails.....	7.50 to 8.00
Scrap girder rails.....	7.25 to 7.50
No. 1 railroad wrought....	8.50 to 9.00
No. 1 yard wrought.....	7.00 to 7.50
Machine shop turnings....	5.00 to 5.50
Cast iron borings (steel works and rolling mill)...	5.00 to 5.50
Bundled skeleton, long....	6.50 to 7.00
Forge flashings.....	6.50 to 7.00
Blast furnace borings and turnings.....	5.00 to 5.50
Forge scrap.....	5.50 to 6.00
Shafting.....	11.50 to 12.00
Steel car axles.....	14.50 to 15.00
Wrought pipe 1 in. in diameter (over 2 ft. long)	7.00 to 7.50
Rails for rolling.....	9.50 to 10.00
Cast iron borings, chemical	9.50 to 10.00

Prices per gross ton deliv'd consumers' yards:

Textile cast.....	\$13.50 to \$14.00
No. 1 machinery cast.....	14.00 to 14.50
No. 2 machinery cast.....	12.50 to 13.50
Stove plate.....	10.00 to 10.50
Railroad malleable.....	13.50 to 14.50

Pacific Northwest

Structural Steel and Reinforcing Projects Fairly Active—Inquiry for Plates Improved

SEATTLE, Aug. 11 (*By Air Mail*).—

A fair amount of new structural steel work is in sight, including 650 tons for Prince Rupert docks of the Canadian National Railways; two State highway bridges, one of 415 tons and the other of 445 tons, bids on which are to be opened Aug. 14; new buildings for the Hooker Chemical Co., Tacoma, Wash., 700 tons, bids to be called for shortly, and 145 tons for the Second Avenue extension, Seattle. Other fair-sized jobs are in sight, and it is believed the last three or four months of the year will be quite active.

Plates.—New inquiry for plates is better. On Aug. 13 Tacoma, Wash., is to open bids for 330 tons for extensions to water lines, while Edmonds, Wash., is in the market for 52,000 ft. of 4-in. to 12-in. pipe, bids to be asked in a week or two. Tank quality plates are quoted at 2.20c. to 2.25c., Seattle.

Bars.—Demand for reinforcing steel bars is more active. The Pacific Coast Steel Co. has taken 250 tons for an Everett, Wash., department store, about 100 tons for an addition to the Seattle Ice Cream Co.'s plant, 80 tons for an apartment in Seattle and 80 tons for a bridge at Nisqually, Wash. Contract for the Hanford Street tunnel has been awarded to George Nelson, a Seattle contractor, and it is expected that in a week or ten days contract will be awarded for 700 tons of reinforcing steel for this project.

Warehouse Business.—Local jobbers report that July was a very fair month, and so far August is just as good. One jobber has sent out new price cards under date of Aug. 1, in which prices of galvanized sheets have been reduced 25c. per 100 lb.; small rounds and squares have been advanced from 3c. to 3.50c.; angles ½-in. thick are up 50c. per 100 lb.

Warehouse Prices, f.o.b. Boston

Cincinnati

Pig Iron Market Stronger—Heavy Melting Scrap Advances —Southern Coke Invades District

CINCINNATI, Aug. 14.—Pig iron producers and distributing houses are encouraged by the indications of a stronger and more active market. Northern producers have either raised their prices or are contemplating such action. One maker has circularized an advance of 50c. a ton. Recent sales by other manufacturers have been at better prices. This is true of both Lake and interior Ohio irons. Cleveland foundry iron, at least with one producer, is quoted at \$16.50, furnace, a price also named at a Columbus, Ohio, furnace. Southern furnaces are reported as having delayed opening books for the fourth quarter, and some business is reported as having been lost in consequence. This is also regarded as an indication that the sellers are not willing to take the prices prevailing in the face of what looks like a rising market. As yet, however, no change in prices has been announced in the South. An inquiry is current in this market for 250 tons of Southern iron. The only sizable inquiry is from a southern Ohio buyer for 500 to 1500 tons of Northern iron. One Cincinnati sales office sold 5500 tons in small lots, the largest being 250 tons, and another reported bookings of 1100 tons, the largest order being 200 tons. Sales were scattered over southern Indiana and Ohio. Prices remain at current quotations except that Northern iron is now quoted by several producers at \$16.50, furnace.

Prices per gross ton, deliv'd Cincinnati:

So. Ohio fdy., sil. 1.75 to 2.25	\$19.89
So. Ohio malleable	\$20.14 to 20.89
Ala. fdy., sil. 1.75 to 2.25	19.19
Ala. fdy., sil. 2.25 to 2.75	19.69
Tenn. fdy., sil. 1.75 to 2.25	19.19
So'th'n Ohio silvery 8 per cent	26.89

Freight rates, \$1.89 from Ironton and Jackson, Ohio; \$3.69 from Birmingham.

Finished Material.—Demand for heavy steel products has been well sustained in the past week, specifications on current contracts having been especially liberal. Bars, shapes and plates are steady at 1.90c., base Pittsburgh, for small miscellaneous

lots for immediate delivery, attractive tonnages still being sold in some cases at 1.85c. Fabricators in this district are operating at a fair rate, and gas holder builders have recently booked orders which necessitate an increase in production. Sheet manufacturers report that specifications and fresh bookings have again turned upward after a short period during which incoming business fell off considerably. Unfilled orders are sufficient to insure sheet mill operations at close to 90 per cent of capacity during the next week. Meanwhile, prices have become better stabilized. Blue annealed stock is quoted at 1.90c. to 2c., base Pittsburgh, black sheets at 2.65c. to 2.75c. and galvanized at 3.40c. The wire market apparently is firmer, with common wire nails selling at a minimum of \$2.69 per keg, delivered Cincinnati, or \$2.55, Ironton.

Coke.—Reports continue that the Birmingham coke sellers are invading this territory, especially southern Indiana, where a price of \$3, ovens, has been quoted, while in Ohio outside the Cincinnati territory the prices named are from \$3 to \$3.50, ovens, and in the Cincinnati territory, \$4.25 to \$5.

Current prices locally have not changed. Foundry coke shipments are continuing at the rate reached at the close of July.

Old Material.—The scrap market has been improving, and prices of some grades have advanced. Inquiry is active with buyers bidding up prices. Dealers refuse to consider offers for heavy tonnages at the current market, being unwilling to sell large tonnages in the face of a rising market, especially for deferred or long term delivery. Prices again advanced this week 25c. to 50c. on sheet clippings, machine shop turnings, heavy melting steel, and carwheels. Sales have been in small tonnages but more numerous. Several melters are in the market this week, some for heavy tonnages. The prices that they will pay depend to a large extent on what the railroads obtain for their current offerings.

Dealers' buying prices per gross ton, f.o.b. cars, Cincinnati:

Heavy melting steel	\$11.00 to \$11.50
Scrap rails for melting	10.75 to 11.25
Loose sheet clippings	8.50 to 9.00
Bundled sheets	9.00 to 9.50
Cast iron borings	8.00 to 8.25
Machine shop turnings	7.50 to 8.00
No. 1 busheling	10.00 to 10.50
No. 2 busheling	6.00 to 6.50
Rails for rolling	12.50 to 13.00
No. 1 locomotive tires	12.75 to 13.25
No. 2 railroad wrought	11.00 to 11.50
Short rails	15.75 to 16.25
Cast iron carwheels	11.00 to 11.50
No. 1 machinery cast	15.00 to 15.50
No. 1 railroad cast	12.75 to 13.25
Burnt cast	7.50 to 8.00
Stove plate	8.25 to 8.75
Brake shoes	9.50 to 10.25
Railroad malleable	11.50 to 12.00
Agricultural malleable	10.50 to 11.00

Detroit

Some Slackening in Automobile Production But Rate Is Ahead of That in 1927

DETROIT, Aug. 14.—There has been some slackening in automotive production, but the present volume is still running ahead of that of 1927.

The Buick Motor Co. produced 15,000 cars last month and is running now at approximately 900 a day. The Chevrolet company turned out approximately 120,000 cars and trucks during July, which sets a new July record for the company's production. Only 87,134 units were produced in the same month of 1927. July figures, however, are approximately 13,000 units short of June production.

To date, approximately 200,000 model A units have been produced by the Ford Motor Co. Production schedules are steadily advancing, with a daily output at present of approximately 3000 units. By September, it is expected, the company will be able to increase the rate of progress substantially and for the coming year production may exceed 10,000 units a day. All of the 36 domestic assembly plants of the Ford company are now in operation and payrolls are at the highest level in the history of the company.

Extensive additions are being begun at the Graham-Paige plants, including the one in Detroit, the one at Wayne, Mich., and also the Evans-

ville unit. The new buildings and equipment will increase capacity from 400 to 600 cars a day, and will necessitate an expenditure of approximately \$1,500,000.

The Packard Motor Car Co. shipped 3805 cars in July, compared with 3080 in July last year. The August schedule is set for 4800 units.

The July record for the sale of Studebaker cars stands at 12,600 units, 400 units under June and 3867 units in advance of July, 1927.

The Willys-Overland Co. up to July 15 showed sales of approximately 215,000 units. Sales for all of 1927 were only 171,743.

Old Material.—There has been considerable activity in the scrap market in this district, with several large inquiries pending for delivery to Ohio mills. Advances of 25 to 50c. per ton have been recorded.

Dealers' buying prices per gross ton f.o.b. cars, Detroit:

Hvy. melting and shov.	
steel	\$11.50 to \$12.00
Borings and short turnings	7.25 to 7.75
Long turnings	5.75 to 6.25
No. 1 machinery cast	14.00 to 15.00
Automobile cast	19.00 to 20.50
Hydraul. comp. sheets	10.00 to 10.50
Stove plate	11.00 to 12.00
No. 1 busheling	8.75 to 9.25
Sheet clippings	6.50 to 7.00
Flashings	9.50 to 10.00

Warehouse Prices, f.o.b. Cincinnati

	Base per Lb.
Plates and struc. shapes	3.40c.
Bars, soft steel or iron	3.30c.
New billet reforc. bars	3.15c.

4-in.	38.00
Seamless steel boiler tubes, 2-in.	19.00
4-in.	39.00

Buffalo

Heavy Steel Scrap Advances \$1 a Ton—Active Buying of Pig Iron

BUFFALO, Aug. 14.—Pig iron producers have been booking considerable tonnage, and inquiry has held up well. The lots sought are mostly of moderate size, but there have been some sizable inquiries also. The General Electric Co. is in the market for 5000 tons of foundry and malleable grades for its various plants, and a New England interest wants 4000 tons of foundry. The Kennedy Valve Mfg. Co., Elmira, N. Y., is inquiring for 300 to 500 tons of foundry and malleable. The Massey-Harris Harvester Co., Inc., has purchased 4000 tons of foundry and malleable for Batavia, N. Y., and Canada, the larger portion of the tonnage going to Batavia. Other lots placed include one of 600 tons of foundry; another of 500 tons of malleable and a third of 300 tons of malleable. On business in this district the market is firmly held at \$17, furnace, for No. 2 plain foundry and on malleable with silicon up to 2.75 per cent. One interest announces that it will waive no differentials on Eastern business and that it will adhere to a minimum of \$16.50, Buffalo base, on such shipments.

Prices per gross ton, f.o.b. furnace:

No. 2 fdy., sil. 1.75 to 2.25.....	\$17.00
No. 2X fdy., sil. 2.25 to 2.75.....	17.50
No. 1X fdy., sil. 2.75 to 3.25.....	18.50
Malleable, sil. up to 2.25.....	17.50
Basic.....	\$16.50 to 17.00
Lake Superior charcoal.....	27.28

Finished Steel.—Mill operations have again increased, now averaging close to 90 per cent of capacity. Prices on bars, shapes and plates are being firmly held, and specifications are in good volume. Black sheets are firm at 2.65c., base Pittsburgh, quotations as low as 2.60c. having practically disappeared. Galvanized sheets are 3.50c. to 3.55c., and automobile body sheets, 4c., base Pittsburgh. Strip steel is active, with shipping orders heavy. There is a feeling in the trade that higher strip prices will develop. Pipe specifications are satisfactory. Reinforcing bar awards are small in volume, although numerous.

Old Material.—Sharp competition for the available heavy melting steel drove prices up \$1 a ton this week, and further advances are expected. One purchase of a couple of thousand tons was made at \$14.50, but an offer of \$15 failed to pull out a tonnage. It was reported, though not verified, that one of the larger consumers had

meanwhile bought a tonnage at \$14.75. Most other grades remain quiet.

Prices per gross ton, f.o.b. Buffalo consumers' plants:

Basic Open-Hearth Grades	
No. 1 heavy melting steel.....	\$14.50 to \$15.00
No. 2 heavy melting steel.....	13.00 to 13.25
Scrap rails.....	13.00 to 13.50
Hydraulic comp. sheets.....	13.00 to 13.25
Hand bundled sheets.....	8.00 to 8.50
Drop forge flashings.....	12.00 to 12.50
No. 1 busheling.....	13.00 to 13.25
Hvy. steel axle turnings.....	12.00 to 12.50
Machine shop turnings.....	7.00 to 7.50
No. 1 railroad wrought.....	11.00 to 11.50

Acid Open-Hearth Grades	
R'l'd knuckles and couplers.....	15.00
R'l'd coil and leaf springs.....	15.00 to 16.00
Rolled steel wheels.....	15.00
Low phos. billet and bloom ends.....	16.00 to 16.50

Electric Furnace Grades	
Hvy. steel axle turnings.....	12.00 to 12.50
Short shov. steel turnings.....	9.00 to 9.50

Blast Furnace Grades	
Short shov. steel turnings.....	9.00 to 9.50
Short mixed borings and turnings.....	9.00 to 9.50
Cast iron borings.....	9.00 to 9.50
No. 2 busheling.....	9.00 to 9.25

Rolling Mill Grades	
Steel car axles.....	15.50 to 16.00
Iron axles.....	19.50 to 20.00

Cupola Grades	
No. 1 machinery cast.....	14.25 to 14.75
Stove plate.....	13.00 to 13.25
Locomotive grate bars.....	11.25 to 11.75
Steel rails, 3 ft. and under.....	16.00 to 16.50
Cast iron carwheels.....	12.00 to 12.50

Malleable Grades	
Industrial.....	14.50
Railroad.....	14.50
Agricultural.....	14.50

Youngstown

Sheet & Tube Company Advances Sheets for Fourth Quarter

YOUNGSTOWN, Aug. 14.—Fourth quarter sheet prices have been advanced an average of \$2 per ton by the Youngstown Sheet & Tube Co., and there are indications that other light steel products, such as strips, will also be marked up. The company also advises that, effective Oct. 1, its regular terms of payment on sheets will be changed to read: "Net cash within 30 days, or one-half of 1 per cent discount on f.o.b. mill value for payment within 10 days of date of invoice." This is in line with the policy recently adopted by other sheet manufacturers. In some cases, discounts up to 2 per cent for payment in 10 days have been allowed.

New prices quoted by the Sheet & Tube company are on a Pittsburgh base, with the usual differentials for Gary and Birmingham. The price schedule is: automobile body sheets, 4c. per lb., base; one-pass black sheets, 2.75c. per lb., base; galvanized sheets, 3.60c. per lb., base; blue annealed sheets, under 45 in. wide, 2c. per lb., base, and 2.10c. for 45 in. and wider.

Heavy mill operations rule this week, with 43 or 53 independent open-

hearth furnaces active and sentiment in the industry optimistic. The trend of prices is upward, and it is believed that advances will be realized by the fourth quarter.

Consumption of pig iron is running ahead of production, as furnace yard stocks are being depleted and there is little accumulation to fall back upon. Fall demand is expected to bring a number of blast furnaces into action. The Sheet & Tube company this week started its Grace stack in the Brier Hill group and will later suspend for repairs the Jeannette furnace in the same complement.

Black sheet prices, which were recently down to 2.60c. and 2.65c. per lb., Pittsburgh, are now more frequently 2.75c., and mills are aiming at 2.80c. Firmness is evident in other rolled steel prices, and the tone of the pig iron market is better.

Of 127 sheet mills in the Mahoning Valley, 108 started this week, with four to be added, and 12 of 20 tube mills are under power.

Steel fabricators continue to operate at 90 per cent of capacity or better. The A. M. Byers Co., Pittsburgh, continues to run its Girard puddling department at 60 per cent and rolling mills at 80 per cent. The Newton Steel Co. is operating all of its 20 mills at Newton Falls, Ohio.

Republic Iron & Steel Co. Lowers Cash Discount

Following the lead of the American Rolling Mill Co., the Republic Iron & Steel Co. has announced that on all orders accepted for delivery on and after Oct. 1 next, the terms on sheets and long ternes will be one-half of 1 per cent in 10 days, 30 days net. Discount will be allowed only on the value of the material f.o.b. mill and not on freight to destination.

Equipment Wanted by Frankfort, Ohio

The village of Frankfort, Ohio, will receive bids until Aug. 22 on the following equipment: one Fairbanks-Morse type Y vertical engine No. 562916, 75 hp., 300 r.p.m.; one Fairbanks-Morse alternator, 3-phase, 60-cycle, 1150 volts; one Fairbanks-Morse compound wound generator No. X36422, frame 61, 5 kw., 1400 r.p.m.; one centrifugal water pump; two 400-lb. test air tanks; one Fairbanks-Morse 3 x 3½-in., No. 10494 air compressor; one 200-gal. emergency oil tank; one 10,000-gal. fuel oil tank; one complete switchboard, h.v. 1150, l.v. 110; one No. 26063 single-phase Bullock generator, amp. 77.2; r.p.m. 900, volts 1100; one direct-current Westinghouse generator No. 40, type S.K., 1480 r.p.m., serial No. 1881581; 20 size 3 transformers; eight size 5 transformers; two size 7 transformers; one lot of odd fittings. Bids are to be addressed to D. F. Briggs, Jr., president of the board of public affairs.

Non-Ferrous Metal Markets

Good Buying of Copper, Tin Prices Declining, Lead and Zinc Quiet and Steady

Copper.—Buying of copper for September delivery by domestic consumers has been quite heavy the past week and it is estimated in the trade that they have covered for about two-thirds of their requirements for that month. Foreign buying has also been quite liberal, sales last week being placed at probably 7500 to 8000 tons. Some August delivery as well as September was included in the foreign sales, but considerable metal must still be bought for next month's delivery. Thus far this week the mar-

ket has been quiet with prices continuing very firm at 14.75c., delivered in the Connecticut Valley, and at 14.87½c., in the Central West. Lake copper is moderately active at 14.75c. to 14.87½c., delivered. The official quotation of Copper Exporters, Inc., continues unchanged at 15c., c.i.f., usual European ports. Statistics for July show a decrease in stocks of refined metal of about 4000 tons. Domestic shipments of over 82,000 tons were among the highest on record. Export shipments were large at nearly 57,000 tons.

Tin.—That consumers, both large and small, are not covered very far ahead is indicated by recent developments. They have been buying quite heavily the last week of nearby metal

and it is stated that they have much to buy yet for the remainder of the year. With the East selling freely, however, no scarcity is anticipated and there may even be an increase in the visible supply. With the tin plate industry very active and with automobile makers also running quite full, a large buying power is back of the market. Sales for last week were about 1200 tons, most of which was taken by consumers. Spot and August delivery, which is closely controlled and commands a good premium, was dealt in principally. Monday consumers took about 200 tons. Tuesday the market was very dull with spot Straits tin quoted at 48.25c., New York. Dealers are not at all active in the present market. Ar-

rivals thus far this month have been 2175 tons, with 7620 tons reported afloat.

Lead.—Quotations have been advancing in London, but thus far without any particular effect on this market. Prices here are firm and unchanged at 6c., St. Louis, and at 6.20c., New York, the latter being the quotation of the leading interest. Sales have been confined largely to carload and small lots for spot and August delivery, although one day last week a fair business was done in September delivery, interest in which is accumulating, some sales being made each day. Thus far producers have not been selling October delivery.

Zinc.—Consumer buying has been in fairly large volume the past week, but the feature has been the firmness of prices which continue unchanged at 6.25c., East St. Louis, or 6.60c., New York. Open inquiry has not been large, but considerable business has been done very quietly. In general the market has been featureless. In Saturday's Joplin market, ore prices were unchanged at \$40 a ton, which has prevailed since some time in May. Sales of ore for the week were about 9690 tons, with the output 12,500 tons, and with the week's shipments about 11,250 tons, leaving stocks on Aug. 11 at about 36,450

tons. This compares with about 50,000 tons on Jan. 1. Consuming inquiry Monday and Tuesday was only moderate.

Antimony.—Chinese metal for spot delivery is quoted at 10c. to 10.25c., New York, duty paid, with futures bringing a slight premium.

Nickel.—Quotations are unchanged with ingot nickel at 35c., with shot nickel at 36c. and with electrolytic nickel at 37c. per lb. in wholesale lots.

Aluminum.—Virgin metal, 98 to 99 per cent pure, is unchanged at 23.90c., delivered.

Non-Ferrous Metals at Chicago

CHICAGO, Aug. 14.—Individual sales are small but the aggregate tonnage is of fair size. Prompt delivery is expected by buyers. The old metal market is without feature.

Prices, per lb., in carload lots: Lake copper, 15.25c.; tin, 49.50c.; lead, 6.10c.; zinc, 6.35c.; in less-than-carload lots, antimony, 11c. On old metals we quote copper wire, crucible shapes and copper clips, 10.75c.; copper bottoms, 9.75c.; red brass, 9.50c.; yellow brass, 7.25c.; lead pipe, 4.75c.; zinc, 3.50c.; pewter, No. 1, 30c.; tin foil 36.25c.; block tin, 45.25c.; aluminum, 12c.; all being dealers' prices for less-than-carload lots.

school, to Minnesota Steel & Machinery Co.

INDEX, WASH., 203 tons, bridge for Wallace Falls Timber Co., to Wallace Bridge & Structural Steel Co.

TACOMA, WASH., 350 tons, electric-chemical plant, to Star Iron & Steel Works. MARE ISLAND, CAL., 149 tons sheet piling for Government, to an unnamed interest.

MARE ISLAND, 131 tons plates for Government, to unnamed interest.

TEXAS AND PACIFIC RAILROAD, 4200 tons for bridge work, to an unnamed fabricator.

PALO ALTO, CAL., 166 tons, telephone building, to Judson-Pacific Co.

SACRAMENTO, CAL., 455 tons, bridge at Saugus, Cal., to Claude Fisher, Los Angeles.

SACRAMENTO, 140 tons, bridge at Sargent, Cal., to McClintic-Marshall Co.

Structural Projects Pending

Inquiries for fabricated steel work include the following:

BOSTON, 200 tons, city bridge on River Street.

NEW YORK, 29,000 tons, subway work; 6000 tons in section 2, route 106, bids Aug. 21; 20,000 tons in section 5, route 107, bids Aug. 31, and 3000 tons in section 5-B, route 109, bids Aug. 28.

BROOKLYN, 6000 tons, store building for Abraham & Straus.

ATLANTIC CITY, N. J., 350 tons, garage for Chalfonte-Haddon Hall.

LANSDOWNE, PA., 1000 tons, apartment building; Graham-Chambley Co., Philadelphia, general contractor.

MANSFIELD, OHIO, 200 tons, Hocking bank building.

DENVER, COLO., 103 tons plates for 36-in. pipe for Belle Fourche project in South Dakota for United States Bureau of Reclamation; Western Pipe & Steel Co., San Francisco, low bidder.

SAN MATEO, CAL., 170 tons, apartment building; bids being taken.

OAKLAND, CAL., 250 tons, hangar No. 4 for Port Commission; bids Aug. 13.

MAUPIN, ORE., 170 tons, bridge over Deschutes River; bids Aug. 14.

Record July Building in 37 Eastern States

July construction contracts in the territory east of the Rocky Mountains reached a total of \$583,432,400, according to F. W. Dodge Corporation. The area covered in this record consists of 37 States and includes about 91 per cent of the total country. The above figure was the highest July contract total on record. It was 9 per cent ahead of the total for the same month of last year, but there was a drop of 10 per cent from the total for June of this year.

Last month's record brought the total amount of new building and engineering work started since the first of this year up to \$4,028,299,900, establishing a new high record for new construction contracted for during the first seven months. The increase over the first seven months of 1927 was 8 per cent.

New work contemplated in the 37 States during the past month reached a total of \$647,682,700, being a loss of 37 per cent from the amount reported in the preceding month and a drop of 7 per cent from the amount reported in July of last year.

Fabricated Structural Steel

Additional New York Subway Work Calls for 29,000 Tons—Awards of Only 25,000 Tons

STRUCTURAL awards of 25,000 tons were less than half the average of recent weeks and included no sizable projects except a section of the New York subway requiring 4000 tons. The 37,250 tons called for in new projects was made up largely of three sections of the New York subway, requiring 29,000 tons, and a department store building in Brooklyn, which will take 6000 tons. Awards follow:

WORCESTER, MASS., 1600 tons, telephone building, to New England Structural Co.

QUINCY, MASS., 410 tons, stores and offices, to Palmer Steel Co.

NEW YORK, 4000 tons, section 1-A, route 8, of New York subway; from D. C. Serber, Inc., to Bethlehem Steel Co.

NEW YORK, 700 tons, column cores for Lehigh Valley warehouse at 144th Street and Girard Avenue, to Levering & Garrigues Co.

BROOKLYN, 600 tons, sheet piling for new subway, to Jones & Laughlin Steel Corporation.

OLEAN, N. Y., 250 tons, East State Street bridge, to McClintic-Marshall Co.

CATSKILL, N. Y., 110 tons, highway bridge, to American Bridge Co.

ADAMS STATION, N. J., 400 tons, highway bridge, to Phoenix Bridge Co.

TRENTON, N. J., 700 tons, second unit of State office building, to American Bridge Co.

PHILADELPHIA 800 tons, service elevators for Strawbridge & Clothier department store, to Bethlehem Steel Co.

BETHESDA, MD., 100 tons, highway bridge, to American Bridge Co.

COVINGTON, VA., 1500 tons, factory building for Industrial Rayon Co., to Virginia Bridge & Iron Co.

PENNSYLVANIA RAILROAD, 200 tons, two bridges in Ohio, to American Bridge Co.

ERIE RAILROAD, 425 tons, bridge at Youngstown, Ohio, to Jones & Laughlin Steel Corporation.

CLAIRTON, PA., 300 tons, two oil tanks for Carnegie Steel Co., to Riter-Conley Co.

PITTSBURGH, 2800 tons, 18 river barges for Union Barge Line Corporation, to American Bridge Co. and Dravo Contracting Co.; each nine barges and 1400 tons.

MEADVILLE, PA., 110 tons, Arter Hall, Allegheny College, to John Eichleay, Jr., Co.

YOUNGSTOWN, 180 tons, highway bridge, to Pittsburgh-Des Moines Steel Co.

VERMILION, OHIO, 130 tons, bridge for Ohio State Highway Department, to Fort Pitt Bridge Works.

BELLE, W. VA., 650 tons, 750,000-cu. ft. gas holder, to Stacey Mfg. Co.

LOUISVILLE, 1200 tons, warehouse, for Henry Vogt Co., to McClintic-Marshall Co.

STATE OF MICHIGAN, 170 tons, State highway bridge, to Massillon Bridge & Structural Co.

PITTSBURG, IND., 1100 tons, bridge across White River, to Vincennes Bridge Co.

MARSEILLES, ILL., 700 tons, bridge, to Mount Vernon Bridge Co.

CHICAGO, 500 tons, Goldberg Building, to McClintic-Marshall Co.

GREAT FALLS, MONT., 650 tons, high

PERSONAL

H. B. DEMPSEY and COMMANDER H. T. DYER have formed the Dempsey Furnace Co., Inc., 110 East Forty-second Street, New York, to design, manufacture and erect industrial furnaces formerly produced by the old Dempsey Furnace Co., which since August, 1925, has been operated as the Dempsey Furnace Division of the W. N. Best Corporation. All assets of the old company have been acquired and Mr. Dempsey will be president of the new company and Mr. Dyer, vice-president. The latter was formerly chief engineer of the Peabody Engineering Corporation.

H. M. CLYMER has been elected vice-president of the Lebanon Iron Co., Lebanon, Pa.

ALEXANDER GUTTMAN, New York, has been appointed chairman of a committee of common stockholders of the Wickwire Spencer Steel Co., Inc., formed to protect their investment.

M. M. HEDGES has been named president of the Hedges-Walsh-Weidner Boiler Co., Chattanooga, Tenn., formed recently by a merger of the Casey-Hedges Co. and the Walsh & Weidner Boiler Co.

WILLIAM HARRIS, East Bridgewater, Mass., recently was made superintendent of the Government foundry in the Panama Canal Zone.

GIFFORD K. SIMONDS, general manager of the Simonds Saw & Steel Co.,

Fitchburg, Mass., has been made a director of the International Paper Co.

F. H. MOVIEL has resigned as manager of the machinery division of the American Foundry Equipment Co., Mishawaka, Ind.

H. C. PETERSON, recently associated with the Underwriters' Laboratories, Chicago, has been made engineer for the Bundy Tubing Co., Detroit, according to an announcement by H. W. BUNDY, president of the company.

PAUL A. IVY, until recently associated with the American Cast Iron Pipe Co., Birmingham, has been elected vice-president of the National Cast Iron Pipe Co., of the same city. E. E. LINTHICUM continues as president of the National company. A. P. FINCK, who has been works manager, has been named general manager; W. H. SAUNDERS, assistant general manager, and A. M. FORD, chief engineer.

JOHN H. BODE has resigned as president and general manager of the Wellman-Seaver-Morgan Co., Cleveland, and has been succeeded by GEORGE W. BURRELL, formerly vice-president, who retired two years ago to take a rest after 27 years' affiliation with the company. Mr. Bode had been with the company about two years.

GEORGE D. BRANSTON has resigned

as manager of railroad material sales for the Jones & Laughlin Steel Corporation, Pittsburgh, to become associated, Sept. 1, with the Campbell, Wyant & Cannon Foundry Co., Muskegon, Mich., as comptroller and director. Prior to his connection with Jones & Laughlin corporation, Mr. Branston was for several years secretary and treasurer of Manning, Maxwell & Moore, Inc., New York.

FRANK F. CORBY, formerly vice-president in charge of sales for the Steel & Tube Co. of America, and more recently Pacific Coast representative for the A. M. Byers Co., has become associated with the Jones & Laughlin Steel Corporation as special Pacific Coast representative.

W. ROY MOORE has been appointed sales manager of an office which has been opened at room 1205, 71 Murray Street, New York, by the Billings & Spencer Co., Hartford, Conn., to serve the metropolitan New York and Philadelphia territories. ROBERT C. SMITH will be associated with Mr. Moore and will have charge of export sales.

ALBERT E. GROVER has been appointed cost consultant for the National Machine Tool Builders' Association and will begin work immediately in his new association. He has had many years of experience as cost accountant and comptroller of business houses and is a charter member of the Cleveland chapter of the National Association of Cost Accountants having served as president of the chapter in 1926 and 1927. Since 1923 he has been engaged in the installing of cost systems on his own account.

Obituary

C. KEMBLE BALDWIN, vice-president of the Robins Conveying Belt Co., New York, died in Los Angeles on Aug. 9, after a lingering illness. He was born at Philadelphia in 1873 and was graduated from Lehigh University in 1895.

HARRY E. HIGGINS, formerly vice-president of the Otis Steel Co., Cleveland, was instantly killed in an airplane accident at Palo Alto, Cal., Aug. 11. He had severed his connection with the Otis company several years ago and last year disposed of other business interests in Cleveland and moved to California.

JAMES B. LAUGHLIN, director and member of the executive committee Jones & Laughlin Steel Corporation, and its treasurer from 1904 to 1910, died at his summer home in Hyannis Port, Mass., Aug. 12. He was a grandson of James Laughlin, one of the founders of the Jones & Laughlin corporation, and was born in Pittsburgh 63 years ago. Following his graduation

from Princeton University in 1886 he joined the Jones & Laughlin company, and was superintendent of the Eliza furnaces from 1894 to 1900.

CAPT. WARREN ELSEY, formerly transportation master of the Vesta Coal Co. subsidiary of the Jones & Laughlin Steel Corporation, Pittsburgh, died at his home in Philadelphia, Aug. 11. He had been identified almost continuously with river transportation activities of the Jones & Laughlin organization from 1864 until his retirement about three years ago. He was born near Portsmouth, Ohio, in 1848. A son, P. C. Elsey, now is transportation master for the Vesta Coal Co., and another, Warren Elsey, Jr., is assistant superintendent of the Central Iron & Steel Co., Harrisburg, Pa.

SETH BARHAM, assistant treasurer of the American Radiator Co., New York, died on Aug. 13, after a lingering illness. He was also vice-president of the Humphreys Coal & Coke Co., Greensburg, Pa., and the Tonawanda Iron Corporation, North Tonawanda, N. Y., subsidiaries of the

Radiator Company, and had been identified with that organization for many years.

JOSEPH D. BASCOM, chairman of the board and one of the founders of the Broderick & Bascom Rope Co., St. Louis, died recently at his home in that city. He was 78 years of age and was born and had lived his entire life in St. Louis. In 1878, with John J. Broderick, he founded the firm of which he was head at the time of his death.

ALONZO C. PACKER, general inspector H. K. Porter Co., Pittsburgh, and inventor of the Packer locomotive truck, now in general use on American railroads, died at St. Francis Hospital, Pittsburgh, Aug. 6. He was born in Strattanville, Pa., April 29, 1852, and had been identified with the Porter company for 57 years.

FRANK W. GOODRICH, for 20 years plant superintendent for the Graton & Knight Co., Worcester, Mass., died on Aug. 10 at his home in that city, aged 56 years. He had been identified with the company for 40 years.

REINFORCING STEEL

AWARDS of 4400 tons reported during the last week include no jobs of outstanding size. Included in the 3500 tons called for by new projects are 1000 tons for a loft building in New York and a similar tonnage for three sections of the subway in the same city. Awards follow:

NORWALK, CONN., 400 tons, factory building for Sunfast Hat Co., to National Bridge Works, Inc.

WHITE PLAINS, N. Y., 500 tons, high school, to Ferro Building Products Co.

NEW YORK, 300 tons, sewer work in Queens; from Necaro Construction Co., general contractor, to Concrete Steel Co.

NEW YORK, 250 tons, subway section 1-A, route 8; from D. C. Serber, Inc., general contractor, to Igoo Brothers.

NEW YORK, 100 tons, Seward Park High School, to Carroll-McCreary Co., Inc.

NEW YORK, 100 tons, Queens Vocational School, to Tidewater Structural Materials Corporation.

NEWARK, N. J., 110 tons, First Avenue public school, to Tidewater Structural Materials Corporation.

BUFFALO, 100 tons, Bird Island pier, to a Buffalo maker.

CHICAGO, 160 tons, Palmolive-Peet Building, to Kalman Steel Co.

CHICAGO, 220 tons, Belmont Bank Building, to Truscon Steel Co.

CHICAGO, 160 tons, Victor Mfg. & Gasket Co., to an unnamed bidder.

CHICAGO, 120 tons, alterations to Olympic Theatre, to Duffin Iron Co., local.

CHICAGO, 175 tons of rail steel bars, Twelfth Street store, to an unnamed bidder.

EAST CHICAGO, IND., 200 tons of rail steel bars, bank building, to Barton Spiderweb System, Inc.

STATE OF ILLINOIS, 200 tons of rail steel bars, road work, to Olney J. Dean & Co.

LOS ANGELES, 589 tons, Big Dalton Dam, to Pacific Coast Steel Co.

CULVER CITY, CAL., 459 tons, storm drain, to Braun, Bryant & Austin.

VERNON, CAL., 181 tons, bridge over Los Angeles River at Soto Street, to Pozzo Construction Co.

OAKLAND, CAL., 104 tons, bridge over Niles Canyon, to Pacific Coast Steel Co.

SACRAMENTO, CAL., 147 tons, bridge at Saugus, Cal., to Barrett & Hilp, San Francisco.

Reinforcing Bars Pending

Inquiries for reinforcing steel bars include the following:

NEW YORK, 1000 tons, loft building for B. B. Davis at Hudson, Dominick and Broome Streets.

NEW YORK, unstated tonnage, miscellaneous work in Mott Haven yard of New York, New Haven & Hartford Railroad.

NEW YORK, 1000 tons, three sections of subway; 300 tons in section 1, route 108, Triest Contracting Corporation, low bidder; 400 tons in section 2, route 106, bids Aug. 21, and 300 tons in section 5, route 107, bids Aug. 24.

STATE OF NEW JERSEY, 250 tons, highway work; 150 tons on route 25, bids Aug. 20, and 100 tons on route 17, bids in.

KEARNY, N. J., 300 tons, factory buildings Nos. 51 and 52 for Western Electric Co., Inc.; Austin Co., Philadelphia, general contractor.

CHICAGO, 120 tons, garage at Twenty-sixth Street and Michigan Boulevard.

CHICAGO, 150 tons, garage for Swift & Co.

CHICAGO, 315 tons, Judah Studio; Holabird & Root, architects.

MAUPIN, ORE., 160 tons, bridge over Deschutes River; bids Aug. 14.

LOS ANGELES, 500 tons, office building, Hollywood and Vine Streets; bids soon.

Notable Activity in New England

Reflecting the betterment in the small tool business, the Greenfield Tap & Die Corporation, Greenfield, Mass., during the first six months of this year did more business than in the corresponding period last year. The average of customers' orders was at the highest point since 1920. Furthermore, indications are the last six months of 1928 will exceed 1927 in volume and value.

The Standard Screw Co., Hartford, Conn., reports production and new orders running decidedly ahead of the same period last year, with first-half sales quite satisfactory.

The Geometric Tool Co., New Haven, Conn., reports no change in prices, but any movement would be upward. The plant is operating practically full and its stock of raw and finished materials is lower than at any time during the past 10 years. Sales through offices in New York, Philadelphia, Baltimore, Pittsburgh and Cincinnati are less than a year ago; those in northern territories, including Chicago, Indianapolis, Detroit, Toledo, Cleveland and upper New York State are far ahead of last year, while in New England they are just about holding their own. The West is below last year. In contrast, the export business is on the upturn and looks encouraging.

The Pratt & Whitney Co., Hartford, Conn., during the first half of 1928 ran its plant at capacity, with a day and night shift in some departments. Sales were considerably ahead of last year for the corresponding period. The company has sufficient business already booked and future business practically assured to warrant the statement that the plant will be operated full during the remainder of 1928 and into the first quarter of 1929. In addition to an excellent domestic business, the firm is well booked up on foreign orders.

Continued High Activity in Automobiles

Production of passenger cars and trucks in July in the United States and Canada, according to *Automotive Industries*, slightly exceeded 400,000, bringing the total for the first seven months to about 2,725,000. Production in July last year was 279,456 and the first seven months 2,475,150. In 1926, the industry's record year, July output amounted to 374,483 and the first seven months to 2,857,936. Production in August is running about 25 per cent higher than in the same month last year, a rate that unquestionably will be continued through the month. Factories which have recently introduced new models are in

several instances more than a month behind on deliveries and increasing operations during the month will serve only to reduce the number of orders carried into September. The Ford company, now building about 4000 cars daily, is still several months behind orders.

British Iron and Steel Output Lower in July

LONDON, ENGLAND, Aug. 13 (*By Cable*).—Pig iron production in July was 537,800 gross tons, and that of steel ingots and steel castings was 666,900 tons. Both show a decrease from the June totals.

A comparison of the July output with that of the six preceding months of the year, and with the monthly rate for previous years is as follows, in gross tons:

	Pig Iron, Tons	Steel Ingots and Castings, Tons
1913—Av. monthly..	855,000	638,600
1920—Av. monthly..	669,500	755,600
1922—Av. monthly..	408,500	490,100
1923—Av. monthly..	620,000	706,800
1924—Av. monthly..	609,900	685,100
1925—Av. monthly..	519,700	616,400
1926—Av. monthly..	203,500	296,700
1927—Av. monthly..	607,800	758,200
1928—January	560,600	626,200
1928—February	550,800	764,400
1928—March	592,600	793,300
1928—April	555,000	644,100
1928—May	591,500	752,700
1928—June	563,700	709,500
1928—July	537,800	666,900

Stack to Go Out After Operating Nine Years

After continuous operation for nearly nine years, during which it has produced over 1,835,000 tons of pig iron, breaking, it is believed, all blast furnace operation and production records, "A" stack of the Toledo Furnace Co., Toledo, Ohio, operated by Pickands, Mather & Co., Cleveland, will be blown out next week. This furnace, after being rebuilt, went in blast Nov. 6, 1919, and it has not been cold since that date, having undergone only a few minor repairs such as patching the lining at the stock line. The lining at present is in good condition and, it is believed, would last a year or two longer, but most of the furnace equipment is literally worn out. For the past year the furnace has had a daily output of approximately 625 tons, or more than it produced when it was first built. The furnace will be relined, the hearth enlarged from 18 ft. to 19 ft. 6 in., and a new electric hoisting engine will be installed to replace the present steam engine.

Railroad Equipment

Missouri Pacific has ordered 100 automobile cars from American Car & Foundry Co.

Erie Railroad is inquiring for five 120-ton, depressed center flat cars.

Machinery Markets and News of the Works

Good Year for Machine Tools

Business in First Seven Months About Equal to That in 1919,
the Industry's Record Post-War Year

MACHINE tool business in the first seven months of 1928 was about equal to that in the first half of 1919, the industry's best post-war year, and is more than double the average of the corresponding number of months in 1922, 1923 or 1924, according to the monthly report of the National Machine Tool Builders' Association.

Figures compiled by the association on July orders and shipments show a slight dip downward for that month. The report says that "the present slacking off may be seasonal, as all indicators point to a continued good volume of orders, and the August reports may again show an upturn over June and July."

Shipments of machine tools in July reflected the vacation season, dropping about 6 per cent below those in June, but this helped to lift the volume of unfilled orders at the end of July to a figure approximately twice that of the orders received during the month.

The outlook for the machine tool industry is regarded as satisfactory, and comment is made by the association that the coming political campaign has not thus far disturbed business.

"General business ought gradually to be stimulated by the usual fall activity," says the report. "From August on it appears that we ought to have a good fall business in the machine tool line. The only possible dampening influence would be the effect of excessive speculation on the purchasing power of machine tool users. That, however, is not likely to be extremely serious and is a possibility rather than a probability."

"The business prospects of nearly all industries using machine tools are quite good. The oil producers, the shipyards and the railroad equipment concerns are the only tool buying groups whose present prospects can be classed as poor—and these groups are a relatively small proportion of our industry's customers."

August has brought a continued steady demand in nearly all market centers. The demand comes from a wide circle of manufacturing companies. Absences of executives on vacation this month have caused some delays in the placing of orders for equipment quoted on, but the volume of inquiry indicates that plans are under way for an upswing in buying activities in the early fall.

New York

NEW YORK, Aug. 14.—Machine tool buying in the first two weeks of August has proceeded at a steady rate, and while orders may not equal the exceptional totals of June and July, the outlook continues very promising. A good many executives of manufacturing plants are away on vacation this month, a situation which tends to delay the placing of orders on which quotations have been submitted, but the number of inquiries being received indicates that many manufacturers expect a continued high rate of manufacturing activities in the fall.

Russell, Burdsall & Ward Co., Port Chester, N. Y., has awarded general contract to Austin Co. for two-story addition to branch plant at Sterling, Ill., 65 x 160 ft., reported to cost upward of \$70,000

with equipment. Company is reported considering another addition in same plant.

Packard Motor Car Co. of New York, Broadway and Sixty-first Street, will take bids in September for new multi-story service, repair and garage building at 773-87 Eleventh Avenue, to cost more than \$1,500,000 with equipment. It is proposed to remove present mechanical plant at Long Island City to new location and provide additional capacity. Albert Kahn, Marquette Building, Detroit, and E. S. Parker, 119 West Fifty-seventh Street, New York, are architects.

R. H. Macy & Co., Thirty-fourth Street and Broadway, New York, have acquired property, 325 x 340 ft., at Newark, as site for multi-story storage and distributing plant, to include installation of mechanical-handling equipment, etc. Project is reported to cost more than \$200,000.

Shampan & Shampan, 188 Montague

Street, Brooklyn, architects, have filed plans for a two-story automobile service, repair and garage building, 89 x 180 ft., at Long Island City, to cost about \$180,000 with equipment; also for a similar two-story building, 100 x 277 ft., in Bronx, to cost more than \$200,000 with equipment.

Board of Education, Elmont, N. Y., is said to be planning installation of manual training equipment in new high school to cost in excess of \$750,000, for which bids will be asked in about 60 days on general contract. Knepper & Morris, 171 Madison Avenue, New York, are architects.

Central Foundry Co., 1434 Fulton Street, Brooklyn, has awarded general contract to P. M. Sterling, 33 West Forty-second Street, New York, for two-story branch storage and distributing plant at Forest Hills, L. I., to cost about \$40,000. Bly & Hamann, 551 Nostrand Avenue, Brooklyn, are architects.

C. N. Shinston, 2 Columbus Circle, New York, architect, has plans for one and two-story automobile service, repair and garage building, 100 x 200 ft., to cost close to \$100,000 with equipment.

National Air Transport, Inc., 420 Lexington Avenue, New York, is reported planning new air terminal at Dry Harbor, Middle Village, N. Y., including hangars, repair and reconditioning shops, oil storage and distributing building and other units.

Standard Oil Co. of New Jersey, 26 Broadway, New York, has authorized expansion at its refinery at Bayway, Elizabeth, N. J., to include extensions in gasoline refining division to increase output by 4000 bbl. per day, to cost about \$1,500,000 with machinery.

Board of Education, New Milford, N. J., is considering installation of manual training equipment in new two-story and basement high school to cost \$350,000, for which bids will be asked at once on general contract. Ernest Sibley, Bluff Road, Palisades, N. J., is architect.

Globe-Wernicke Corporation, Cincinnati, manufacturer of filing equipment, desks and kindred products, has purchased Steel Equipment Corporation, Avenel, N. J., manufacturer of metal business furniture, safes, etc., and will consolidate with its organization. Avenel plant will be developed as Eastern manufacturing and distributing works, and expansion is planned. Purchasing company is said to plan organization of new company under name of Business Service Bureau, to take over and merge both organizations.

Board of Education, Dunellen, N. J., is said to be planning installation of manual training equipment in new junior high school to cost in excess of \$250,000, for which plans will be drawn by William Bragdon, 275 Morris Avenue, Elizabeth, N. J., and A. M. Korff, 203 Park Avenue, Plainfield, N. J., associated architects.

Eaton-Kent, Inc., 17 Academy Street, Newark, manufacturer of heating equipment and industrial apparatus, has leased a portion of former plant of Heller Brothers Co. and will equip for a machine shop and distributing service.

The Crane Market

THERE is very little new inquiry for locomotive or overhead traveling cranes, but sellers do not seem to expect much activity during the present midsummer season. Both in locomotive and overhead cranes there is some sizable export business pending from contracts being executed by American companies. In addition to the shop construction for the Turkish railroads, Fox Brothers International Co., New York, has contracts for the airway terminals of the new line to operate between Spain and Argentina. No action has been taken as yet by Dwight P. Robinson & Co., New York, on

the locomotive cranes and steam shovels for export to a contract in Argentina. In overhead cranes, the General Electric Co., Schenectady, N. Y., is about to close on several small capacity low-headroom cranes.

Among recent purchasers are:

Passaic Valley Sewerage Commission, Passaic, N. J., 15-ton crawl-tread locomotive crane from McMyler-Interstate Co.

McClelland & Junkersfeld, engineers, 68 Trinity Place, New York, 100-ton, 63-ft. 6-in. span, 4-motor, overhead crane for Great Western Power Co., San Francisco,

Cal., reported from Shaw Electric Crane Co.

Summers Fertilizer Co., Baltimore, Md., 5-ton, 80-ft. span, 4-motor, bucket handling crane from mid-western builder.

Globe Seamless Tubes Co., Milwaukee, 15-ton, 105-ft. span electric traveling crane, from unnamed bidder.

Sargent & Lundy, engineers, Chicago, 20-ton power house crane from Whiting Corporation.

Williams, White & Co., Moline, Ill., a 15-ton and a 30-ton electric crane, from Alfred Box & Co.

Bigbie Grate & Forced Draft Equipment Corporation, 90 West Street, New York, has been formed to make grates, blowers and heating equipment parts. Company is at present under contract to Hay Foundry & Iron Works, Newark.

Behr-Manning Corporation, Troy, N. Y., recently formed by consolidation of Herman Behr & Co., Brooklyn, and Manning Abrasive Co., Troy, has started construction of several buildings at Troy which will house machinery to be moved from Brooklyn plant, which will be discontinued. New buildings include machine shop, storehouse, manufacturing building, grading building, and power plant, with coal pocket, side tracks, etc. New construction will double capacity of plant and is estimated to cost \$350,000. Morton C. Tuttle Co., Boston, is engineer and builder.

New England

BOSTON, Aug. 13.—The local machine tool trade has been more active the past week than in some time. The purchase of equipment by the city of Boston for its new Hyde Park district school is still under final adjustment, pending delivery dates and other matters, as stated before, purchases have been spread over a fairly large list of dealers, and it probably will be another week before full details are available.

In addition to this business, used tool dealers have closed on a comparatively good volume. One house sold 11 used presses, including one large and 10 small; another sold a set of rolls, a radial drill, several lathes and presses, and two single spindle drills, another sale included two fairly large lathes and a drill press. The 11 presses went to a Philadelphia dealer, but all other tools were taken by New England users.

George S. Wilber, 67 Redlands Road, West Roxbury district, Boston, is asking bids on a steel sand hopper at Newton, Mass.

E. P. Aldridge, 761 Dudley Street, Dorchester district, Boston, has completed plans for a one-story repair shop, 70 x 108 ft., for Frank Kerby, Summer Street, Natick, Mass.

Lynn Ornamental Iron Works, 966 Broad Street, Lynn, Mass., has awarded contract for a new shop. Sanborn & Weed, 38 Exchange Street, are architects.

Work has been started on a one-story plant, 42 x 70 ft., for Jewelers Cooperative Refining Co., Chestnut Street, North

Attleboro, Mass., to replace one recently destroyed by fire.

M. S. Little Mfg. Co., 151 New Park Avenue, Hartford, Conn., manufacturer of plumbing equipment and supplies, has asked bids on general contract for one-story addition, 50 x 120 ft., with L extension 10 x 50 ft., to be equipped as a brass foundry. W. W. Dolliver, Hartford, is architect.

L. & M. Standard Parts Co., Boston, has leased property at 72 Brookline Avenue for a new shop.

Terkelsen Machine Co., 326 A Street, Cambridge, Mass., has asked bids on general contract for two-story addition, to cost close to \$28,000 with equipment. F. E. Leland, 238 Main Street, is architect.

Olson Brothers, Camp Street, Plainville, Conn., manufacturers of screw machine products, have plans for a one-story addition, 26 x 85 ft.

Huntington Aircraft Corporation, Newfield Building, Bridgeport, Conn., has plans for new one-story plant, consisting of parts and assembling departments, to cost more than \$75,000 with machinery.

New England Fuel & Transportation Co., 201 River Street, Everett, Mass., will begin work on new coke screening and car-loading plant, to cost more than \$75,000 with equipment.

New England Flexible Door Corporation, Winsted, Conn., has been formed to manufacture metal and other doors. Company will be in market for materials and equipment specially constructed for sheet steel press and cut work.

Philadelphia

PHILADELPHIA, Aug. 13.—Conveying, machinery, refrigerating, power and other equipment will be installed in new three and four-story meat packing plant to be built by F. G. Vogt & Sons, Inc., Thirtieth and Race Streets, Philadelphia, to cost about \$165,000. C. B. Comstock, 110 West Fortieth Street, New York, is architect and engineer.

Frank M. Cohen, 516 Greenwich Street, Philadelphia, and associates have organized United Machines Corporation, to operate local factory for manufacture of cloth-cutting, pressing and kindred machinery and parts. It is proposed to begin production soon. Albert C. Cohen, 5323 North Mervine Street, will be an official.

Federal Container Co., Fifty-sixth Street and Paschall Avenue, Philadelphia, manufacturer of corrugated and fibreboard containers, recently acquired by

Fibre Board Products, Inc., San Francisco, and now operated as unit of that company, has engaged V. D. Simons, 435 North Michigan Avenue, Chicago, mill engineer, to prepare plans for new mill for paperboard and fibreboard production in vicinity of Philadelphia. Initial unit will have capacity of 150 tons per day, and is reported to cost in excess of \$650,000 with machinery.

Branch-Crawford Co., 1539 Wood Street, Philadelphia, manufacturer of pipe hangers, and other equipment, has awarded general contract to Harry Gill, Jr., 2515 Germantown Avenue, for one-story addition, to cost about \$25,000 with equipment. Ballinger Co., Twelfth and Chestnut Streets, is architect and engineer.

Philadelphia Steam Co., Philadelphia, care of Frank M. Hunter, Gibson Building, Chester, Pa., recently organized, has engaged Philip H. Johnson, Widener Building, architect, to prepare plans for central steam plant, to cost more than \$2,500,000 with underground piping system.

Board of City Commissioners, Atlantic City, N. J., will establish municipal airport at Bader Field, consisting of two hangars, repair and reconditioning shop, oil storage and distributing plant, to cost about \$75,000.

Leeds & Lippincott Co., Atlantic City, N. J., operating Chalfonte-Haddon Hall Hotel, has awarded general contract to Turner Construction Co., Graybar Building, New York, for new six-story automobile service, repair and garage building, and addition to power plant, to cost more than \$750,000.

American Ice Co., Broad and Cherry Streets, Philadelphia, will soon take bids for one-story and basement ice-manufacturing plant, 80 x 150 ft., to cost more than \$60,000 with equipment.

Harrisburg Gas Co., Harrisburg, Pa., has purchased property, 65 x 265 ft., as site for new equipment storage and distributing plant, with machine and repair division, to cost about \$180,000.

Hajoca Corporation, 1136 Ridge Avenue, Philadelphia, manufacturer of plumbing equipment and supplies, has awarded general contract to F. M. Harris & Co., 1520 Parrish Street, for one and two-story factory branch and distributing plant, 50 x 190 ft., at Hazleton, Pa., to include pipe shop and other mechanical departments, to cost in excess of \$50,000.

Public Service of Pennsylvania, Inc., Wilkes-Barre, Pa., operating electric light and power properties, is disposing of bond issue of \$500,000, a portion of proceeds to be used for extensions and improvements, including transmission line construction.

Traylor Engineering & Mfg. Co., Allentown, Pa., manufacturer of rock-crushing equipment, mining and other machinery, is arranging an expansion and improvement program for a new plant units and machinery to double, approximately, present capacity, reported to cost more than \$200,000. Samuel W. Traylor is president.

Pittsburgh

PITTSBURGH, Aug. 13.—Machine tool business is slow in this territory, partly due to the fact that many who direct purchases are away on vacations. Dealers have made prices on a considerable amount of business and expect increased sales when the vacation period ends.

Plans have been authorized by Craig Oil Co., Columbia Bank Building, Pittsburgh, R. T. Craig, president, for extensions and improvements in refinery, including new units and machinery to cost upward of \$400,000.

Board of Education, Fulton Building, Pittsburgh, is said to be planning installation of manual training equipment in addition to Baxter Junior High School, to cost about \$425,000. Kiehnel, Elliott & Chalfant, 515 Liberty Avenue, are architects.

Allegheny County Steam Heating Co., 435 Sixth Avenue, Pittsburgh, has begun work on new steam power plant for central heating service, to cost about \$660,000 with equipment.

Natural Gas Co. of West Virginia, Inc., Farmers' Bank Building, Pittsburgh, is concluding arrangements for purchase of plant and properties of Ohio Fuel & Gas Co., Alliance, Ohio, and vicinity, for \$895,000, and plans expansion and improvements, including pipe line construction. George W. Ratcliff is president.

Following acquisition of Kaestner & Hecht Co., 1500 North Branch Street, Chicago, manufacturer of electric elevators, by Westinghouse Electric & Mfg. Co., East Pittsburgh, Kaestner & Hecht name has been changed to Westinghouse Electric Elevator Co. It will be operated as separate unit.

South Atlantic

BALTIMORE, Aug. 13.—Contract has been let by Union Brothers, 37 West Cross Street, Baltimore, manufacturers of furniture, to J. L. Robinson Construction Co., 522 Park Avenue, for one-story addition, 50 x 300 ft., to cost more than \$100,000 with machinery. Benjamin Frank, 517 North Charles Street, is architect.

A. S. J. Atkinson, 3801 Macomb Street, N. W., Washington, architect, will soon take bids on general contract for five-story automobile service, repair and garage building, to cost about \$110,000 with equipment.

Starlighters Corporation, 735 Sansom Street, Philadelphia, Charles S. Bayer, Jr., president, recently organized, is planning construction and operation of airport in vicinity of Salisbury, Md., including hangars, repair and reconditioning shops, oil storage and distributing buildings, to cost in excess of \$80,000.

Tidewater Oil Co., 11 Broadway, New York, will soon begin construction on new oil storage and distributing plant at Baltimore, to cost close to \$500,000 with equipment.

Contract has been let by Industrial Rayon Co., Ninety-eighth Street and Walford Avenue, Cleveland, to Fiske-Carter Construction Co., Worcester, Mass., and Greenville, S. C., for new mill at Covington, Va., to include power house, machine shop and other units, entire project to cost in excess of \$1,000,000 with machinery.

Atlantic Gas Co., Lewis Building, Philadelphia, has authorized construction of artificial gas plant at Lexington, N. C., to cost upward of \$250,000, with 20 miles of piping system. Work will be carried out under supervision of Atlantic Construction & Engineering Co., an affiliated organization.

Standard Looms, Inc., East Spartanburg, S. C., has awarded general contract to Fiske-Carter Construction Co., Worcester, Mass., and Greenville, S. C., for plant to manufacture textile looms and other cotton mill machinery, consisting of one-story foundry, 180 x 350 ft.; one-story assembling plant, 140 x 380 ft.; and main operating unit, 180 x 350 ft. Entire project will cost about \$150,000 with equipment. Company was organized recently and has established offices at 519 East Main Street, Spartanburg; Isaac Andrews is president. Lockwood, Greene & Co., Charlotte, N. C., are architects and engineers.

International Harvester Co., Inc., 606 South Michigan Avenue, Chicago, has leased a building to be erected on South Elm Street, Greensboro, N. C., one-story 75 x 142 ft., for factory branch, service and repair building for motor truck division. General contract has been let to Walter Kidde & Co., Jefferson Standard Building, Greensboro.

George W. P. Overman, Norfolk, Va., is at head of project to operate a new plant for manufacture of a life-boat releasing gear. Initial works will be devoted to assembling and it is purposed to have malleable iron castings and other parts made at outside plants.

Twin City Boiler Works, Inc., Bristol, Va., is said to be planning purchase of a splitting shear, rotary type, to handle ¾-in. stock, and auxiliary equipment.

Detroit

DETROIT, Aug. 13.—Former factory of Michigan Furniture Co., Ann Arbor, Mich., has been acquired by Precision Products Co., same city, manufacturer of radio sets and equipment, for expansion. Property totals 40,000 sq. ft. of floor space.

Oldberg Mfg. Co., 2661 West Grand Boulevard, Detroit, manufacturer of automobile parts, is said to be planning one-story addition, to cost more than \$30,000 with equipment.

Chevrolet Motor Corporation, 3044 West Grand Boulevard, Detroit, has awarded general contract to Gervais F. Favrot, Balter Building, New Orleans, for one and two-story factory branch and distributing plant at Jefferson Davis Parkway and Venus Street, New Orleans, 122 x 250 ft., to cost in excess of \$125,000. Albert Kahn, Marquette Building, Detroit, is architect.

Detroit Casket Co., 2609 Hamilton Avenue, Detroit, will soon take bids on general contract for new one and two-story plant, with boiler house, to cost more than \$70,000 including equipment. Christian W. Brandt, 2111 Woodward Avenue, is architect.

Commercial Milling Co., 203 Randolph Street, Detroit, has awarded general contract to Foundation Co., Fulton Building,

Pittsburgh, for five-story addition to flour mill, to cost close to \$250,000 with equipment.

Briggs Commercial & Development Co., Detroit, has purchased former plant of Rickenbacker Motor Co., Cabot Avenue, and is interested in a company being organized under name of Verville Aircraft Co., to take over and occupy greater portion of plant for manufacture of commercial airplanes and parts.

Wilder-Strong Implement Co., Monroe, Mich., manufacturer of agricultural implements, etc., is said to have plans for one-story addition, to cost in excess of \$30,000 with equipment.

Fisher Body Corporation, Detroit, has asked bids on general contract for a one-story addition to automobile body works at Flint, Mich., to be used for pattern shop, die department, and other divisions, to cost about \$140,000. Company is said to have plans for another two-story addition at same location, to cost more than \$100,000. Albert Kahn, Marquette Building, Detroit, is architect.

Indiana

INDIANAPOLIS, Aug. 13.—Plans are being considered by John Deere Plow Co., 216 South Senate Street, Indianapolis, for new factory branch and distributing plant at Fort Wayne, to cost close to \$40,000 with equipment.

Central Indiana Gas Co., Anderson, plans expansion in artificial gas plant, including new holder, with capacity of about 200,000 cu. ft., to cost in excess of \$250,000.

Bishop, Knowlton & Carson, 312 North Meridian Street, Indianapolis, architects, have plans for three-story and basement baking plant at Louisville, for company whose name is temporarily withheld, to include ovens, power equipment, conveying and other machinery, to cost close to \$300,000.

Laurel Motors Corporation, Anderson, is arranging to specialize in production of airplane motors, and will arrange for parts manufacture and assembling.

Acme Works, Inc., 420 South Harding Street, Indianapolis, manufacturer of aluminum products, has awarded general contract to Robert Berner Co., 401 South Harding Street, for one-story addition, 80 x 136 ft., to cost close to \$25,000 with equipment.

Cleveland

CLEVELAND, Aug. 13.—Contract has been let by Ohio Crank Shaft Co., 6600 Clement Avenue, Cleveland, to J. L. Hunting Co., Guarantee Title Building, for one-story machine shop, 80 x 142 ft., to cost about \$70,000 with equipment.

Board of Education, Youngstown, has authorized remodeling and improving old Rayen high school for use as a technical and vocational high school, with installation of equipment. S. R. Creps, director, will be in charge and is making estimates of cost.

Dura Co., 1336 West Bancroft Street, Toledo, Ohio, manufacturer of automatic window regulators, etc., has awarded general contract to A. Bentley & Sons Co., Toledo, for new one-story plant, 260 x 500 ft., to cost more than \$175,000 with equipment.

Sun Radiator Cover, Inc., Cleveland, has leased portion of building at 7804 Carnegie Avenue, and will establish new plant for manufacture of radiator shields.

Ferro Enameling Co., B. F. Keith Building, Cleveland, metal and steel enameling, has awarded general contract to Kirschner Co., 2725 Pittsburgh Avenue, for two-story and basement addition, 54 x 68 ft., to cost close to \$35,000 with equipment.

City Council, Painesville, Ohio, plans early call for bids for equipment for addition to municipal electric light and power plant, to cost in excess of \$85,000.

Niles Steel Products Co., Niles, Ohio, is increasing its capital stock from \$200,000 to \$500,000 and enlarging its capacity one-third for production of steel containers. W. A. Thomas, former president Brier Hill Steel Co., is principal stockholder.

Truscon Steel Co. is centering its pressed steel department in Cleveland, where it purchased, at receiver's sale, plant of Hydraulic Pressed Steel Co. Part of Truscon company's pressed steel sales department has been transferred from Youngstown to Cleveland.

Federal Foundry Supply Co., Cleveland, is erecting new plant at 4600 East Seventy-first Street, Cleveland, part two stories, 90 x 180 ft., and office building, 24 x 120 ft. Machine shop will be 90 x 60 ft., stock room, 90 x 100 ft. and grinding room, 90 x 100 ft. Plant is expected to be in operation Oct. 1.

Transformer division of Packard Electric Co., Warren, Ohio, has been purchased by American Brown Boveri Electric Corporation, Camden, N. J., and manufacturing and engineering facilities will be consolidated with those of purchasing company at Camden. Transformers established under Packard trademark will be continued and coordinated with high-tension, large capacity transformers made by Brown Boveri company. N. A. Wolcott, president of Packard organization, will become associated with Camden company.

Buffalo

BUFFALO, Aug. 13.—Buffalo Tank Corporation, Buffalo, care of Ellis H. Gidley, Marine Trust Building, recently organized with capital of \$100,000, will operate local plant for manufacture of steel and galvanized tanks and kindred plate products.

Olean Tile Co., Olean, N. Y., has awarded general contract to A. A. Lane Construction Co., 1869 East Fifty-fifth Street, Cleveland, for three one-story additions, 100 x 105 ft., 50 x 360 ft., and 160 x 260 ft., to cost close to \$250,000 with machinery.

George F. Fisk, commissioner of public works, Municipal Building, Buffalo, is asking bids until Sept. 4 for construction of new buildings for New York State College for Teachers, Buffalo, including vocational school, as per plans and specifications on file.

Walter D. Webster, 61 Washington Avenue, and Willis D. Sweet, Jr., 3 Walling Avenue, Oneonta, N. Y., have organized Webster-Sweet, Inc., with capital of \$25,000, to operate a local plant for manufacture of engines and parts, and kindred equipment.

Consolidated Aircraft Corporation, Elmwood Avenue, Buffalo, has recently taken over additional buildings adjoining its plant and is carrying out an expansion program. A flying field, with hangar, repair and reconditioning shop and other units, is being established.

Ritter Dental Mfg. Co., Rochester, N. Y., has acquired Electro Dental Mfg. Co., Philadelphia, and will remove company to Rochester as soon as addition can be

erected. Extension will be two stories, 60 x 400 ft., and cost \$300,000. It is expected to be ready for occupancy Jan. 1. Edward L. Wayman is president and general manager of Ritter company.

Don F. Johnson & Co., Inc., 6 Terrace, Buffalo, has been formed to carry on wholesale hardware and mill supply business in Buffalo district, including Tonawanda, North Tonawanda, Niagara Falls, Lockport, Batavia and Jamestown. It will represent E. C. Atkins & Co., Inc., Indianapolis, hack saws, band saws and files; Buckeye Twist Drill Co., Alliance, Ohio, drills and reamers; Gardner Tap & Die Co., Marion, Ohio, taps and dies; Hisey-Wolf Machine Co., Cincinnati, electric drills, grinders and buffers, and Union Mfg. Co., New Britain, Conn., chucks and hoists. Don F. Johnson, recently president Duroflex Corporation, Buffalo, is president of new company.

Chicago

CHICAGO, Aug. 13.—Fresh inquiry for machine tools is in smaller volume and dealers are concentrating on prospective business which developed prior to this month. Small industrial buyers who want standard tools are fairly active, but in many cases are not satisfied with promises of delivery.

Railroad business is confined to miscellaneous inquiries. The Santa Fe will buy a spring banding press, and the Chicago, Milwaukee, St. Paul & Pacific will take prices on a frog and switch planer. The Burlington will purchase an 18-in. lathe, and the Rock Island is interested in a 48-in. radial drill. Quotations have been submitted on machine tools that will be purchased by A. O. Smith Corporation, Milwaukee.

Interstate Iron & Steel Co., 104 South Michigan Avenue, Chicago, will build a three-story transformer station, 50 x 83 ft., to cost \$18,000.

Cameron Can Machinery Co. 140 North Ashland Avenue, Chicago, will build an addition, 98 x 216 ft., to cost \$100,000.

Moline Iron Works, Moline, Ill., has been granted a permit to erect an addition.

Contract has been let by Emerson-Brantingham Co., South Independence Avenue, Rockford, Ill., manufacturer of agricultural implements to Security Building Co., 1016 Charles Street, for one-story addition, 120 x 215 ft., to cost close to \$100,000 with equipment.

Quaker Oats Co., 80 East Jackson Boulevard, Chicago, has awarded general contract to Leonard Construction Co., 37 South Wabash Avenue, for multi-story mill and distributing plant at Cedar Rapids, Iowa, 85 x 115 ft., to cost more than \$300,000 with equipment.

Chicago Printed String Co., 2411 Clybourn Avenue, Chicago, manufacturer of adhesive paper tape and kindred products, is having plans drawn for a two-story and basement plant, 85 x 125 ft., to cost about \$175,000 with equipment. Alfred S. Alschuler, 53 West Jackson Boulevard, is architect.

Standard Oil Co., 910 South Michigan Avenue, Chicago, has awarded general contract to Kaiser-Duett Co., Rialto Square Building, Joliet, Ill., for one and two-story storage and distributing plant, with boiler house and automobile service, repair and garage building at Joliet, to cost upward of \$100,000 with equipment.

Community Motors, Inc., 235 East Thirty-third Street, Chicago, has filed

plans for two-story service, repair and garage building, 130 x 175 ft., to cost in excess of \$250,000 with equipment.

Victor Mfg. & Gasket Co., 5750 Roosevelt Road, Chicago, manufacturer of gaskets and other power equipment, is completing plans for four-story addition, 100 x 160 ft., to cost \$150,000 with equipment. Frank D. Chase, Inc., 720 North Michigan Boulevard, is architect and engineer.

Gulf States

BIRMINGHAM, Aug. 13.—Bids will soon be asked by Texas-Louisiana Power Co., Fort Worth, Tex., for new steam-operated electric generating plant at Olney, Tex., to cost in excess of \$150,000 with transmission system.

Ovens, power equipment, conveying and other machinery will be installed in new two-story plant at East Dallas, Tex., to be erected by Baird Baking Co., Fort Worth, Tex., to cost about \$160,000 with equipment.

Wilson & Toomer Fertilizer Co., West Bay Street, Jacksonville, Fla., is planning one-story addition, 200 x 500 ft., to cost close to \$100,000 with machinery.

City Council, Oxford, Miss., is said to be planning early purchase of one 2-ton electric traveling crane for installation in municipal power plant, for which plans have been drawn by Frank P. Gates, Edwards Hotel Building, Jackson, Miss., architect.

Board of Education, Corpus Christi, Tex., plans installation of manual training equipment in new three-story high school to cost about \$275,000, for which superstructure will soon be placed under way. G. P. Blevins is secretary in charge.

C. A. Parker, 533 Vine Street, Shreveport, La., and associates have awarded general contract to H. C. Bellows, 208 Edwards Street, for new three-story automobile service, repair and garage building to cost approximately \$130,000, with equipment.

City Council, Amarillo, Tex., is planning fund of \$45,000 for establishment of municipal airport, including hangar, 80 x 100 ft., machine and repair shops and other buildings. It is understood that company to be known as Amarillo Airport Corporation will be organized to carry out project. J. D. Bartlett is city manager, in charge.

Florida Container Co., Tampa, Fla., care of John T. Ladue and T. M. Schackelford, 933 Golf View Avenue, recently organized, has acquired property on Mississippi Avenue and plans early establishment of new plant for manufacture of corrugated and fiberboard containers.

United States Bureau of Mines, Department of Commerce, Washington, has awarded contract to James T. Taylor, Fort Worth, Tex., for new helium gas plant at Stoncy, near Amarillo, Tex., to cost about \$500,000 with machinery.

Firestone Tire & Rubber Co., Akron, Ohio, has plans for new factory branch and distributing plant at Jacksonville, Fla., to cost more than \$300,000 with equipment.

Magnolia Petroleum Co., Dallas, Tex., has acquired tract of 600 acres adjoining storage and distributing plant at Midland, Tex., and plans early construction of additional units to cost more than \$250,000.

Lato Steel Mfg. Co., Texarkana, Ark.-Tex., has been incorporated to manufacture metal screens. It has purchased plant and patent rights of Delmar D. Pinkham and expects to develop this bus-

ness, adding other lines used in building operations and made from sheet metal. Later company expects to engage in fabrication of steel. J. K. Wadley is president of company.

Cincinnati

CINCINNATI, Aug. 13.—Although there has been a slight recession in machine tool buying since the first of the month, local builders are agreed that this is the best summer in several years, so far as bookings are concerned. Manufacturers are somewhat surprised at the level at which business has been sustained in the past 60 days, a level which is regarded as eminently satisfactory. Operations of Cincinnati machine tool plants are being carried along far above normal for the July-August period and no slackening of production is in sight. The large number of sources of current business is indicative of the widespread demand for new equipment among consuming industries.

American Car & Foundry Co. has bought a 48-in. car-wheel borer for installation at its Berwick, Pa., works, and A. S. Cameron Pump Works, Philipsburg, N. J., has purchased two 6-ft. right-line radial drills.

Bids will soon be asked on general contract by Ohio Valley Oxygen Co., 942 Kenyon Street, Cincinnati, manufacturer of industrial oxygen, etc., for one-story addition, to cost approximately \$35,000 with equipment. J. G. Steinkamp, Mercantile Library Building, is architect.

W. A. Cluff, chairman of board of trustees, State Normal College, Columbus, Ohio, is asking bids until Aug. 31 for extensions and improvements in power house at institution at Kent, Ohio, to cost approximately \$75,000, including new steam lines, tunnel, etc. Ronan & Engleson, 1694 North High Street, Columbus, are architects.

Ohio Fuel Gas Co., 99 North Front Street, Columbus, Ohio, has filed plans for two-story automobile service, repair and garage building, with equipment storage and distributing facilities, to cost about \$130,000 with equipment. E. C. Ramsey is in charge.

Federal Public Service Co., operating Crystal Ice & Cold Storage Co., Twenty-second Street and Central Avenue, Ashland, Ky., recently acquired, is reported planning new cold storage and refrigerating plant unit on adjoining site, to cost in excess of \$150,000 with machinery.

F. L. Saino Mfg. Co., 66 West Colorado Street, Memphis, Tenn., manufacturer of fire doors and other fireproof building products, is said to be planning an expansion and improvement program. Company recently arranged for increase in capital.

Springfield Metallic Casket Co., North Street, Springfield, Ohio, is said to be arranging early call for bids for addition to cost upward of \$175,000, for which plans are being drawn by Eastman & Budke, First National Bank Building, architect.

Aluminum Industries Corporation, 2416 Beekman Street, Cincinnati, has awarded general contract to H. C. Hazen, Cincinnati, for a one-story foundry, to cost close to \$20,000 with equipment.

Regan & Weller, Dermon Building, Memphis, Tenn., architects, have completed plans for new three-story boys' high school, with manual training facilities, to cost about \$260,000, for which superstructure will soon begin.

Milwaukee

MILWAUKEE, Aug. 13.—Machine-tool builders describe the situation as satisfactory, all things considered. Production is well sustained and some shops are on overtime schedules to keep deliveries within specifications. The bulk of business consists of single tools, with here and there a small lot order. The volume of inquiry received is taken to forecast favorable business. On the whole, this is the best summer season most tool builders have experienced in a number of years.

Wisconsin-Michigan Power Co., 112 East College Avenue, Appleton, Wis., has purchased 17,000 acres along both banks of the Sturgeon River, in Baraga County, Mich., and is undertaking a \$3,000,000 hydroelectric generating project covering three years. E. H. Schnidman is hydraulic engineer. D. K. Ellis, Appleton, is vice-president and general manager.

Hill-Hubbel Co., San Francisco, has leased former Kidwell Boiler Mfg. Co. plant at Thirty-second and Hopkins Streets, Milwaukee, for protective processing a welded steel pipe manufactured by A. O. Smith Corporation for a 350-mile pipe line for Texas Pipe Line Co. San Francisco company has developed an automatic system of covering pipe with asphalt and felt paper. Quarters in former Kidwell plant are only temporary, Hill-Hubbel Co. planning construction of a new shop in closer proximity to Smith plant. New plants also are to be established at Indiana Harbor, Ind., and Youngstown. Machinery for these branches is being built in Milwaukee shop. Herman Kramer is general superintendent.

Wisconsin Parts Co., 571 High Street, Oshkosh, Wis., manufacturer of axles and gears for heavy duty motor vehicles, is erecting two-story office building, 40 x 70 ft., and a one-story shop extension. Present office space will be converted into shop quarters. Tooling also will be materially increased.

Gunderman Motor Sales Co., 399 Fifty-first Avenue, West Allis, Milwaukee, is enlarging its service shop by an addition, 40 x 60 ft.

W. Clasmann Co., Milwaukee, has been incorporated to furnish sales and engineering service for industrial and mechanical equipment manufacturers. Headquarters are at 120 East Wisconsin Avenue. Principals are Fred W. and John W. Clasmann.

St. Louis

ST. LOUIS, Aug. 13.—Plans are being considered by Missouri Pacific Railroad Co., Missouri Pacific Building, St. Louis, for new car and locomotive repair shops at Nettleton, Mo., to cost in excess of \$100,000 with equipment. E. A. Hadley is chief engineer.

Pine Bluff Cotton Oil Mill, Pine Bluff, Ark., has arranged an expansion and improvement program to cost about \$50,000, including installation of two cotton oil presses and auxiliary equipment.

Cities Service Gas Co., Wichita, Kan., operated by Cities Service Co., 60 Wall Street, New York, has plans for new 16-in. pipe line for natural gas service from Ottawa and Kansas City, Kan. Company will also make extensions in gas compressor stations at Mooreland, Okla., and at points on Wichita-Pampa, Tex., line, and new 5000-hp. compressor units will be built at Corwin, Kan., and Higgins, Tex.

Tulsa Airport Corporation, Tulsa, Okla., has awarded general contract to B. Russell Shaw Co., 810 Olive Street, St. Louis, for complete airport, including hangars, machine and repair shops, oil storage and distributing building, control tower and other units.

Wetherell Motor Co., Twentieth and Harney Streets, Omaha, Neb., W. H. Wetherell, head, has leased new three-story and basement building, 146 x 200 ft., to be erected at Twentieth and Dodge Streets, for new service, repair and garage unit, to cost about \$160,000 with equipment. Harvey C. Peterson, Bankers Reserve Life Building, is architect.

Page Milk Co., Merrill, Wis., plans construction of power house and machine shop at new milk condensary at Marshall, Mo.; will also install can department, with conveying and other handling equipment. Entire project will cost in excess of \$200,000.

Oklahoma Steel Castings Co., Tulsa, Okla., has placed contract with Industrial Construction Co., Tulsa, for 50 x 50 ft. extension to finishing department and has purchased following equipment: Five-ton, overhead electric traveling crane from Shepard Electric Crane & Hoist Co.; 1-ton, gas fired, automatic temperature control annealing oven from Mahr Mfg. Co.; electric control mechanism from Brown Instrument Co., and rotary table sand blast room and complete dust arrester equipment, from Pangborn Corporation.

Sterling Machinery Corporation, 2307 Holmes Street, Kansas City, Mo., has been formed to manufacture electric and gasoline driven hoists. Contract for iron and semi-steel castings has been awarded to Kansas City Hay Press Foundry and machine work contract has been let to Schroer Brothers, Inc.

Pacific Coast

SAN FRANCISCO, Aug. 8.—Plans are being arranged by California Wire & Cable Co., Orange, Cal., for one-story addition, to cost close to \$80,000 with equipment.

Pacific Coast Pulp & Paper Co., Los Angeles, care of C. A. Kieren, Hotel Clunie, Sacramento, Cal., superintendent, recently organized, is taking bids on general contract for one, two and three-story mill at Richvale, Cal., with machine shop and miscellaneous units, to cost about \$900,000 with machinery. Peter Swan, Lewis Building, Portland, is engineer.

Morgan, Walls & Clements, Van Nuys Building, Los Angeles, architects, are completing plans for three-story and basement automobile service, repair and garage building, 60 x 150 ft., to cost in excess of \$120,000 with equipment.

Board of Education, Los Angeles, will soon begin work on one-story addition to manual training shop at David Starr Jordan High School, to cost about \$38,000. William A. Sheldon, Chamber of Commerce Building, secretary, in charge.

Coal Products Corporation, North Bend, Ore., is planning construction of one-story coal reducing, pulverizing and by-products plant on waterfront, 60 x 600 ft., to cost \$300,000 with equipment. Clyde M. Clefton is secretary.

Texas Oil Co., Yeon Building, Portland, has plans for oil storage and distributing plant on waterfront property, to cost in excess of \$350,000 with equipment. Entire project will include marine terminal facilities for oil handling and shipping,

and will cost upward of \$750,000. L. M. McCray is district manager.

Municipal Bureau of Supplies, San Francisco, is planning construction of storage and distributing plant, with repair department, to cost \$250,000 with conveying and other material-handling equipment.

California Sprayer Co., 6001 Pasadena Avenue, Los Angeles, manufacturer of spraying equipment, has plans for a two-story addition, 60 x 96 ft., to cost about \$20,000. Loy L. Smith, 1506 West Forty-sixth Street, is architect.

Canada

TORONTO, Aug. 13.—Demand for machine tools continues at a high level, and indications are that August business will equal that of any former month this year. While most of the business is for single tools, inquiry is coming out for complete equipment for industrial plants now under construction.

The Dominion Department of Railways and Canals, Ottawa, has awarded contract for operating machinery and electrical equipment for lock gates, taintor valves, regulating weirs and gateway for the Welland Canal to the Montreal Locomotive Works, Ltd., 145 St. James Street. Several other large contracts for equipment for new plants and electrical works, etc., have recently been closed and others are pending.

Canadian National Electric Railways, Toronto, have awarded contract to Bathe & McLelland, 17 Yonge Street, for construction of car house, sub-station, etc., at North Oshawa freight terminal to cost \$150,000.

Service Station Equipment Co., Ltd., 510 King Street East, Toronto, has awarded contract for new one-story factory, 100 x 400 ft. Machinery and tools will be purchased later.

Dominion Bridge Co., Redford Building, Toronto, has awarded contract to Dickie Construction Co., 17 Yorkville Avenue, for an addition to cost \$85,000.

General Metal Devices, Ltd., Oakville, Ont., has awarded contract to W. W. King for a factory to cost \$20,000. R. Card, 142 Chester Avenue, Toronto, is architect. Building will be one story, 60 x 300 ft.

Gilmour Chair, Ltd., Coaticook, Que., has awarded contract to Stewart Construction Co., Ltd., 12 Wellington Street North, Sherbrooke, Que., for a factory to cost \$80,000. It will be in three units each one story, 80 x 400 ft., 20 x 50 ft., and 56 x 109 ft. Ewart, Armer & Bryan, Jackson Building, Ottawa, are architects.

North Shore Power Co., Ltd., Des Forges Street, Three Rivers, Que., will build a \$50,000 addition to its plant.

F. A. Dallyn, 71 King Street West, Toronto, Ont., has plans for a filtration plant and power house in Queen Victoria Park, Dufferin Island, Niagara Falls, Ont., for Niagara Falls Water Commission, to cost \$500,000.

Sawmill owned by Hawkesbury Lumber Co., Hawkesbury, Ont., was destroyed by fire Aug. 9, with a loss estimated at \$200,000. Owner will rebuild immediately and will be in market for necessary equipment.

Foreign

PLANs have been approved by Eisen and Stahlwerke Aktiengesellschaft, Dortmund, Germany, manufacturer of iron and steel products, for an addition to be equipped in part as rolling mill for aluminum and other metals, and for metal plating. It is purposed to have the unit ready late in fall.

Colombian Ministry of Public Works, Bogota, Colombia, is asking bids until Sept. 10 for one 20-ton overhead electric traveling crane.

Electroplan of Soviet Russian Government, Moscow, has authorized plans for a steam-operated electric generating plant in Bobrikovsk district, Tula Province, about 140 miles from Moscow, to be developed as largest station of type in that country. Site is located in coal district and mining properties will be developed for fuel supply. Entire plant will have capacity of 300,000 kw. and is estimated to cost more than \$100,000,000. American-Russian Chamber of Commerce, 145 West Fifty-seventh Street, New York, has information on project.

State Electricity Commission of Victoria, Melbourne, Australia, will receive bids until Oct. 31 for watertube boilers and complete accessory equipment, as per plans and specifications on file, also available at office of Agent General for Victoria, Victoria House, Melbourne Place, Strand, London, England.

Minister of Interior, Asuncion, Paraguay, will ask tenders soon for a complete waterworks and sewage system for city, to cost about 4,560,000 Argentine gold pesos (about \$4,377,600), including power equipment, pumping machinery and other apparatus. Information at office of Bureau of Foreign and Domestic Commerce, Washington, reference Paraguay No. 283379.

Mexican Eagle Oil Co., Mexico City, Mexico, is planning extensions and improvements in refinery at Minatitlan to double the present capacity, including construction of pipe line from new oil fields recently developed on Isthmus of Tehuantepec, with compressor stations, etc., to furnish additional supply of crude oil to refinery. Entire project will cost close to 6,000,000 pesos (\$3,000,000).

New Trade Publications

Air Hammers.—Union Iron Works, Hoboken, N. J. Bulletin 104 of 8 pages illustrates and describes a line of hammers designed primarily for construction work and particularly for driving sheet and piles. Those for sheeting weigh 97 and 220 lb. in the two sizes here featured, while the pile-driving hammers run up to a maximum of 21,000 lb., striking a blow of 17,815 lb.

Coal Cleaning.—"Stabilization of the Coal Industry and the Sand Flotation Process," H. M. Chance & Co., 943 Drexel Building, Philadelphia. Describes the various principles of coal washing, including flotation of coal in a water-sand sludge. The latter process is said to be installed in 25 plants with combined annual capacity of 10,000,000 tons.

Carburizing Furnaces.—American Gas Furnace Co., Elizabeth, N. J. Bulletin 12-A, showing rotary retort carburizing machines and stationary vertical retorts, the latter using gas as the carburizing agent. Both types of furnaces can be used for other purposes, such as annealing, rehardening, nitrogen hardening, and bright annealing in hydrogen.

1928-1929 Calendar.—David Bell Co., Buffalo. Calendar from August, 1928, to July, 1929, inclusive, featuring illustration of the Liberty Bell and the first note struck on it.

Refractory Materials.—Bolckow, Vaughan & Co., Ltd., Middlesbrough, England. Booklet describing silica and fireclay refractory products. Analyses and various uses of different products are included together with illustrations of typical installations.

Solder.—J. Linn Johnson Mfg. Co., Wilkes-Barre, Pa. Leaflet dealing with solder for iron and steel castings, etc., which may be applied without soldering iron and hardens immediately.

Steel Windows.—Bogert & Carlough Co., Paterson, N. J. Catalog J-28, describing Boca projected steel windows with emphasis on bronze ventilator guide, which is special feature. Specifications, detail drawings and complete data for architect or engineer are included.

Building Products.—Milwaukee Corrugating Co., Milwaukee. Catalog 20-

E, being a data book on materials and methods on building products. Engineering tables on reinforced concrete construction are included, together with details, specifications and general information regarding expanded metal lath, expansion corner bead and casings, interior metal trim, steel domes, channels and other firesafe building products.

Bolt Clippers and Cutters.—H. K. Porter, Inc., Everett, Mass. Catalog containing detailed information and specifications of bolt clippers and wire, nut, chain, bench and special cutters. There are diagrams showing capacities of tools and jaw openings and nearly every kind of jaw made for bolt clipper handles is included.

Superheaters.—Superheater Co., 17 East Forty-second Street, New York. Catalog devoted to the Elesco superheater for power plants. Various phases of superheat are discussed and there are illustrations and explanations of many types of boilers so equipped.

Tool Steels.—Poldi Steel Corporation of America, New York. Leaflet devoted to the uses of the various specialized tool steels manufactured by Poldi Steel Works, Prague, Czechoslovakia. High speed, carbon, alloy and special steels are included.

Unit Heaters.—Skinner Brothers Mfg. Co., Inc., Elizabeth, N. J. Engineering data book giving details of unit heaters for various types of industrial buildings.

Baling Presses.—Logemann Brothers Co., Milwaukee. Leaflet describing Logemann toggle lever type baling and scrap metal presses with belt or direct motor drive.

Condulets.—Crouse-Hinds Co., Syracuse, N. Y. Bulletin 2112 dealing with condulets for railroad mail car lighting and fan installations. Full specifications and diagrams of lighting systems are included.

Resistance Thermometers.—Brown Instrument Co., Philadelphia. Catalog 93, containing detailed information about resistance thermometers for indicating, recording and controlling and for measuring temperatures from 300 to 1000 deg. Fahr. Full descriptions of applications to modern industrial uses are included.

THE IRON AGE

New York, August 23, 1928

ESTABLISHED 1855

VOL. 122, No. 8

Castings Without Green-Sand Molds

Dry-Sand Cores in Iron Box
Give Cylinder Blocks Close
to Required Dimensions—
Continuous Pour on
Conveyors

MOLDS for the Cylinder Blocks of the Dodge Victory and Standard Six Cars Are Made Entirely of Dry-Sand Cores. The rectangular wedge-shaped box takes the place of the flask. The men are setting in the last core which closes the mold

GREEN sand molds have been entirely eliminated in the manufacture of automobile cylinder block castings by Dodge Brothers, Inc., Detroit. The mold is now made entirely of dry sand cores. This interesting development in foundry methods is a step in the evolution of molding practices. It is said to result in a marked saving in labor and in floor space and in the production of castings which are better than those made by the former practices, in that they are more uniform in dimensions, in metal thickness and in weight. The mold, it is stated, is held within closer limits because the dry sand core has less tendency to give than a green sand mold. Heretofore for several years the Dodge foundry has been making only the drag half of the mold in green sand, using a one-piece flask and bottom board.

The mold is now made in a rectangular wedge-shaped box, which has superseded the one-piece flask and bottom board. This box is machined on the inside within 0.002-in. limits. The cores are so made that they fit into one another. Before they are assembled in the box they are inspected and gaged. The mold is built up upside down, as it is carried along on a conveyor.

First the water jacket core is placed on the bottom of the box. On top and around this is placed the water jacket block core, which forms the outside of the water jacket in the casting. On top of this a valve spring housing core is placed. Then come two side cores which form the outside of the crank case and a portion of the barrels. Next, the barrel core is put in the center of the water jacket, between the cylinder block core and valve spring core. This forms the inside of the barrel wall. The crank case core is placed between two side cores and two end cores, which form the gear housing or front end of the crank case and the fly-wheel mounting or rear end of the crank case, and over the cylinder barrel cores. The joint around this core is mudded to prevent iron from running out through the seam.

Clamps are then placed on top of the boxes and two runner boards are put on. The molds are then poured with two 100-lb. hand ladles, which are filled from a 2000-lb. bull ladle.

The cores are made in core machines and baked in continuous ovens, usual methods being followed in their manufacture. A whitewash coating is applied to the cores. This is used in place of a black coating, because of its high heat-

TRANSFERRING
the Mold from the
Pouring Conveyor
(Above) to the Cool-
ing Conveyor

AN Overhead Chain
Conveyor (at
Right) Lifts the Cast-
ings from the Cooling
Conveyor at Its Un-
loading End. Here any
cores that may be
sticking to it are re-
moved, this being the
first step in cleaning
the castings

conveyor it is hooked off by means of an overhead chain conveyor and is cleaned of any cores which may be sticking to the casting. The castings are then placed on the floor, where they cool at room temperature. When they go to the cleaning room the core wires are removed and they are sand blasted, chipped and ground. They are then water tested to 100 lb. pressure.

The cylinder molding unit occupies a space 30 ft. x 165 ft. In this there are three conveyors, the molding conveyor, a return box conveyor and the shakeout and cooling conveyors. The unit has a capacity of 1800 cylinder block castings in 18 hr., and it has established a record of 1600 castings in 16 hr. with two shifts.

resisting qualities, because it is cleaner to work with and for the reason that white cores reflect the light and make the core room a brighter, cleaner-looking room. Cores on completion pass down an inclined belt conveyor from the core room to the foundry floor, and over another belt conveyor to the cylinder line. The inside of the molding box is oiled to prevent the cores from sticking. This is sprayed on before the making of each mold. Gas which arises during the pouring is carried away through vents in the bottom of the molding box, that index with holes in the water-jacket core.

Passing the end of the mold conveyor after pouring, the molding box, which is provided with trunnions at the two ends, is picked up by an electric traveling crane. It is turned over on its trunnions and the casting and cores fall out on an apron-type cooling conveyor 10 ft. wide and 165 ft. long. The casting remains on this conveyor 90 min. to allow it to normalize. At the unloading end of the apron

With the old methods and without conveyor equipment 300 cylinder blocks were produced in 9 hr. in a foundry floor space of approximately 60 x 350 ft. There is also a reduction in the space required for sand handling, molding machines and supplies.

The number of cores required depends on the design of the cylinder block and number of cylinders. A 6-cylinder block is being made with 338 lb. of core sand, or 87 lb. more than would be used in making the same casting in a green sand mold, but offsetting this is the elimination of the use of molding sand.

There is a saving in labor, it is stated, of 21 men, in making 1000 cylinder blocks a shift, as compared with the old method of using one-piece flasks and green sand molds.

Traveling over the apron-type conveyor shown above, the castings are not under a hood and the muffle effect which might thereby be obtained is not experienced. This is in contrast with the practice in certain foundries, both

COMPLETED Dry Sand Cores (at Right) Move Down the Inclined Belt Conveyor to the Foundry Floor and on to Another Belt Conveyor to the Cylinder Line, Where They Are Assembled in the Molding Box While the Latter Is Moving on a Conveyor

CHECKING the Accuracy of a Cylinder Core by Means of Jigs (Left). This is a most important part of the procedure, if the casting is to maintain the close limits of accuracy now demanded—in metal thickness, total weight and uniformity of dimensions

in the automotive field and elsewhere, of providing hoods for carrying away fumes and heated air. Where these cooling conveyors are provided with exhaust fans the cool-

ing of the castings proceeds, of course, at an accelerated pace. Frequently, in such cases, the product emerges at the other end in condition to be handled at once.

Sea-Water Corrosion of Steels

FIRST results are now available of the extended study of sea-water corrosion sponsored by the British Institution of Civil Engineers. Exposures of iron and steel are being made at Auckland, New Zealand; Halifax, Nova Scotia; Colombo, Ceylon, and Plymouth, England, on three groups, intended to be continued during five, ten and 15 years respectively. The five-year groups included not only single metals, but also pairs of dissimilar metals in contact with each other, the object being to throw light on the tendency in such pairs for one metal to be preserved at the expense of the other.

The first five years having fully expired, the samples from each port have been removed and examined by Dr. J. N. Friend. In each harbor each group of samples was divided into three sets, respectively fixed in the air above the water, at half-tide level, and totally submerged.

It is found that the five-year results from the various

ports show very satisfactory agreement with each other. Among other observations it is found that there is no great difference between the extent of corrosion of mild steel and of wrought iron, although in pairs of the two metals in contact the wrought iron corrodes more quickly, while the steel is partially preserved. Sulphur in steel appears to reduce its resistance to sea-water corrosion, and copper up to 2 per cent to increase it. Chromium steels and nickel steels, though very resistant to sea air and at half-tide level, are less so when totally submerged, and are also liable to severe pitting.

In resistance to corrosion as measured by loss of weight and pitting combined, the cast irons give the best results, but in some instances seem to show internal corrosion. The protection afforded to nickel or chromium steel by contact with mild steel at the expense of the latter is very marked.

Public Docks Encourage Water Shipments to Chicago

CHICAGO is now served by three public docks equipped to handle iron and steel. These are operated by the Terminals & Transportation Corporation of Illinois at 103d Street and the Calumet River, South Chicago, Ill.; the East Chicago Dock Terminal Co., Indiana Harbor, Ind., and the South Chicago Coal & Dock Co., South Chicago, Ill.

Chain of Water Terminals on Lakes

The first unit of the Terminals & Transportation Corporation, a terminal and warehouse at Duluth, Minn., was put in operation in 1923. Since that time similar facilities have been provided at Port Huron, Mich., Buffalo, Detroit and Chicago. In addition to these dock warehouses, the company has two transportation lines, the Minnesota-Atlantic Transit Co. and the Detroit-New York Transit Co. The Detroit-New York Transit Co. operates Diesel-electric motorships between Detroit and New York on regular schedules. The running time between the two cities is less than six days. The Minnesota-Atlantic Transit Co. operates steel steamers between Duluth and Buffalo, with stops at intermediate ports.

The Terminals & Transportation Corporation will finance goods in storage, making loans based on market value. Briefly, the whole service comprises:

1. Unloading of merchandise from railroad cars to boats.
2. Classification and storage.
3. Freezing, bonding and other special services.
4. Delivery to railroad, boat, express company or truck.
5. Transportation over Lake and canal line between Duluth, Chicago, Milwaukee, Port Huron, Detroit, Buffalo and New York.
6. Financial cooperation.

The McDougall terminal of the Terminals & Transportation

The illustration at the top of the page shows a cargo of structural steel being unloaded at the dock of the East Chicago Dock & Terminal Co., Indiana Harbor, Ind. The steel was shipped from a Lake Erie port.

tion Corporation at Duluth has 1500 ft. of dock, with two 3-ton electric cranes for handling heavy freight. The track capacity is 70 railroad cars. The terminal buildings are 128 ft. wide and several hundred feet in length, containing 350,000 sq. ft. of general storage space and 1,000,000 cu. ft. for cold storage. The main structure is six stories high.

At Detroit there are 1300 ft. of dock, handling bulk and package freight, the track capacity being 150 cars. The terminal building is 160 x 500 ft., 10 stories in height, and contains 800,000 sq. ft. of floor space. There are 2,500,000 cu. ft. of cold storage space and 5,000,000 cu. ft. for general storage. The tracks inside the building accommodate 25 cars.

At Buffalo, the Eastern terminus of heavy ship tonnage on the Great Lakes and the Western terminus of the New York State Barge Canal, the company has 1580 ft. of dock and a track capacity of 100 cars. The warehouse, 1050 ft. in length, provides 2,000,000 cu. ft. of general merchandise storage space and 2,000,000 cu. ft. for cold storage.

The terminal at Chicago includes a dock 1440 ft. long, which is equipped with two 30-ton locomotive cranes. The track capacity is 100 railroad cars. The steel storage warehouse is 80 x 600 ft.

Dock and warehouse facilities at Chicago were completed near the end of 1927, and therefore comparative figures of iron and steel shipments are not available. The company, at least at Chicago, is in the early stages of developing business. The terminal at Chicago is not equipped to handle coal or ore, but it has facilities for handling pig iron and iron and steel products.

The East Chicago Dock Terminal Co., a newly formed corporation, a subsidiary of the Interstate Terminal Warehouses, Inc., which owns and operates the North Pier Terminal at the mouth of the Chicago River, purchased in November, 1927, approximately 20 acres of ground on the

southeast bank of the Indiana Harbor Ship Canal, between Canal Street and the fork, having 1500 feet of dock frontage.

It also has a three-year option on approximately 77 acres of adjoining property, giving an additional 1700 ft. of dockage. This will give a total of 97 acres of open storage, but the company contemplates building sheds as soon as demand warrants. The property is located at the entrance of the Calumet River, which is a part of the Illinois waterways system, connecting with the Mississippi River. This dock is served by the Indiana Harbor Belt, the Baltimore & Ohio Chicago Terminal, the Elgin, Joliet & Eastern and the Pennsylvania railroads. The dock is laid out with four tracks running parallel to the water's edge, having a capacity of between 80 and 100 cars on the dock and from 40 to 50 additional cars on the lead-in track.

The dock is equipped with two 15-ton locomotive cranes, each having 55-ft. booms. There are also two 20-ton gantry cranes with 70-ft. spans. Ore-handling capacity is 4000 tons per day. Pig iron can be handled at the rate of 150 tons per hour by means of 55-in. and 65-in. magnets. Clam-shell buckets are provided in 1½ and 2½-cu. yd. capacities. Structural steel sections have been handled in lengths up to 90 ft.

This company, as previously stated, controls the North Pier Terminal at the mouth of the Chicago River, where 1,500,000 sq. ft. of storage space is available. It also operates warehouses at Cleveland and Indianapolis.

This year there have been received at this dock between 25 and 30 boats. Several have carried cargoes directly from European ports. Others have moved from the Atlantic Coast, Canadian ports, Buffalo, Cleveland and Detroit, with commodities destined not only to Chicago, but to points beyond, such as Denver, Kansas City, St. Louis and Milwaukee. There have also been a number of boats loaded for out-bound movement from Chicago to both American and Canadian ports on the Great Lakes.

The dock of the South Chicago Coal & Dock Co., South Chicago, Ill., is used to unload ore for rail shipment to Granite City, Ill. Four hundred thousand tons of ore passed over this dock in 1927, and an equal tonnage will be handled

before the close of navigation in 1928. The shipping charge on ore loaded at Escanaba, Mich., for delivery at Chicago is 47c. a gross ton and from Superior, Wis., to Chicago, 70c. a gross ton. The rail rate on ore from Chicago to Granite City is \$1.20 a ton. The South Chicago dock charges 21c. a gross ton for unloading and putting the ore on cars. This dock is 700 ft. in length. It is equipped with a gantry crane which will unload free running ore at the rate of 350 tons an hour. Consideration is now being given to the installation of a second crane equipped to handle structural material. Open air facilities are available for storage of ore, pig iron and structural material. The storage charge on pig iron varies from 5c. to 10c. a gross ton per month.

Sharp Gain in Water Shipments of Steel

Lake shipments of structural shapes to Chicago thus far in 1928 have averaged about 3000 tons a week. Up to Aug. 1 fully 20,000 tons of bars had been brought to Chicago by boat, and an equal tonnage is expected to be unloaded during August alone. In 1927 the Lake movement of structural shapes to Chicago was practically nil and the tonnage of bars shipped was negligible.

Boat shipments of pig iron from Lake Erie ports to Chicago totaled about 30,000 tons in 1927. The movement this year, up to Aug. 1, aggregated about 25,000 tons. The shipping season for pig iron in 1928 opened much earlier than in 1927, but, because of recent reductions in prices by Chicago furnaces, there is less incentive for Chicago brokers to bring in cargoes of pig iron than there was a year ago at this time. It is understood, however, that several vessels are still under contract and will handle cargoes to Chicago regardless of the existing relation between furnace prices of pig iron at Chicago and Lake Erie ports.

A boatload of low phosphorus pig iron has been shipped to Chicago directly from England in this season of navigation, and negotiations for a second shipment are now under way. It is also planned to arrange for direct boat shipments of ferromanganese from England and of spiegeleisen from Germany to Chicago.

The low phosphorus pig iron shipped from England was delivered to a Chicago dock for somewhat less than \$5.50 a

gross ton. A rate of \$5.50 a gross ton now being quoted on a proposed shipment from England to Chicago includes stops at two ports. Ferromanganese can also be handled at this rate. The vessels that will be available for these voyages across the ocean are said to be boats now being

built in Europe for Canadian service on the Great Lakes.

The Lake rate on pig iron from Cleveland to Chicago ranges from \$1.25 to \$1.50 a ton. Structural material can be moved from either Buffalo or Cleveland to Chicago at \$1 to \$1.25 a ton.

Performance Records of Stainless Steel

British Firms Find It Preferable for Pistons for Hydraulic Pumps, Blades for Steam Turbines, and Gas Engine Valves

BY N. F. BUDGEN, PH.D.*

CUTLERY is the most natural application of stainless steel. Its use enables large dining rooms to abolish the cleaning machines, to save work and reduce the wear of the blades. Surgical and dental instruments which must be protected against sterilizing agents are now usually made of stainless steel rather than of silver plated carbon steel. At Sheffield alone 750 tons of this metal is produced annually for cutlery manufacture.

There are three important further applications in mechanical construction which deserve special mention; namely, pistons for pumps or hydraulic presses, turbine blades and valves for internal combustion engines.

Pump Liners Resist Erosion

Davy Brothers, Ltd., Sheffield, England, built in 1915 a three cylinder pump, electric driven, for a pressure of 10,000 lb. per sq. in. One of the pistons was made of stainless steel, the other two of the more usual phosphor bronze.

This pump worked day and night until the end of the war. On inspection the diameter of the stainless steel piston was found to be reduced only 0.4 mm. in diameter, while the other two pistons were 2.8 mm. smaller. This reduction in wear evidently favors the conservation of power and the satisfactory working of the pump.

Tests on Steam Turbine Blades

Thomas Firth & Sons, Ltd., Sheffield, manufacturers of stainless steel, possess a Westinghouse steam turbine working at 3000 r.p.m., and receiving steam at 170 lb. per sq. in. superheated at 315 deg. C. It works uninterruptedly under a load factor varying from 25 to 100 per cent. The original blades were made of 5 per cent nickel steel. In June, 1920, some of these blades were replaced by others made of stainless steel and a few replacements were made in nickel steel.

The following table gives the characteristics of the two metals.

	Stainless Steel	Nickel Steel
Composition	0.30 per cent carbon 13.4 per cent chromium	0.19 per cent carbon 4.7 per cent nickel
Tensile strength ..	122,000 lb. per sq. in.	78,000 lb. per sq. in.
Elastic limit.....	99,000 lb. per sq. in.	54,000 lb. per sq. in.
Elongation	20 per cent	32 per cent
Brinell hardness ..	255	143

As mentioned before, in June, 1920, 24 blades were replaced in the high pressure wheel. On the one side of this wheel which functions in dry steam at a high temperature, 12 non-polished stainless steel blades were placed; on the opposite side six of the same metal, with three made of polished stainless steel and three of new nickel steel.

In the last wheel 12 blades were also replaced. On the one side of this wheel, which works in damp steam, three non-polished stainless steel blades were fitted and three in nickel steel, while on the opposite side three polished stainless steel and three nickel steel blades were fitted.

The turbine thus altered worked uninterruptedly for

3471 hr.; it was then taken down and while the nickel steel blades revealed the usual corrosion, the stainless steel ones were intact and had preserved all their original polish.

Results of these trials have been confirmed by those obtained by the Thomson-Houston company on one of its own turbines. At the beginning of 1916, this firm installed blades of a trial composition in the middle wheel of a turbine, but the wheel began to show corrosion very soon. Two hardened stainless steel blades were then fitted into this wheel, two of the same material hardened and tempered, two of phosphor bronze, two of nickel bronze, two of ordinary soft steel and two brass ones. This turbine was started in the autumn of 1916 and was not examined until April, 1918. With the exception of those made of stainless steel all the blades suffered slight erosion. Brass blades were especially worn. The extremities of the blades made of soft steel had become slightly uneven, while the nickel bronze ones had resisted as well as those made of stainless steel.

The turbine then operated until July, 1921, when it was found that the stainless steel blades were absolutely untouched on the edges. The inlet edges of the nickel bronze blades as well as the phosphor bronze ones had become uneven; those of soft steel were heavily corroded, the wear being about 1½ mm.

Such records show the advantage of stainless steel for the construction of turbines. The outline of the blades has great influence upon the performance; variations at the edges impart shocks and eddies, and reduce the efficiency. Non-corrosive blades reduce the necessary repairs and stoppages for cleaning and replacement.

Air Engine Valves Require Strength at Heat

Lastly may be mentioned the application of stainless steel for valves for internal combustion engines, especially those for aero engines and for the high-speed engines now so popular for motor cars. Noncorrosive valves and seats lengthen the time between regrindings and maintain unimpaired efficiency during operation.

What has really made the use of stainless steel for valves a success in aero engines is the security it gives during working because of the high strength at elevated temperatures. For such purposes the Derihon plant in Manchester supplied the Allies during the war 15,000 stainless steel airplane engine valves per week.

The automobile industry is leaning more and more toward the building of high output engines and to obtain this many English makers have fitted overhead valves. This arrangement has the serious disadvantages that a broken valve may fall into the compression chamber and break the piston and even the cylinder. Valve regrinding is also a lengthy and expensive operation on such an engine. Certain British firms using stainless steel valves guarantee 20,000 miles before it is necessary to regrind. Also the strength residing in this steel at high temperature permits the use of stronger springs and short valve stems.

*Metallurgical engineer, Birmingham, England.

Making Electric Manganese Steel

Details of Modern Practice for Ingots—Less Loss of Manganese—What Advantages Are Claimed Over Open-Hearth Method

BY J. H. HRUSKA*

IN the history of the metallurgical development of manganese steel, the general application of electric melting methods has resulted in an important improvement in the chemical as well as physical properties of this material.

Originally, the alloy steel manufacturers were strongly in favor of the generally used method of mixing low-carbon

Although many other specifications of the chemistry of high-manganese steels were introduced by the metal trade, most of the quality products of steel works producing this grade of steel may be ranged within these limits.

In order to avoid a rather tedious description of the metallurgical processes during the manufacture of high-grade manganese steel, a complete outline of a very satis-

Fig. 1. (At Left)—Relationship Between Carbon and Manganese as Originally Observed and Determined by Guillet

steel with molten ferromanganese or else to risk a large percentage of the added manganese and melt both together. In either case great losses had to be expected. With the use of electrometallurgical melting and refining not only have these losses been eliminated, but a high-grade material has been obtained.

Of course, the melting and refining operations connected with the manufacture of electric manganese steel were higher in cost as compared with the older methods and it was for this fundamental reason that it took some pioneering to put electric manganese steel as a commercial product on the market.

Preparation of the Molten Metal

In the successful manufacture of manganese steel of the so-called austenitic type, the important relationship between carbon and manganese—as originally observed and determined by Léon Guillet (Fig. 1)—and partly also between carbon, manganese and silicon has steadily to be held in mind. Thus a certain standard analysis or rather minimum content of the various constituents resulted more or less automatically. This generally accepted "specification" reads as follows:

	Per Cent
Carbon	less than 1.10
Manganese	11.50–13.50
Silicon	less than 0.60
Phosphorus	less than 0.065
Sulphur	less than 0.020

Fig. 2.—Heat Distribution Per Ton of Electric Manganese Steel

factory heat, made recently in a 7-ton basic Heroult furnace, is presented:

Charge used in making the heat:	Lb.
Carbon steel turnings.....	5,300
Carbon steel scrap.....	6,800
Initial metallic charge.....	12,100
Lime	160

Record of the heat:

Time	Operation	Length of Operation
9.47	Charging started.	
10.10	Current on.	
12.05	75 lb. scale added.	
12.37	102 lb. lime added.	
12.51	No. 1 samples of steel and slag taken.	
1.00	Furnace tilted in order to skim off the greatest part of oxidizing slag.	Charging, 23 min.
1.04	Current off and remainder of slag cleaned off the surface of the bath. Particular care taken in carrying out this operation.	Melting, 2 hr. 50 min.
1.07	Slagging finished; current on again.	Slagging, 7 min.
	After slagging, successively added:	
	45 lb. lime	
	10 lb. fluorspar	
	770 lb. ferrosilicomanganese	
1.22	75 lb. of lime added.	
1.28	Four shovels of powdered ferrosilicon thrown over slag mixture.	
1.34	No. 2 samples taken, after a thorough stirring of the bath.	

*Metallurgical engineer, 2328 South Euclid Avenue, Berwyn, Ill.

- 1.37—Four shovels of powdered ferrosilicon thrown on slag surface.
- 1.40—30 lb. of lime added.
- 1.52—Four shovels of powdered ferrosilicon thrown on slag surface.
- 2.00—Samples No. 3 taken after the bath was thoroughly stirred.
- 2.03—1100 lb. of ferromanganese added and 30 lb. of lime added.
- 2.24—780 lb. of ferromanganese added.
- 2.33—Samples No. 4 taken.
- 2.35—30 lb. lime added, then three shovels of powdered coke thrown on slag. Bath stirred, and left quiet for the rest of the heat.
- 2.58—Samples No. 5 taken.
- 3.21—Current off. A few large pieces of lime thrown near taphole to "thicken" the slag.
- 3.22—First steel tapped into hot ladle (bottom pour ladle).
- 3.24—Ladle filled.
- 3.27—Teeming started.
- 3.35—Sample of steel (No. 6) taken.
- 3.49—Teeming finished. No skull in ladle or furnace.

Analyses of steel samples:

Sample	1	2	3	4	5	6
Carbon	0.04	0.18	0.21	1.04	1.00	1.01
Manganese	0.38	4.18	4.37	13.93	13.31	12.89
Silicon	0.01	0.31	0.26	0.29	0.23	0.22
Phosphorus	0.003	0.032	0.035	0.049	0.052	0.047
Sulphur	0.018	0.027	0.018	0.013	0.010	0.006

Analyses of slag samples:

Sample	1	2	3	4	5
	Dark Greenish Brown	Green Gray	All Samples Light Greenish Gray, Crumbling to White Powder		
Appearance					
Silica	8.92	23.11	24.83	24.42	25.53
Ferrous Oxide....	24.62	7.63	4.60	2.29	1.86
Manganous Oxide.	23.41	14.06	7.29	3.66	3.21
Calcium Oxide....	32.56	42.10	51.84	57.12	56.97

Finishings:

Ferrosilicomanganese (63.84 per cent Mn).....	770
Ferromanganese (78.41 per cent Mn).....	1880

Slags:

Lime (87.22 per cent CaO, 0.59 per cent MgO, 0.91 per cent SiO ₂ , 0.064 per cent S).....	262
	reducing slag 210
	462
Fluorspar (84.26 per cent CaF ₂).....furnace	10
	ladle 10
	20
Ferrosilicon, powdered.....	approximately 35
Coke dust.....	approximately 15

Thermal efficiency of furnace:

According to a scheme, outlined in one of the author's previous articles (THE IRON AGE, Dec. 31, 1925, page 1845), a similar

balance sheet was worked out for the heat mentioned in the preceding paragraphs with the following results (calculated per 1 ton of finished manganese steel, Fig. 2):

	Per Cent
Steel	48.8
Slags	8.2
Cooling rings.....	2.9
Transformer	1.3
Radiation, etc.....	38.8
	100.00

Ingot Practice

Austenitic manganese steels are mostly teemed into rather small square ingots, the weight of each ingot rarely exceeding five tons. Many quality steel works, here and abroad, use bottom pouring, which method, in this case particularly, has the advantage of a quicker teeming and consequently more uniform pouring conditions as well as a better yield of sound metal.

After teeming, the molds should be stripped off the ingots as soon as possible. Obviously, "stickers" must be attended to immediately and, if stripping is impossible, the mold must be broken. The ingots should be delivered to the soaking pits at a very high initial temperature and arrangements should be made to maintain at the time of charging approximately the same temperatures in the pits as those of the charged ingots.

Conclusions

Comparing the manufacture of ingots of austenitic manganese steel made in basic electric and open-hearth furnaces, the following points are mainly to be considered:

Advantages

- 1.—Homogeneous metal.
- 2.—Practically negligible losses of manganese.
- 3.—Very little non-metallic and gaseous inclusions.
- 4.—Possibility of a hotter steel.

Disadvantages

- 1.—Very often the steel is finished and tapped too hot, which fact causes the usual higher shrinkage of electric steel as compared with the product of open-hearth furnaces:
Open-hearth ... 2.1 to 2.5 per cent
Electric 2.7 to 3.0 per cent
- 2.—When using tilting ladles slag interferes very often, thus bottom pour ladles should be considered as standard practice.
- 3.—Mostly higher production costs.

Safety Hints for Lacquering

THE Hartford Accident & Indemnity Co., Hartford, Conn., has issued for free circulation a second edition of an attractive pamphlet entitled "Spray Coating—its Hazards and Safeguards." It gives a brief but clear account of the constitution of modern lacquers and the various precautions which are necessary to avoid injuring the health of employees or endangering the plant. Practical suggestions are made on approved methods of designing the spray-booth and the ventilating system, and simple but effective and cleanly housekeeping methods are suggested. The booklet should be a source of useful information to operators who do a relatively small amount of finishing by this new process.

The following safety hints are given on a sheet, suitable for framing and posting, which will be sent by the company to those who ask it:

1. Do not use lacquers containing poisonous substances such as methyl alcohol, benzol, or tetrachlormethane.
2. Provide adequate exhaust ventilation before beginning spraying operations.
3. Arrange ventilating equipment so that fumes will not pass through fan.
4. Respirators and masks should not be depended upon to combat fume hazard unless they are equipped with tube leading to fresh air supply.
5. Employ a gun pressure that does not produce an excessive amount of mist.
6. Workers using lacquers containing lead and silica should be periodically examined by a physician.
7. Separate booths should be provided for each spraying operation.
8. Lacquers should be stored in fire-resistive structures, well ventilated and lighted with vapor-proof globes.

9. Main supplies of lacquer should not be stored in the factory proper.
10. Solvents and diluents should not be stored in the factory proper.
11. Use only incandescent vapor-proof globes for lighting.
12. Guard in an approved manner all switches and plugs.
13. Motors and flames should be safely isolated from spraying rooms.
14. Ground all electrical connections and make sure that thinner containers are grounded on metal supports—thus guarding against static electricity.
15. Iron or sparking metals should not be used for cleaning and scraping.
16. Steel lacquer drums should not be used for pressure containers.
17. Lacquers should not be mixed in the spraying room.
18. Air compressors should not be located in the spraying room.
19. Fire protection apparatus, extinguishers, sprinkler systems, etc., should be provided.
20. Keep equipment and factory clean—organize a strict, systematic cleaning schedule.

The part played by the foreman in the control of labor turnover is the third booklet of a series on the subject of labor turnover which has been issued by the Policyholders Service Bureau of the Metropolitan Life Insurance Co., New York. The foreman, it is pointed out, "can help employees to become adjusted to their work quickly, he can develop loyalty and he should be the first to learn of problems and difficulties which confront every wage earner." A composite of the views of 40 manufacturing concerns is contained in the booklet.

How Ford Makes Front Axles

Methods of Forging and Forming, Including Bending and Stretching Operations for the Model-A Car

BY FAY LEONE FAUROT*

FORGING and forming of the Ford Model-A front axle parts are interesting processes. Especially interesting is the manner in which the left-hand spindle arm is forged and shaped and the means used to bend the front axle proper and stretch it to its required length.

Stock for the front axle is first cut to length on a No. 2 Niles & Jones shear, which handles 300 pieces of stock an hour. A 4-in. Ajax forging machine is then used to upset and bend each end, this operation proceeding at the rate of

188 ends an hour. A 5000-lb. Erie hammer and a Bliss press are used for blocking, finishing and trimming each end, after which the forgings are given a bench inspection. The parts are then heated in the central section, put into a specially Ferracute press, shown in one photograph, where they are bent and stretched to proper length. This work proceeds also at the rate of 188 an hour.

They are then heated, quenched and annealed, after snagging on a No. 35 Ransom grinder. After a torture test on a 92½ Toledo press they are ground for a Brinell test,

10	Assemble one brake shaft assembly r. h. and l. h. onto front axle.....	Bench
11	Assemble brake assembly on axle putting cam end in spindle bolt housing first.....	Bench
12	Assemble spring and ball seat assembly in connecting rod and put in adjusting screw.....	Bench
13	Assemble connecting rod on spindle arm balls.....	Bench
14	Put on spindle nut.....	Bench
15	Paint one coat of Primer and bake one hour at 250° heat.	

PREPARATION and Assembly of Front Axle, Showing Forging of the Axle in an Erie Hammer and Bending of the Axle to Exact Finished Contour by Means of Special Dies. The heating oven appears at upper right. The drawing shows assembly of one axle

straightened in a Ferracut press, put through a pickling operation on a conveyor and finally given a bench inspection for cracks. They are then ready for machining.

A special Ingersoll milling machine handling 65 pieces an hour mills the spindle and spring perch bosses, after which a four-spindle Foote-Burt drill drills spindle and spring perch bosses and reams them at the rate of 40 an hour. Two 9/16-in. holes are then drilled and reamed, on a 21-in. single-spindle Cincinnati drill press. A similar machine takes care of the next two operations, which are the countersinking of four 11/16-in. and two 9/16-in. holes and the spot facing of two 9/16-in. holes. Finish milling of the spindle bosses is done on a No. 32 Kempsmith milling machine at the rate of 80 an hour. After this the axle receives one coat of paint and is dried in an oven at the rate of 400 an hour. The accompanying photographs show the dies, hammers and work at various stages of the forging operation.

The nine operations in the forging and forming of the left-hand spindle arm are graphically shown in a progress photograph. Until one actually sees the progressive steps whereby a straight bar of steel is forcibly cajoled into yielding this grotesque but most efficient form one can hardly believe that such a result is possible. Forged flat, the two arms are finally brought to their final shape by bending over a die in the Bliss press shown in another illustration.

Six actual operations and the machines upon which they are performed are detailed in tabular form. Two of these lists of operations appear alongside the illustrations showing respectively the left-hand spindle arm and the front axle assembly. The others follow:

Spindle Arm—Right

No.	Operation	Machine	No. Per Hour
A	Cut to length	H. & J. guillotine-type shear	1,000
B	Heat	Furnace	90
C	Forge	1000-lb. Erie hammers	90

3	Thread	Special Ford threaders; Special threading machine	200

Seams in Forgings Defined

A special committee was appointed in 1926 by the American Society for Testing Materials to consider whether it is possible to prepare a definition of "seams" and "injurious defects" so as to be available for the interpretation of these words when they appear in specifications for forgings. After considering the wide variety in the design and uses for forgings, it was voted by the committee at its last meeting that the definitions already proposed are as good as can be formulated. These are as follows:

A seam is a separation of the metal as determined by splitting of a chip taken at right angles to or parallel with the direction of the seam.

Seams or other surface imperfections in finished forgings will not be considered injurious if they can be removed by machining the surface of the forging to a depth of 1/64 in. for each inch in diameter of the forging.

The depth of the imperfections may be developed by taking several light cuts with a chipping tool until the deepest chip does not break at the line of the imperfection, or by filing or machining at right angles to the line of the imperfection until its depth has been established.

Completes New Foundry for Compressor and Engine Gray Iron Castings

THE Chicago Pneumatic Tool Co. has completed a new foundry at Franklin, Pa., for the production of gray iron castings for the air compressors and engines manufactured at the company's Franklin works. A storage shed measuring 60 x 330 ft. has also been erected. The new foundry building is 130 ft. wide and 220 ft. long and is ad-

jacent to the main plant, which consists of power house, machine shop, erecting floors, pattern shop, offices and shipping platforms.

The buildings and foundry equipment, which is of modern design throughout, represents an investment of more than \$400,000. The equipment includes two cupolas, one of 16

Equipment of the New Chicago Pneumatic Tool Company's Foundry Is of Modern Design Throughout. It includes two cupolas, several molding machines and automatic hopper type sand handling units. The type of building construction may be noted from exterior view above

tons per hour capacity and the other with half that capacity, 8 tons per hour. Two rotary blowers have been installed and crane equipment includes five traveling cranes, three of which are of 15 ton capacity, one of 10 ton and one of 5 tons, and yard cranes. Several molding machines of various capacities from 1000 to 20,000 lb., and including four squeezers, have been installed. Other major equipment includes three hopper-type automatic sand handling units, mold drying ovens and two large and four small core ovens. A daily capacity of 30 tons is provided, with ample pro-

vision for doubling this tonnage to meet the needs of growth of the business.

Approximately 225 men will be employed. It is stated that the new foundry unit will permit complete supervision of every step entering into the manufacture of the company's products, from raw material to the finished machines.

The company has other large plants at Detroit and Cleveland, where pneumatic and electric tools are manufactured.

Use Foreign Structural Steel Warily

Method of Manufacture and Lack of Usual Tests Cast Suspicion on Uniformity and Acceptability for Important Structures

A WARNING has been issued by the American Institute of Steel Construction, through its executive director, Charles F. Abbott, that the structural steel now being imported into the United States has not been made under the specifications customarily imposed on American steel. Consequently it should be used with caution, and placed into important structures only after careful and systematic testing indicates that its quality is uniform and better than the minimum limits of strength assumed by the designing engineer.

While taking the stand that a technical association such as the institute is not concerned in political matters, Mr. Abbott's statement points out that his organization is vitally interested in the quality of the material which goes into construction work. The institute has evolved standard specifications for steel construction work which have been adopted by practically every city in the United States. These standards require that the steel measure up to the high quality specified by the American Society for Testing Materials.

Imported Structural Steel Mostly Bessemer

"If the material passes these tests it may be made by either the Bessemer or the open-hearth process," the statement continues. "Bessemer steel is not so uniform in quality and we realize that only when the steel is made by the open-hearth process can we be fully assured that it will meet the high standards required."

"Inasmuch as most of the imported structural steel is produced by the Bessemer process a word of caution is issued to building owners in the United States. Foreign steel produced by the Bessemer process should be subjected to the most rigid tests before it is incorporated in any American structure. Aside from the chemical structure of the foreign material it not infrequently happens that its geometric proportions also make it inferior for American practice. Our 12-inch beams have a certain desirable flange width, and their webs a specific thickness. On the other hand, the European product has less metal in the flange, which makes it easier to roll but less efficient per pound of steel. In the United States a uniform quality of steel is used and, no matter what mill may make the beam, it is produced according to known standard specifications. It is inspected before it leaves the mill to determine whether or not it meets the necessary requirements."

"It will be wise for steel contractors not to look for price savings in the purchase of foreign-made structural steel, for in most cases nothing is gained thereby. Should a consignment of steel reach here and be found impractical for use, much time is lost by replacing that shipment by the domestic product. Word comes from Miami, Fla., that construction work on the Twelfth Avenue bridge is held up because the steel was purchased in Europe. Owing to a

strike, the shipment is still held in a Belgian port. The contractors would have completed their work May 15 but for this delay in receiving the steel.

"Not all losses are incident to delays in delivery, when a contract is based upon foreign steel. Some contracts in Brooklyn, N. Y., were held up because the foreign steel did not measure up to specifications and American material was substituted. Albert E. Kleinert, building superintendent of Brooklyn, states that he has found imported structural steel 10 per cent weaker than domestic structural steel. Europe does not find it necessary to make structural steel to American standards, for they usually construct buildings not over five or six stories in height, where strength of material is not so important."

Foreign Mill Tests and Markings Inadequate

"Domestic steel manufacturers make and record the tests made on each melt, which record can be compared and checked against the finished steel from each melt. It is generally impracticable to obtain such a record on steel imported from abroad. Tests made after its delivery are inadequate. In May of this year certain steel reported to have been imported was tested at Columbia University. The results of that test were not conclusive, and were so reported by building inspectors, for they established only the value of the pieces actually tested and failed to connect them with all the imported steel in question."

"The American Institute of Steel Construction, Inc., is not opposed to imported steel because it is foreign made, but it is opposed to anything that tends to lower American standards. If foreign steel is to be imported for structures here it should be subjected to the same rigid tests at the mill to which we subject our domestic product, and when it fails to meet those requirements its use in buildings and bridges should be prohibited."

The effect of nutritious food upon the health and consequent efficiency of employees and the inadequacy of commercial facilities for the needs of many industrial establishments has led to the installation by many companies of industrial lunch rooms, the problems of which are amply set forth in a booklet issued by the National Industrial Conference Board, Inc., New York. Types and physical characteristics of lunch rooms are fully covered together with their management and cost. In summing up it is brought out that "the most popular type of lunch room for all types of plants is the cafeteria, which requires managerial skill and a considerable outlay of money for its operation. As a result a number of companies that find it urgent to install luncheon facilities, but impractical to engage in a program of management and finance foreign to their business, deem it advisable to turn the management of their cafeterias over to concessionnaires."

Cutting Up Massive Scrap

OXY-ACETYLENE cutting is used so frequently and to such good effect in dismantling and wrecking operations that it now excites little comment. Such equipment is also used to advantage in scrap yards to supplement the drop ball and the alligator shear in the job of reducing ungainly or massive pieces of cast iron or steel to charging box size.

Photographs by courtesy of The Linde Air Products Co.

GASES may be obtained from individual cylinders of compressed gases, or from a central station where the oxygen and acetylene are generated and piped to various outlets. Frequently, portable acetylene generators are used to advantage. As shown in the view, a small generator, rated at 45 cu. ft. of acetulene an hour, can produce enough gas to cut through a cast iron fly-wheel rim, 3 1/4 in. by 24 in. with a 6 1/2 in. web.

HEAVER cutting on cast iron may be done by cutting half way through from one side, then turning the piece over and completing the job. The view shows a block 24 in. thick being reduced to smaller pieces in this manner by a workman under close supervision of another, skilled in cast iron cutting.

* * *

PLAIN carbon and alloy steel can be cut with an oxy-acetylene flame much more readily than cast iron. Twelve-inch armor plate may be trimmed to shape or cut into small section by a special blowpipe mounted on a simple traversing mechanism, driven by a long screw.

BULKY and intricate material, ranging from a steel ship down to a locomotive, offers no particular difficulty to a scrap yard properly equipped with blowpipes and handling equipment. A double walled firebox, with numberless rivets and stays, would probably cost more than the old material is worth to dismantle in any other way than by gas cutting.

Leaves from the Diary of a Foundry Apprentice

BY H. A. FROMMELT*

March 4.—Only here a month and a half, but I feel like an old-timer; not a bit sore, fit as a fiddle and liking this game better every day. Jack says you get to feel like the papa of a new born baby, without the after effects of doctor's bills, every time you see yourself as the "daddy" of a nice, bright, bouncer of a steel casting. "Jack has got right," as the Dutchman on our scenic railway would say. (Until I rode on the crane in our bay I wondered why they called it the "scenic railway"; now I know.)

March 10.—Received a schedule of "Related Studies" for the full four years. With the 4 hr. per week of home study, we "go to school" in actual time more than one year—1600 hr. to be exact. They spoke of this apprenticeship as "more an education than just a job" at the first interview. I was reminded of it yesterday while looking over a circular on apprenticeship that the company publishes.—That reminds me, must give that to Andy C., who is interested in this apprenticeship business.—Well we'll see. I'm going to copy the schedule here and check it off as they hand it out to us piece-meal.

Available Time:	Hr.
200 hr. per year obligatory on company time, four years	800
200 hr. per year prescribed home study, four years ..	800
Total available for related studies	1600
Time Required for:	
Related trade studies	891
Average number of unit lessons	54
Average time to complete each	16.5
Inspection trips (four trips per year, four hr. each) ..	64
Technical lectures (0.5 hr. each four hour period, or 25 hr. per year)	100
Non-technical lectures (same as technical)	100
Collateral trade and technical reading and study	100
Advanced studies (junior foremanship)	345
Technical Lectures (Illustrated)	
1. The Making of Iron and Steel, six half-hour lectures ..	3
2. Elementary Metallurgy, twelve half-hour lectures ..	6
3. Heat Treating, twelve half-hour lectures	6
4. Alloy Steels, six half-hour lectures	3
5. Company Products, twelve half-hour lectures	6
6. Modern Machine Shop Practice, twelve half-hour lectures	6
7. Modern Pattern Shop Practice, twelve half-hour lectures	6
8. Modern Foundry Practice, twelve half-hour lectures	6
9. Modern Industrial Buildings, six half-hour lectures ..	3
10. Materials Handling and Equipment, twelve half-hour lectures	6
11. Economics of Mass Production, six half-hour lectures	3
12. Modern Management, twelve half-hour lectures	6
13. Modern Foundry Sand Control, six half-hour lectures	3
14. Open-Hearth and Electric Steel Castings, twelve half-hour lectures	6
15. Power in Modern Manufacturing, twelve half-hour lectures	6
16. The Specialty Steel Castings Field, twelve half-hour lectures	6
17. Steel Castings, twelve half-hour lectures	6
18. Production Schedules and the Customer, six half-hour lectures	3
19. Financing Modern Business, twelve half-hour lectures	6
20. Miscellaneous, twelve half-hour lectures	6
Total	105

*Consultant, St. Louis.

Non-Technical Lectures. The Apprentice as:

1. Learner (Attitude in shop toward fellow apprentices, journeymen, foremen, et al.), 16 lectures, one hr. each	16
2. Employee (As a producer, manufacturing costs, etc.)	16
3. Member of Community (Civic and social obligations, home owning, etc.). 16 lectures	16
4. Member of Industrial Society (Labor policies, organizations, etc.)	16
5. As An Individual (Duties to self, safety, hygiene, etc.)	16
6. Future Journeyman (Opportunities, obligations, etc.)	16
Grand Total	96

Can you beat that! I never thought a hard-boiled foundry outfit would get down to figuring out the number of hours it took to complete a lesson. Supervisor Haney is certainly some generalissimo. He explained the course of studies in a general way and said that I would undoubtedly become better acquainted with it as time went on. I'll say I will, if I know anything about the way they run things around here. Last week a probationer was let out because he failed to keep up with his related studies. Mr. Haney explained that "related studies" mean studies related to the work we are doing in the shop. (Phew! that's the longest entry I've made in you yet, Diary, old dear.)

March 15.—Just returned from my first inspection trip. We visited our own machine and erecting shops. Did I say visit? It was harder than a shopping trip on bargain day that mother talks about. These are not inspection trips; they're detection trips—detect all the information that's lying around loose in 4 hr. and then write a report of 500 words to be handed in the following week. No foolin' about this. I thought it would be a little half holiday, but no such luck in an apprentice's life around here. Well, at any rate, learned all about the company's product, where our castings go and what they have to contend with in the machine shop. Scraping bearings on a big turbo-generator is some job. Give me the foundry any day. I don't like that close work. Setting small cores is bad enough.

March 22.—Thought I knew something of our product after that inspection trip. But after Mr. Haney quizzed me I decided to get a catalog and make some detection trips of my own.

March 30.—Young Delaney was made one of the chief foundry inspectors today. Graduated only a year and a half ago. Jack says he was not the brightest in the group, but very dependable and a chap who gets along with everybody. That seems to be most of an inspector's life, anyway.

April 10.—It's time I got caught up on some of these things I have been wanting to know about, for instance, ladles, stoppers, heads and risers, carbon and silicon, sulphur and phosphorus, silica wash, etc. I'll make a schedule of my own and check them as I get the answers.

April 15.—A shifted core! Who would have thought that a core had any shift left in it after a mold was nicely closed and all clamped down. One of my first core jobs—and of course the detective department—by the way, it was that Delaney, just turned inspector, who did the snooping—traced it to me and I couldn't disown the brat. There it was just like it had a floating rib. Naturally it had to be scrapped. Well, experience is a dear teacher—for the company in this case.

April 16.—The foreman of the training bay, Mr. Howard, demonstrated just how a core must be set so that it won't get St. Vitus dance when the mold is poured. I never realized that liquid metal pressed so hard against all parts of the mold, but it seems all so easy now that it has been explained. And me thinking I was ready to be promoted to other work!

A Short-Time Business Forecaster

Unfilled Orders of Steel Corporation and Building Contracts Presage
General Trend, Says Alvan T. Simonds

A SHORT-TIME forecaster of business is described in the September issue of *Looking Ahead* by Alvan T. Simonds, president Simonds Saw & Steel Co., Fitchburg, Mass. This forecaster is based on prospective operations in the steel and building industries as indicated by unfilled orders of the Steel Corporation and awards of building contracts. On request Mr. Simonds will forward a detailed statement to any reader showing how the forecaster has been worked out.

This type of forecaster contrasts with one covering long-time movements outlined in previous issues of *Looking Ahead*. It was pointed out that, since the war, business has moved in short cycles of about three years in length; that is, with the peaks about three years apart and the lowest points about three years apart. Downward movements in

Sales of the Company Have Followed the Indicator, with Lag of Only a Month or Two

business, according to this analysis, have been preceded by rising money rates and upward movements by declining money rates. Mr. Simonds' article in the September issue of *Looking Ahead* follows in abstract.

From the fall of 1926 to the end of 1927, money rates moved down for about 15 months. If the regular sequence since the war is continued, the general movement of business will now be upward to a peak in 1929. Since the beginning of 1928, money rates have moved up sharply, and if money rates continue to move up for a few months more and the regular sequence since the war occurs, business will move down from the peak in 1929 for a time approximately equal in length to that of the upward movement in money rates. How much longer money rates may continue to move up is decidedly uncertain. We have called attention to the fact that the common error in comparing money rates with business movements is to expect that with a major change in the direction of money rates a change upward or downward immediately takes place in the movement of business. As a matter of fact, since the war the change has not begun until 12 to 15 months later than the turning point in money rates.

Election May Alter Business Trend

Everyone realizes that there is now an added complication that may decidedly affect the state of business in the United States in the fall of 1928 and for some months following. This is the presidential election. There are many who believe that the election of one of the candidates might result in a depressing influence upon business, severe enough to modify or even decidedly change what would have been its normal and regular movement. For this reason in this issue of *Looking Ahead* we are showing a short-time forecaster which we have found reliable in forecasting the sales of the Simonds Saw & Steel Co. Any favorable or unfavorable influence arising out of the Presidential election will show itself in this forecaster before it

does in the movement of general business and before it does in the sales of Simonds Saw & Steel Co. or those of other companies dependent upon general industrial activity. As we have stated before, the sales of the Simonds Saw & Steel Co. run practically parallel to general business and, even with less variation, parallel to the volume of manufacture in the United States. Anyone interested in forecasting the sales of a particular business can, of course, readily chart the sales and compare their movements with the movements of the short-time forecaster shown in this issue.

Prosperity Depends on Three Industries

Good business and widespread prosperity are assured so long as three great industries are growing in activity and in volume. These are the steel, the building, and the automobile businesses. If on the day that this article is being prepared, we could know just how much business is ahead of the steel industry for three or four months, and for the same length of time how much business is ahead of the building industry and how much is ahead of the automobile industry, we could know very accurately what is ahead of our business for that time. We are not able to get the amount of production ahead in the automobile industry. We can however get the figures for the unfilled orders of the United States Steel Corporation, which is so large a factor in the steel industry, and we have reports of building contracts awarded in 37 States. On the tenth of every month, therefore, we know quite accurately just how much work lies immediately ahead of two of the three greatest manufacturing industries in the United States.

The chart shows combined in the forecaster the movement in *work ahead* in steel production and in building. Changes in direction of this movement are regularly announced by a hesitation in the index for a month or longer; that is, instead of moving up or down, it moves horizontally. If it is going up and the horizontal movement takes place, it indicates that it is to be followed by a downward movement. If the movement is downward and the horizontal movement takes place, it indicates that it is to be followed by an upward movement. A study of the chart will show that this forecaster gives us advance notice of major changes up or down in the sales of the Simonds Saw & Steel Co.

French Steel Manufacturers

The annual directory of steel manufacturers of France, the *Annuaire* for 1927-1928, is of the same bulky proportions as its predecessors, a book about 5 x 8½ in. in size of page but near 2½ in. thick, having some 1400 pages. Over one-third of the book comprises advertisements of the supply and construction trades serving the steel industry. These are classified into 28 divisions, so that there is in fact a double directory, one of the steel producers and one of the supply industries, so to speak, those which supply the raw materials, build the plants and provide rolling machinery, furnaces, prime movers, material handling machinery and the like. The directory proper, besides an alphabetical arrangement of plants, gives a grouping according to products and also according to regions. Indexes include names of individuals mentioned, as well as the firm names, both being given in regional groups and alphabetically. The *Annuaire* is published by the Comité des Forges de France, 7 Rue de Madrid, Paris (VIII), France.

Where Steel Exports Went in First Half-Year

Canada Took 284,661 Tons of Nine Leading Items—Japan Retains Second Position with 78,120 Tons, Followed by Argentina, 39,387 Tons; China, 30,179 Tons; Mexico, 26,500 Tons; Brazil, 24,493 Tons

Exports from United States, by Countries of Destination

Gas Producer Arranged for Full Mechanical Operation

INCREASED gas making capacity and lower power, steam and water consumption are claimed for a new gas producer, designated as the type SB, which has been brought out by R. D. Wood & Co., 400 Chestnut Street, Philadelphia. The equipment operates on the same principle as the company's "heavy-duty" gas producer and is arranged for full mechanical operation, from the feeding of the coal to the removal of the ashes.

Arrangement of the machine may be noted from the accompanying illustrations. The fuel bed is agitated positively by means of a straight poker bar, which can be replaced conveniently. The mechanical coal feeder has no metal-to-metal contact between the stationary housing and the multiple pocket drum, which construction is emphasized as markedly reducing wear. Gas leakage between the stationary and moving member is prevented by a water seal.

The revolving ash pan is supported by three accessible conical rollers and rotates at the same speed as the producer shell, which arrangement is intended to prevent grinding of the ashes and subsequent increased resis-

porting construction of the producer as a whole, permitting of installation independently of the producer building, is another feature emphasized. Three columns carry the conical shell supporting rollers and the horizontal thrust rollers. The top plate, which is water cooled, is of steel plate construction heavily reinforced by structural shapes and provided with checkered cover plates. The foundation for the producer, of simple layout, requires approximately 15 cu. yd. of concrete.

Data from Mill Installation

The following operating data, furnished by the Wood company, is from a steel mill installation. The coal gasified is Lincoln Gas Coal Co., egg and nut "Pittsburgh vein" of the following analysis: Moisture, 1.38 per cent; volatile matter, 38.40; fixed car-

Agitation of the Fuel Bed During Six Revolutions Is Shown in Diagram Above

bon, 55.90; sulphur, 2.16, and ash, 5.70 per cent. The B.t.u. per lb. are 13,580 and the fusing point of the ash is 2200 deg. Fahr.

Rate of gasification, depending upon the demand of the heating furnaces, varied from 3750 to 5800 lb. per hr. or from 47.8 to 73.8 lb. of coal per sq. ft. of fuel bed area. Gas produced from this coal was of uniform quality and averaged 162.3 B.t.u. (low value at 62 deg. Fahr.) per cu. ft. containing 46.5 per cent combustibles. The average gas analysis is given at: CO₂, 5.8 per cent; CO, 26.2; CH₄, 3.8; C₂H₄, 0.8; H₂, 15.7; O₂, 0.2, and N, 47.5 per cent.

The following analysis of the producer ash is offered by the company as indicating how thoroughly the coal is converted into gas, the carbon content being only 0.355 per cent of the total carbon contained in the coal as charged into the producer. The average ash analysis is: Silica, 43.10 per cent; aluminum, oxide, 25.95; ferric oxide, 23.35; sulphur, 0.44; phosphorus, 0.06; lime, 1.50 and carbon, 5.60 per cent.

It is stated that during the period of observation, several months, no hand poking was done and the fuel bed at all times was level and loose, permitting a ½-in. diameter measur-

ing rod to be pushed down its entire length. A gas temperature of 1400 deg. Fahr. was maintained, no hot spots nor blow holes were developed and the wall remained free of clinker. Ashes were plowed continuously. The turbo-fan blower operated at approximately 50 lb. steam pressure and the total power consumption under maximum load was less than 3 hp. The

Mechanical Ash Discharge. The ash pan, supported by conical rollers, rotates at same speed as the producer shell

agitating bar used 270 gal. of cooling water per hour, the overflow cooling the top-plate.

Machine Shop Meeting at Cincinnati

Among the papers scheduled for the machine shop practice meeting of the American Society of Mechanical Engineers at Cincinnati, Sept. 24-27, inclusive, are the following:

Airplane Production Problems, by R. W. Daniels, Baush Machine Tool Co., Springfield, Mass., and E. T. Jones, chief engineer, Wright Aeronautical Corporation, Paterson, N. J.

Theories of Bearing Lubrication, by Forrest E. Cardullo, chief engineer G. A. Gray Co., Cincinnati, and Analysis of Bearing Lubrication, by A. L. Jenkins, professor of mechanical engineering, University of Cincinnati.

Symposium on Machine Tools—Automotive Industry, by L. L. Roberts, mechanical superintendent Packard Motor Car Co., Detroit. Electric Industry, by J. R. Weaver, superintendent of manufacturing equipment, Westinghouse Electric & Mfg. Co., East Pittsburgh, Pa. Agricultural Implement Industry, by Max Sklovsky, chief engineer Deere & Co., Moline, Ill. Railroad Industry, by L. A. North, shop superintendent Illinois Central Railroad, Chicago.

The meeting provides for numerous plant inspection trips and two night trips by river steamer to Ashland, Ky., and return. Two technical sessions will be held on the boat and at Ashland will be visited the continuous sheet mill of the American Rolling Mill Co. A banquet is scheduled for Wednesday evening, Sept. 26, at which E. A. Muller, president King Machine Tool Co., and vice-president of the American Society of Mechanical Engineers, will be toastmaster.

All Operations, From Feeding of Coal to Removal of Ashes, Are Mechanically Actuated

tance to the passage of the blast. The ash plow is of adjustable type, to permit continuous plowing of the ashes regardless of the amount of coal gasified, and a stationary agitating blade is provided to further agitate and move the ashes from the center of the producer toward the outside of the ash pan. The driving mechanism for continuously rotating the producer shell and agitating the poker bar is of simple design, each motion being actuated from a single shaft and without the use of levers, links or universal joints.

Maximum economy in steam consumption and close control of blast saturation is said to be assured by the turbo-fan blower employed, which is of multiple steam nozzle design and is noiseless in operation. Self-sup-

Small Electric Handsaw in Three Models

A NEW 2-in. capacity electric hand-saw, features of which include ruggedness of design and the use of a patented safety guard, has been added to the portable electric tool line of the Wappat Gear Works, Inc., Pittsburgh. The machine is intended for cutting all kinds of wood, soft metals, bakelite, fiber and other material, and is offered both for production and maintenance work.

Three models are available, one for plain square cutting, another, shown in the illustration, for bevel cutting, and a third having an adjustable dado cutter for grooving. On all models the shoe is adjustable vertically, which permits setting of the saw to cut to a predetermined depth. The lower saw guard completely incloses the saw blade, opens gradually by telescoping into the upper guard as the saw is

As the Saw Is Pushed Into the Material the Lower Guard Opens Gradually by Telescoping Into the Upper Guard. The shoe is adjustable vertically to permit cutting to predetermined depth. It immediately snaps shut when the cut is finished

pushed into the material, and immediately snaps shut as the cut is finished.

The machine is equipped with a high-speed fan-cooled universal motor which is furnished with ball bearings, and the arrangement is such that a blast of air is thrown to the front of the saw, thus clearing away the sawdust and permitting following the line closely. The saw shaft is mounted on tapered roller bearings and is driven by helical gears. The gears are mounted in ball bearings, which are entirely inclosed and run in grease.

A double-pole non-arcng switch is mounted in the handle within easy reach of the operator's forefinger. The frame is of aluminum. All exposed steel parts of the machine are rust-proofed and in order to provide light weight and strength some of the parts are made of heat-treated aluminum alloy. A steel saw-table, measuring 16 x 26 x 11-in. high, can be furnished.

New Vertical Spindle Grinders

THE Hisey-Wolf Machine Co., Cincinnati, has added to its line a vertical-spindle grinder which is available in three types, having vertical, horizontal and double slide adjustment, respectively, the last named type, with the double slide adjust-

be done at one setting. The grinders are available in 1, 2 and 5-hp. sizes for alternating current and in 3-hp. for direct current. The 1-hp. machine, equipped for 220 or 440 volt three-phase alternating current, has a no-load speed of 3500 r.p.m. and em-

plays a cup wheel 6 in. in diameter, 3¼ in. high and a straight wheel 7 in. in diameter, 1 in. face. The weight is 110 lb., net. The largest machine of the same series operates at 1750 r.p.m., no load, takes an 8 x 4-in. cup wheel and a 12 x 1½-in. straight wheel. The weight of this size is 280 lb., net.

Vertical Spindle Grinder with Double Slide Adjustment. Machines with vertical and horizontal slide adjustment, respectively, are also available

ment, being shown in the accompanying illustration.

The machines are designed primarily for thrust grinding with the spindle in the horizontal position or with the grinding wheel swung down at any angle. Ball bearings, inclosed in leak-proof housings and lubricated constantly by a bath of oil, are used throughout. When employed in conjunction with a boring mill many internal and surface grinding jobs can

Improved Blacksmith's Hammer

THE Blacker Engineering Co., Grand Central Terminal, New York, is marketing an improved model "B" blacksmith hammer, which is offered as a one-man power-operated tool, dispensing with the services of a striker. The machine retains the principles of the company's previous hammers but has been improved in a number of details and is larger and heavier. Thrust bearings are now employed in connection with the control mechanism and the motor drive has been rearranged to provide greater compactness of the machine as a whole.

The machine is essentially a power-operated sledge which works upon an ordinary anvil and requires the usual

hand anvil tools. A link motion provides positive control of the blows. The head has lateral traverse along the anvil face, with automatic knock-offs over the two hardie holes. The traverse of the head is controlled by the winged foot-lever shown at the right of the anvil, while the force of the blow is controlled by varying the amount of depression of the foot treadle which extends around the anvil. The blow struck may be varied from a light tap to about four times as heavy as that of a man striking. The hammer is arranged to strike up to 140 blows per min. It is rated to work 2½-in. and larger material.

Double shouldering operations may be done on the anvil illustrated, which

Compact Arrangement of the Driving Motor Is an Improved Feature. The hammerhead may be traversed over the anvil face and strikes made at the rate of 140 blows per min. The force of the blow may be regulated

has a central cutout, as shown. This anvil is of special design and is finished to its block, which is fitted with adjusting screws. A 1½-hp. motor is

employed for the drive, the motor being connected to the driving shaft and flywheel by a fiber pinion and large driving gear.

Arc-Welded Overhead Traveling Crane

IN a new design of overhead traveling crane of the Cleveland Crane & Engineering Co., Wickliffe, Ohio, the bridge girders, end trucks and trolley are constructed by arc welding. Illustrations are from a 5-ton

welded to the standard I-beam sections. Riveted girders of similar construction would employ a channel section instead of the two angles. However, this extra material would, it is said, give less strength and rigidity.

Welded Parts for Crane. In addition to the welding shown on housings and guards above, each girder of the crane has angles arc welded the entire length to the standard I-beams. Two smaller arc-welded trolleys are shown at right, their frames being formed by welding the pieces together

crane of the I-beam girder type, with span of 38 ft. 9¼ in.

Each girder is reinforced throughout its entire length by angles arc

The girders are attached to the end trucks by notched or shoulder construction designed to prevent weaving. To facilitate shipping, the gird-

ers and trucks are disassembled. The field connection is made by bolts, but additional arc-welded reinforcement is recommended to secure maximum rigidity. The end trucks themselves are built up of two standard channel sections joined by arc welding. Roller bearings are used on this crane, permitting rapid acceleration and low power consumption.

Two small standard arc-welded trolleys are illustrated. Each trolley frame is made of a standard channel with arc-welded braces under each bearing point. Gear guards are arc welded, as is also the hand rail on the foot bridge and the bearing supports for the bridge drive shafts.

The welding on this crane was done by Lincoln electric machines. The advantage claimed for arc-welded crane construction, other than greater rigidity and strength, is that a more effi-

cient distribution of weight is possible, thus making it possible to lighten certain moving parts and thereby to obtain greater acceleration.

Boring and Turning Bars for Use on Lathes

ADJUSTABLE boring and turning bars designed for use on lathes have been placed on the market by Scully Steel & Iron Co., 2364 South Ashland Avenue, Chicago. They are

In addition to boring and turning, the bars can be used for both external and internal threading. They are of one-piece construction and of special alloy steel, with ends heat treated. The holders are arranged so that the bars can be adjusted over a wide

range. Large bearing surface is provided in the holder to assure rigidity of the bar, and the bar is maintained parallel with the center of the lathe. By reversing the holder the largest piece that the lathe will swing can be turned.

By Adjusting the Bar in the Holder Any Desired Rake of the Cutters Can Be Obtained

offered in five sets with bars ranging from ¾ in. in diameter by 14 in. in length to 3 in. in diameter by 30 in. in length, and equipped with ¼ in. to ⅝ in. cutters.

British Association Issues Drill Specifications

A STANDARD specification for twist and straight fluted drills has been issued by the British Engineering Standards Association. Standard diameters, overall lengths and flute lengths for the various types of drills and the dimensions of the Morse taper shanks are given.

Limits are laid down for variation in diameter of the drills, and performance tests are specified for both carbon and high-speed drills from No. 60 to 2-in. diameter, inclusive. The performance tests consist in drilling a series of holes in steel billets of a

given analysis. Penetration per minute and the number and depth of the holes to be drilled are specified, but the r.p.m. and the feed per revolution are left to the discretion of the maker. The drills must withstand these tests without seizing, choking or fusing, and the points of the drills and the lips must be in good condition and fit for further service without regrinding on completion of the tests. Standard nomenclature and definitions for the different types of drills in common use are also included in the specification.

British Pig Iron Exports Improving

Steel Market Affected by Summer Quiet—European Mills Busy with Domestic Orders—Japan Imports Less Finished Material

(By Cable)

LONDON, ENGLAND, Aug. 20.

THE iron and steel markets are quiet as Cleveland plants have closed for the annual holidays. Palmers Steel Co., Ltd., is closing for a period, thus blowing out two blast furnaces, but Dorman, Long & Co. are resuming operation of one furnace at Newport on hematite and one Carlton furnace on ferromanganese.

Demand for hematite has improved, especially in the export market, and makers have advanced prices as stocks have diminished. Foreign ore is quiet.

Finished iron and steel is generally dull but makers are expecting a revival of demand in the early autumn. Shipbuilders' orders are scarce and

export demand for heavy steel is quiet. Building constructors and engineering plants are moderately active.

Tin plate is steadier on improved demand and some fair business has been booked by Welsh mills. A number of mills have decided to begin the agreed period of suspension at the end of the current month, when restriction begins as they are in need of orders for September shipment, but are well booked for October to December delivery.

Galvanized sheets are quiet, but the price is well maintained and Indian demand is expected to revive soon. Black sheets continue quiet.

Continental markets are firm as a result of sustained domestic demand, but sales to British users are small.

try almost self-sustaining in that product. By next spring it is expected that there will be two new privately owned sheet mills in operation in addition to those now in production, which include the largest producer, the Kawasaki Dockyard Co. at Kobe. Japanese galvanizing plants now claim that the product of the Kawasaki company is in every way equal to the best brands of American and British mills. The Imperial Steel Works, as recently reported, is rapidly increasing its production of tin plate, which is still well below the total requirements of the country.

The development of steel production in Japan is changing the character of Japanese buying, resulting in smaller purchases of finished products and a heavier demand for semi-finished materials, as has been predicted for several years. There is a larger demand for billets, blooms and sheet bars, but this material, as in the case of plates, shapes and bars, is bought almost exclusively from European makers, at lower prices than can be obtained from mills in the United States.

Importers of steel in New York report moderate activity in bar-sized angles and still have some substantial tonnages arriving, in most cases of material bought at lower than the current European quotation. Although the price represents only a small sav-

Japan Importing Less Finished Steel

Almost Self-Sustaining in Sheets and Is Increasing Tin Plate Output—Buys More Semi-Finished in Europe

NEW YORK, Aug. 21.—Export trade with the Far East continues decidedly small. No real buying movement has yet developed in the Chinese market, and Japanese merchants and consumers are limiting their purchases because of the low exchange value of the yen. The decrease in Japanese

buying that has been so much in evidence in recent months is viewed by some exporters to Japan as a permanent condition. They are of the opinion that by the end of this year little sheet business can be expected from Japan, as increased domestic capacity has already made the coun-

British and Continental European prices per gross ton, except where otherwise stated, f.o.b. makers' works, with American equivalent figured at \$4.86 per £ as follows:

(a) Nominal.

ing from the present quotation of domestic makers, some business is still being done in hoops and bands. Another advance has been made by European mills in the price of bars and shapes, and plain steel bars of Thomas grade are quoted today at about 1.85c. per lb., c.i.f. New York, which is too high to permit any sales. No further action on the tariff reclassification of reinforcing bars, bar-sized shapes and the question of marking foreign steel is expected until fall.

Germany Works for Simplification of Shapes

HAMBURG, GERMANY, Aug. 4.—Standardization work in the German steel industry is being further extended. The list of ordinary sections for all structural shapes, including beams, tees and channels, is to be revised, reducing the number of standard sizes by about 40 per cent. German mills are cooperating with the Saar and Austrian industries so that the new standards will be widely accepted. The new list is to be published next month, after which it will be open to general discussion and amendment by the interested mills for a period of three months.

Germans Reduce Price of Magnesium Alloy

HAMBURG, GERMANY, Aug. 4.—Following the recent reduction in the price of aluminum, German makers of "electron" (magnesium alloy) and the Czechoslovakian, Swiss and Italian licensees, have reduced the price by £7 10s. per ton (1.65c. per lb.), to avoid losing business to the aluminum producers. It is expected that a further reduction in the price of electron will be made at a meeting of the Central European producers at the end of this month. Output of the alloy in the first half of 1928 exceeded the production in the first half of 1927 by about 40 per cent.

Belgian Prices Still Rising, with Exports Good

ANTWERP, BELGIUM, Aug. 3.—Despite the recent holiday period, the steel market continues active and prices are becoming firmer. Export demand is good, especially from India and China, and mills are in most cases unable to offer better than October delivery.

Pig iron is in active demand and prices are strong, with ordinary No. 3 phosphoric foundry iron quoted for export at about £5 15s. (\$27.95) per ton, f.o.b. Antwerp. Scarcity of supplies of semi-finished material has caused further strengthening of prices on billets, blooms and slabs. Only a few makers are in the market. Current quotations range from £4 7s. to £4 14s. (\$21.14 to \$22.84) per ton on blooms, £4 15s. 6d. to £4 17s. (\$23.20 to \$23.57) on billets and about

£4 18s. (\$23.81) per ton, f.o.b. Antwerp, on sheet bars.

Orders for finished steel are in good volume, and mills are quite generally quoting deliveries beyond Oct. 1. Prospective buying by foreign consumers has had a good effect on the market, and prices are still advancing in expectation of continued export business. Prices on steel bars show some irregularity, as practically all mills are seeking small tonnages of certain sizes to complete their rolling schedules. Quotations range from £5 15s. to £5 16s. 6d. per ton (1.27c. to 1.29c. per lb.). Beams are slightly less firm as a result of weakness in quotations by French sellers. Beams continue at £4 18s. 6d. per ton (1.08c. per lb.), angles at £5 13s. 6d. per ton (1.25c. per lb.), corrugated bars at £5 19s. per ton (1.31c. per lb.), and hot-rolled hoops at £6 17s. 6d. per ton (1.52c. per lb.), all f.o.b. Antwerp.

Russia Hires German Steel Workers as Foremen

HAMBURG, GERMANY, Aug. 4.—The Russian Soviet Government has apparently changed its policy of excluding foreign workmen from its steel plants and has contracted with a number of German skilled workers, who leave this month to take positions in Russian steel plants as foremen and superintendents. The Germans, 27 of whom are from Solingen, 110 from Dortmund open-hearth plants and about 400 from various other mills in Germany, will receive about two and a half times more in wages than the Russian steel workers.

German Wire Mills Using Fewer Wooden Reels

HAMBURG, GERMANY, Aug. 4.—Wire manufacturers have apparently finally been successful in introducing steel wire reels for barbed wire instead of the usual wooden reels. The steel wire reels reduce the total weight by about 1½ per cent, making the railroad and ocean freight rate on export shipments lower. The wire mills claim that the Latin-American, Asiatic and Indian markets are accepting increasing quantities of wire furnished on wire reels.

Ore Imports by Germany Large in June

HAMBURG, GERMANY, Aug. 4.—Importation of iron and manganese ore was quite active in June, with arrivals of 1,165,000 tons of iron ore and 28,000 tons of manganese. There were practically no arrivals of Swedish iron ore because of the strike at the Swedish mines, which only recently ended. Prices on manganese ore have been about 15d. (30c.) per unit for 48 per cent and 16¼d. (32.5c.) per unit for 52 per cent Caucasian. Bilbao ores have sold at 19s.

(\$4.62) per ton for 50 per cent and French ore at 16s. 3d. (\$3.95) per ton for 48 per cent, c.i.f. Rotterdam or Emden.

Carnegie Company to Build Pittsburgh Warehouse

The new Pittsburgh warehouse of the Carnegie Steel Co. to replace the old one on Eleventh Street, the site of which recently was acquired by the Pennsylvania Railroad, will be located on part of the site of the McCutcheon mills of the company, on Reedsdale Street, North Side. The site contains more than 3 acres. The main warehouse buildings will consist of four parallel buildings or bays covering a space of 287 x 387 ft., of steel construction with corrugated galvanized steel roofing and siding.

In each of three of the bays there will be one 10-ton double-trolley overhead traveling crane, while the fourth bay will have two of this same type. Auxiliary buildings will include the present office of the McCutcheon mill and the machine shop, the latter to serve as a substation, sanitary station and garage. Standard-gage tracks will be provided to connect with railroad trunk lines.

Electric power will be supplied by the Duquesne Light Co. through an 11,000-volt transmission line to the substation, which will be equipped with three 350-kva. power transformers, one 100-kva. lighting transformer and two 200-kw. motor-generator sets.

The plant will be equipped with modern warehouse machines such as friction saws, bar, plate and angle shears, punches, drill presses and riveting machines. The engineering features of this new warehouse have been worked out by that department of the steel company, and it is expected to be ready for operation by the end of the year.

Production Basis of Aircraft

With the recent announcement by the Stout Metal Airplane Co. (Division of Ford Motor Co.) that it has established a production program providing for two tri-motored transports per week, Detroit aircraft production has now reached a total of 50 per week. The Stinson Aircraft Corporation is producing 25 planes per month and the Buhl Aircraft Corporation 18. In addition to these three companies there are in the Detroit area 39 companies producing aircraft motors, parts and supplies.

A newcomer in the field, announced last week, is the Verville Aircraft Co., which is backed by the Briggs Body interests. The new company will occupy the old Rickenbacker plant, having 300,000 sq. ft. of floor space. This will be the largest aircraft plant in the Detroit area and one of the largest in the country. Production will begin at once on small, low-priced planes and flying boats.

Jones & Laughlin Group Insurance

Company Announces Contract Providing Employees with \$25,000,000 of Group Life Insurance and Sickness and Accident Benefits

THE Jones & Laughlin Steel Corporation, Pittsburgh, has announced a contract with the Metropolitan Life Insurance Co., New York, providing the 25,000 employees of the corporation and its subsidiaries with \$25,000,000 of group life insurance. The contract also provides \$25,000,000 of accidental death and dismemberment insurance and substantial weekly benefits for sickness and accident. The insurance is being issued on a cooperative basis, whereby the corporation and its employees share the premium cost. This fixes the worker's share at less than 5c. a day and provides him with insurance at from one-ninth to one-third of the cost he would otherwise pay, depending upon his age.

"After studying the problem," said T. M. Girdler, president of the Jones & Laughlin company, "we decided that the plan should include a life policy for \$1,000 payable at death, which contains a total and permanent disability clause making the amount of the policy payable in monthly installments, with interest, in case such disability resulted before the insured attained the age of 60, benefits of \$12 a week for a period of 13 weeks for employees incapacitated by sickness or non-occupational accident, and a special indemnity of \$1,000 for accidental death or dismemberment.

"The insurance is offered without medical examination to every employee actively at work, irrespective of age, sex or physical condition. This is an important provision, as statistics show that one in every 12 examined for individual insurance is rejected by the insurance companies as unfit.

"In case of total and permanent disability, the insurance provides that after an employee has drawn his temporary benefits of \$12 a week for 13 weeks, he will then draw the face value of his policy in equal monthly installments for the following 40 months. Thus the combined benefits for totally and permanently disabled employees will cover a period of three years and seven months. These benefits in no way interfere with or take the place of any Workman's Compensation benefits.

"In addition to the actual insurance and other protection, each insured employee will receive periodically pamphlets dealing with the preservation of health and the prevention of disease."

More than 15,000 of the Jones & Laughlin employees, who will benefit by this insurance are engaged at the South Side, North Side and Aliquippa works and the remaining 10,000 are distributed throughout the district sales offices and subsidiary companies.

Chairmen Selected for Steel Treating Sessions

Chairmen and vice-chairmen for the 10 technical sessions of the annual convention of the American Society for Steel Treating have been selected and are announced as follows:

Monday, Oct. 8

Morning session. Chairman: R. M. Bird, district sales manager Midvale Co., New York, and chairman Philadelphia convention committee. Vice-chairman: R. H. Patch, research department E. F. Houghton Co., Philadelphia, and chairman Philadelphia chapter.

Afternoon session. Chairman: Albert E. White, director department of engineering research, University of Michigan, Ann Arbor, Mich. Vice-chairman: Victor O. Homerberg, assistant professor of metallurgy Massachusetts Institute of Technology, Cambridge, Mass.

Tuesday, Oct. 9

Morning session. Chairman: J. A. Mathews, vice-president and director of research development Crucible Steel Co. of America, New York. Vice-chairman: Marcus A. Grossmann, metallurgical engineer Central Alloy Steel Corporation, Canton, Ohio.

Afternoon session. Chairman: T. D. Lynch, consulting metallurgical engineer Westinghouse Electric & Mfg. Co., East Pittsburgh, Pa. Vice-chairman: Edgar

C. Bain, research department United States Steel Corporation, Kearney, N. J.

Wednesday, Oct. 10

Morning session. Chairman of the annual meeting of the American Society for Steel Treating: Fred G. Hughes, president of the American Society for Steel Treating and vice-president and director New Departure Mfg. Co., Bristol, Conn.

Chairman of the Campbell Memorial Lecture: Dr. George K. Burgess, director of United States Bureau of Standards, Washington.

Afternoon session—joint meeting of Institute of Metals and American Society for Steel Treating. Chairman: Dr. Zay Jeffries, consulting metallurgist Aluminum Co. of America, incandescent lamp department of the General Electric Co., Cleveland, and National Tube Co., Pittsburgh; vice-chairman of the Institute of Metals, and vice-president of American Society for Steel Treating. Vice-chairman: R. S. Archer, metallurgist research bureau, Aluminum Co. of America, Cleveland.

Thursday, Oct. 11

Morning session. Chairman: Dr. Albert Sauveur, professor of metallography and metallurgy Harvard University, Cambridge, Mass. Vice-chairman: J. P. Gill, metallurgist Vanadium Alloys Steel Co., Latrobe, Pa.

Afternoon session. Chairman: J. Fletcher Harper, research engineer, Allis-Chalmers Mfg. Co., Milwaukee. Vice-

chairman: Francis H. Clark, metallurgist Western Union Telegraph Co., New York.

Friday, Oct. 12

Morning session. Chairman: Bradley Stoughton, professor of metallurgy Lehigh University, Bethlehem, Pa. Vice-chairman: E. F. Cone, associate editor THE IRON AGE, New York.

Afternoon session. Chairman: W. Trinks, professor of mechanical engineering Carnegie Institute of Technology, Pittsburgh.

Morning sessions will be held in the ball room of the Benjamin Franklin Hotel, the society's headquarters, and the afternoon sessions are scheduled for the assembly room at the Commercial Museum where the National Metal Exposition will be held.

New England Industries Meeting

A New England Industries meeting will be held by the American Society of Mechanical Engineers at Boston, Oct. 1, 2 and 3, with headquarters at the Statler Hotel, that city. The general topics to be covered include materials handling, management, education and training for the industries, machine shop practice and power. Among the papers scheduled are the following:

Apprentice System of Lynn Plant, General Electric Co., Charles K. Tripp, supervisor of apprentices, General Electric Co., Lynn, Mass.

Experience in the Selection of Apprentices with the Aid of Tests, Walter S. Berry, director of training, Scovill Mfg. Co., Waterbury, Conn.

Handling Marine Shipments of Pulpwood; Improved Methods for Large Operation, D. W. Coe, vice-president and general sales manager Canadian Mead-Morrison Co., Ltd., Montreal.

Handling in Sugar Refining, C. G. Spencer, Baker & Spencer, Inc., New York.

Air Transportation in Relation to New England, Sumner Sewell, traffic manager Colonial Air Lines.

Aviation Engines, A. Willgoos, chief engineer Pratt & Whitney Aircraft Corporation, Hartford.

Review of Ball and Roller Bearings in Aircraft, F. W. Mesinger, Norman-Hoffman Bearing Corporation, Stamford, Conn.

Design of Columns of Varying Cross-Section, A. Dinnick, professor of mechanics, Institute of Mines, Dniepropetrovsk, Union of Soviet Socialist Republics.

Mechanics of Plate Rotors for Turbo-Generators, J. P. Den Hartog, Westinghouse Electric & Mfg. Co., East Pittsburgh, Pa.

Progress in New England, William J. Fortune, vice-president National Shawmut Bank, Boston.

Proper General Management of Industry, Jerome R. George, vice-president Morgan Construction Co., Worcester.

Tests on Belleville Springs Made by the Ordnance Department, U. S. A., D. A. Gurney.

Belleville Springs, A. M. Wahl, research department, Westinghouse Electric & Mfg. Co.

Developments in Internal Grinding, Alden M. Drake, chief engineer Greenfield Tap & Die Corporation, Greenfield, Mass.

Power Supply for New England Industry, Frank M. Gunby, engineering manager Charles T. Main, Inc., Boston.

Ohio Foundrymen Meet at Cedar Point

Molding Sand Receives Much Attention—Merchandising Foundry Products—Insurance and Compensation

MATTERS affecting the foundry industry were discussed at the eighth annual convention of the Ohio State Foundrymen's Association, held at Cedar Point, Ohio, Aug. 16 and 17. One of the two sessions was devoted to workmen's compensation, insurance and safety, these subjects being discussed by representatives of the Ohio Industrial Commission. There was the usual attendance of over 100.

Announcement was made of the resignation of Arthur G. Tuscany, who has been secretary-manager of the association for the past six years, and who will sever his connection with the organization Sept. 1 to become secretary of the recently organized Gray Iron Institute, which will establish its headquarters in Cleveland. Mr. Tuscany's successor has not yet been named. There is a possibility that the headquarters of the Ohio association will be moved from Cleveland to Toledo.

All the old officers were re-elected: President, C. C. Smith, Toledo Steel Casting Co.; vice-president, Don McDaniel, Hamilton Foundry & Machine Co., Hamilton; treasurer, Edgar Sands, Superior Gas Engine Co., Springfield. The following new members were elected to the board of administration: W. P. Anglemeyer, Star Foundry Co., Troy; Charles E. Dine, Minster Machine Co., Minster; Robert Hopkins, Alliance Brass & Bronze Co., Alliance; E. A. Leary, Cincinnati Steel Casting Co., Cincinnati; Charles Seelbach, Forest City-Walworth Run Foundries Co., Cleveland.

To Change Name of Association

The association is taking steps to change its name to the Ohio Foundries Association and it will be incorporated shortly under the latter name.

Eighteen new members were added during the year and five were lost, according to the report of Secretary Tuscany. He outlined some of the activities of the association during the year, mentioning particularly the establishment of a reader service department, to keep members informed about articles referring to the foundry industry in the trade and technical press. This service, he said, had been favorably received. He announced that the Ohio Industrial Commission has recently reduced the insurance rate for brass and aluminum foundries from 80 to 70c. for each \$100 of payroll.

President Smith in a brief annual report outlined some of the services

rendered members by the association and urged the cooperation of foundrymen. He said that there had been some extensions of the plan of holding group meetings of members located in a city or immediate territory, and he favored the formation of additional groups.

Better Merchandising for Foundry Products

Changes in conditions relating to the sale of castings were pointed out by H. Cole Estep, vice-president Penton Publishing Co., Cleveland, in a discussion of "Merchandising Foundry Products." "It is now necessary to create a market situation which will make it possible to develop profitable trading," he declared. Foundrymen have been thinking in terms of production, but it is now important to think of buying and selling—the trading end of the business. The day castings were bought is gone, he declared; today foundrymen must get out and sell their product.

Group competition by makers of forgings, stampings and other metal products makes it necessary for the gray iron foundryman to adopt better merchandising methods. Foundrymen have not been alert in maintaining the position they are entitled to in the engineering field. The speaker stressed the statement that consumers' specifications for castings have not kept up with the improvement in the quality of castings. He urged foundrymen to impress on buyers the improvement that has been brought about in the quality of castings. This would counteract the effect of the propaganda of some of the makers of competitive products.

Steel and malleable foundries have done good work in extending the use of their products, according to the speaker, but gray iron foundries seem to have lagged. The gray iron industry, because of its excess capacity, needs efforts in this direction more than the steel and malleable foundries.

The speaker made several suggestions regarding merchandising castings. He urged an improvement in the quality of product, saying that too many bad castings are still being made. Foundrymen should do their part in creating a satisfactory price situation. There is no excuse, he said, for selling castings on a base pound price. An equitable price situation should be established, not based on pig iron prices. Every foundryman should preach the gospel of castings. Gray iron foundries are bound to lose some business to competitive products and must develop new out-

lets for castings. He said there are probably 1000 new uses for castings for foundrymen to dig out.

Three Things to Watch in Molding Sand

An interesting talk on foundry sand was given by H. W. Dietert, chief industrial research engineer United States Radiator Corporation, Detroit, who took for his subject, "The Required Foundry Knowledge on Molding Sand." Three things, he said, should be watched in controlling foundry sand. These are the sand grains, clay and water. Grains give permeability and structure and assure a smooth finish on the castings. They also impart uniform color to the castings. The grains also have insulating properties. He favored using as fine a sand as possible, to give castings a fine finish. Clay has various effects, providing strength or bond and reducing permeability. Both clay and water increase scabs. Water increases the amount of sand grains sticking to the pattern, causing a rough finish, and decreases the amount of ramming force necessary.

The speaker listed the various ways of testing sand for temper, permeability and strength. In his opinion dry bond strength has not received enough attention. The methods of changing sand conditions to provide moisture, permeability and strength were outlined. He warned against allowing night gangs to place too much burnt core sand in the heaps. One foundry had increased dry sand strength by adding Bentonite and had reduced losses 40 per cent. The cost of molding sand, he said, could be reduced by the use of high-bonded new sand, the use of a good mixing system in not dumping heap sand, reducing the amount of molding sand entering the cleaning room and reducing the core sand entering the heap sand from castings.

Taxes and Insurance Rates

Probably two-thirds of the Ohio corporations pay more in taxes than in dividends, declared George B. Chandler, secretary of the Ohio Chamber of Commerce, Columbus, in a talk on taxation and public expenditures and their relation to Ohio business. He characterized the corporation franchise tax in Ohio as a pernicious form of taxation and said he hoped that the State would be able to save enough in other ways to permit it to eliminate that tax.

Considerable light was shed on the operation of the Industrial Insurance Department of the State by W. T.

Leonard, member of the Industrial Commission of Ohio, who took for his subject, "Industry's Big Asset." He said that the present Ohio insurance rate for gray iron foundries of \$1.20 for each \$100 of payroll is lower than in many other States, and that the maximum death award of \$6,500 and the weekly indemnity of \$18.75 are higher than in other States. In New York, he said, iron foundries pay a rate of more than \$3 for each \$100 of payroll. Rates in other States he named were: Illinois, \$1.61; Indiana, \$1.67; Michigan, \$1.63; Pennsylvania, \$1.35; Kentucky, \$2.34. The Ohio rates for steel, malleable and brass foundries are lower than those in other States, according to the speaker.

E. I. Evans, actuary of the Ohio Commission, discussed insurance rates and how they affect premiums. H. P. Sutherly, Columbus, in a talk on "What You Should Know About Industrial Claims," gave considerable information relating to rulings of the Ohio commission and statutory regulations regarding insurance claims. He stressed the importance of giving men physical examinations before employment, for the reason that, should an employee make an injury claim, it is important that the employer know of any disability which may have existed previously. This knowledge would protect the employer from claims that might be made for disabilities incurred previous to the man's employment.

Enormous losses that industries are suffering because of industrial accidents were pointed out by Fred G. Lange, special representative of the division of safety and hygiene of the State Industrial Commission, who said that in the industries in Ohio there are 1000 deaths and 200,000 injuries in a year. Employees are paying \$18,000,000 a year directly for these losses, to the State and for self insurance, and an insurance company has figured out that the indirect losses are four times as great as the direct ones.

Most of these accidents, he said, can be prevented. The most important single factor in accident prevention is the attitude of the manufacturer, declared the speaker. He should realize that accidents can be prevented. A man properly qualified should be put in charge of the safety department; this work should not be entrusted to a mere clerk. No expenditure will bring greater returns than accident prevention. Not only will it pay in direct savings, but also in improving the morale of the organization. Safety rules, such as requiring the wearing of goggles, should be strictly enforced. He urged the provision of all proper mechanical safeguards, shop committees on safety and other inter-plant safety committees.

An informal banquet was held Thursday evening, after which there was speaking and dancing. President Smith acted as toastmaster.

Inc., by the Republic Iron & Steel Co. follows a series of absorptions by the latter company over a period of several years, the last previous one being the taking over of the properties of the Trumbull Steel Co., Warren, Ohio. . .

Under the terms of the merger the Republic company will acquire a majority of the Steel & Tubes, Inc., common stock at the equivalent of \$170 a share. Terms provide that for each share of common stock Steel & Tubes stockholders will receive \$50 face amount of 6 per cent debentures of Steel & Tubes; 8/10 of one share of non-par \$4.50 dividend class A preferred Steel & Tubes stock; 5/10 of one share of non-par \$4.50 dividend class B preferred Steel & Tubes stock and 7/20 of one share of common stock of the Republic Iron & Steel Co.

Brown-Fayro Co. Buys Mine Pump Line

The business of the Austin Mine Gathering Pump Co. has been sold by Dravo-Doyle Co., Pittsburgh, to the Brown-Fayro Co. of Johnstown, Pa. The latter will maintain a Pittsburgh office and warehouse at 104 Market Street, in charge of Edward F. Austin as vice-president and manager. Mr. Austin has severed his connection with Dravo-Doyle Co. to take this new position. The Dravo-Doyle Co. has transferred its entire stock of mine pumps and repair parts to the Brown-Fayro Co. In the mining field Dravo-Doyle Co. will continue to handle the equipment of the DeLaval Steam Turbine Co., Shepard Electric Crane & Hoist Co., Cochrane Corporation and the C. H. Wheeler Mfg. Co.

Republic to Acquire Steel & Tubes, Inc. Youngstown Company Will Take Over Cleveland Company Making Electrically Welded Steel Tubing and Other Products

THE consolidation of Steel & Tubes, Inc., Cleveland, with Republic Iron & Steel Co., Youngstown, Ohio, has been effected, subject to the ratification by the stockholders of the former company. This merger will furnish the Republic company important additions to its present line of products, and at the same time will supply it with an outlet for considerable semi-finished steel. Steel & Tubes, Inc., has been buying from 3000 to 4000 tons of steel per month in the open market, largely in the form of billets, but its purchases include a small tonnage of both hot and cold-rolled strip in widths that it does not manufacture.

The principal product of Steel & Tubes, Inc., at present is electrically welded steel tubing, which is made under the Johnson patents, which it controls. The company also makes high carbon butted and brazed pipe and shortly will begin the manufacture of light steel conduit to be used in the building field. It is also a seller of both hot and cold-rolled strip steel when its steel output exceeds the requirements of its tube making departments.

Myron A. Wick, president of Steel & Tubes, Inc., will continue to manage its plants and will become a director and member of the executive committee of the Republic company.

Steel & Tubes, Inc., is the successor of the Elyria Iron & Steel Co., which was organized in 1902 and built a small rolling mill plant in Elyria, Ohio, for rerolling old rails and new billets into structural shapes, tie plates, tubing and other products. In 1915 it built a plant in Cleveland for the manufacture of light welded steel tubing by the oxy-acetylene welding process and moved its headquarters to that city. The demand for light steel tubing from the automotive and other industries grew rapidly and the company expanded to take care of this demand. Last fall it took over the Mohegan Tube Co., Brooklyn, and shortly afterwards the change in name was made. Another recent purchase was the plant of the Standard Steel Tube Co., Toledo, Ohio. It also has plants under construction in Detroit and in Brooklyn, the latter for making conduit.

The acquisition of Steel & Tubes,

American Electrochemists Establish \$100 Prize

An annual prize of \$100 in gold has been established by the board of directors of the American Electrochemical Society for the best paper printed in the two volumes of any year of the *Transactions* by a student or young college graduate under 27 years of age. The judges to pass upon the merits of the manuscript are to be the members of the publication committee, this committee being at liberty to invite the opinion of members not on the committee, if they choose. The first prize of \$100 is to be awarded for the best paper presented at the spring and fall meetings in 1929. This prize is to be known as the American Electrochemical Society prize—to be available to all American or foreign technical schools and colleges, to students and young instructors—the object being to stimulate original work and encourage participation in the proceedings of the society by scientifically and technically trained men at an age when normally modesty keeps them in the background.

This Issue in Brief

Physical examinations for prospective employees would save employers large sums in insurance claims. Ohio industries alone suffer 1000 deaths and 200,000 injuries annually, for which employees are paying \$18,000,000 a year in insurance.—Page 474.

* * *

Blades of stainless steel in steam turbines preserve original polish after 3471 hr. use, while nickel steel blades reveal usual corrosion. Stainless steel valves for airplane engines also prove successful because of non-corrosive elements and high strength at elevated temperatures.—Page 454.

* * *

Cylinder molding unit in automobile foundry has produced 1600 castings in 16 hr. Using old methods without conveyor equipment, only 300 cylinder blocks were produced in 9 hr., with twice the floor space.—Page 450.

* * *

Steel company provides employees with \$25,000,000 of group life insurance. Similar amount is provided in accidental death and dismemberment insurance and sickness and accident benefits, with total cost to worker of only 5c. a day.—Page 472.

* * *

Urges rigid tests of imported structural steel before use in important structures. American Institute of Steel Construction head says foreign product should meet standards specified by Society for Testing Materials before leaving mill.—Page 462.

* * *

Foundrymen should think in terms of buying and selling rather than production, says convention speaker. Improvement in quality of castings should be stressed and new fields for products opened.—Page 473.

Molds made entirely of dry sand cores have displaced green sand molds in manufacture of automobile cylinder block castings at Dodge plant. Castings so made are more uniform in dimensions, in metal thickness and in weight, as mold is said to be held to closer limits.—Page 449.

* * *

Sheet steel industry has expanded sharply in spite of competition of other products. Production increase of 12 per cent in first seven months of 1928, compared with corresponding period last year, with gains of only 6 and 10 per cent respectively in steel ingot and automobile production, indicate success of sheet makers in extending their products into new fields.—Page 476.

* * *

Enlarged dock facilities at Chicago encourage movement of iron and steel on Great Lakes. One new dock has ore-handling capacity of 4000 tons daily, can handle pig iron by means of magnets at rate of 150 tons an hour and has unloaded structural steel sections in lengths up to 90 ft.—Page 453.

* * *

Stainless steel is used in pistons for hydraulic pumps with satisfactory results in England. Piston used continuously for three years was reduced only 0.04 mm. in diameter, while phosphor bronze pistons were 2.8 mm. smaller.—Page 454.

* * *

Outlines method of forging and forming Ford front axles. After cutting to length, a 40-in. forging machine is used to upset and bend each end, and a 5000-lb. hammer and press are employed for blocking, finishing and trimming. Bench inspection follows, after which parts are heated in central section and bent and stretched to proper length in special press.—Page 457.

Homogeneous metal, practically negligible losses of manganese, few non-metallic and gaseous inclusions and the possibility of hotter steel are advantages of making manganese steel in basic electric furnace. Production costs are higher, however, as compared with open-hearth process.—Page 456.

* * *

Some over-capacity is necessary if industry is to go forward, says editorial writer. Labor and mechanical limitations naturally prevent 100 per cent operations, and progress is possible only when old and obsolescent plants are constantly being replaced by new and efficient facilities.—Page 476.

* * *

Good business and prosperity depend upon activity of steel, building and automotive industries, says New England manufacturer. Unfilled orders of Steel Corporation and reports of building contracts enable forecaster to know accurately how much work lies immediately ahead of these two industries.—Page 465.

* * *

Continued growth of United States trade with South America is thought certain by Chilean Ambassador. Says financial and commercial expansion after war resulted largely from the economic potentiality of United States rather than from weakness of Europe.—Page 478.

* * *

Bottom pouring method in making austenitic manganese steels makes for quicker teeming, more uniform pouring conditions and better yield of sound metal, says metallurgist. After teeming, molds should be stripped from ingots as soon as possible and ingots should be delivered to soaking pits at high initial temperature.—Page 456.

THE IRON AGE

W. W. MACON
Managing Editor

ESTABLISHED 1855

Some Over-Capacity Is Normal

SO much has been written about the evils of over-capacity one would almost think it a recently developed ailment. To cite a few late statistics: It appears that the blast furnaces are making about 72 per cent as much pig iron as they could (if all of them ran at rated capacity without interruption); structural steel fabricators are operating at about the same rate; manufacturers of steel barrels, even though they broke all records as to numbers made, operated at only 61 per cent of capacity; steel foundries at 59 per cent; bituminous coal mines at a fractional rate, and so on. It would almost seem that rapid transit (so called) is the only industry without surplus capacity—and even that has seat room in the middle of the day.

As a matter of fact, over-capacity has been with us these many years. Smooth operations demand a certain amount of stand-by plant to "take up slack" and for reserve when those unforeseen emergencies arise. In other words, a certain amount of idle machinery is normal; that amount must be exceeded before there is any real "surplus" capacity, just as there must be an excess over a normal amount of idleness before a state of unemployment can fairly be said to exist. Doubtless there is much surplus capacity in the steel foundries, when they can operate at only 59 per cent. But just as truly there is no over-capacity in open-hearth furnaces when they are operating at 85 to 90 per cent.

As is well known, 100 per cent operation is impossible to maintain, either from labor or mechanical limitations. Perhaps 10 per cent idleness is normal; only when this figure is considerably exceeded should there be cause for concern. Even so, there are other aspects of the situation.

Would an electric furnace company decline to equip another steel foundry? Would a textile machinery manufacturer refuse an order for a new weaving plant? Or even would a rolling mill manufacturer seriously question the business sanity of a customer who wanted to build a sheet mill? Such business not only tends to the prosperity of the machinery and construction industries, but it is clear evidence of vitality in the others. Only by continuously replacing the old and obsolescent with the new and highly efficient can any industry go forward. Only by bringing in new blood, venturesome souls, clear-eyed to see the trend in demand and the opportunities for economies, can any enterprise prosper unless it be a monopoly.

Thus we come to the second point. Before paying too much attention to the cry of over-capacity, find out whether the jeremiad comes from one who expects an old plant and a mid-victorian product to return him

good profits in this year of 1928. If so, cross him off the list. His is the sad situation of the racer left at the post.

Notable Expansion in Sheets

COMPARING the first seven months of last year and this, there were increases of about 6 per cent in steel ingot production, 12 per cent in sheet production and 10 per cent in automobile and truck production. These divergent figures are of special interest and furnish some food for thought. The steel ingot production is known with ample accuracy. Sheet tonnage is computed from the fact that for the seven months of last year the sheet association reported 2,061,776 net tons produced by an average of 72.9 per cent of the industry, and for this year 2,269,823 tons by 71.7 per cent. There is other information indicating that the non-reporting sheet producers had substantially the same increase as those reporting, from which it may be computed that in seven months sheet production was about 2,525,000 gross tons last year and 2,825,000 gross tons this year.

When ingots increase 6 per cent and sheets increase 12 per cent there is a noticeable divergence. When it is considered that for several years strips have been replacing sheets in certain classes of consumption, and for two years past the sheet industry has been concerned over the prospects of the wide strip, the divergence from what one might expect is just so much more pronounced. In passing, it is regrettable that there are not more monthly statistics of production of finished steel lines.

One may say that this is a much better automobile year than last, but the production statistics indicate only about 10 per cent increase, and it is the automobile trade in particular that has been mentioned as tending to replace sheets by strips.

That the sheet producers have made strenuous efforts to dispose of their product is well known. They have pursued an intensive and commendable campaign to introduce their product into new uses and to advertise the new uses so as to make them spread. They have quoted very close and highly competitive prices, at the same time insisting that the market prices so developed do not afford a fair return by way of profit.

The sheet mills have had a high production relative to their capacity. The independent sheet mill reports show for six months an average of 96.5 per cent and for seven months, including the relatively low 82.2 per cent for July, an average of 94.5 per cent. The percentages are computed against an assumed capacity that is evidently somewhat low, for the "mechanical operation,"

in turns worked to turns possible, was lower than the percentage computed by tonnage; but it also was high, apparently the highest in any finished steel line outside of tin plate.

Altogether it would seem that the sheet industry is a thriving one in point of demand relative to capacity, in point of growth of its customers, and in point of its successfully meeting the competition of other materials, the one thing lacking being a financial return in keeping with these conditions.

Gains from Stabilized Prices

THE economic theory of the advantage of transparency in industry leads to stability of prices. Transparency in industry means the ability to look through it, to be able to discern and understand conditions. The greatest agency contributing toward that ability is statistical survey, which means simply the ascertainment of economic facts and making for convenience a numeral instead of a verbal expression of them.

Such an improvement in knowledge tends to eliminate the speculator, who has been defined as a person better gifted for seeing in the dark than are most persons. When there is no darkness that gift becomes valueless. Therefore speculators are not enthusiastic for transparency in industry.

Stability of prices is welcomed, however, by both producers and consumers. They are able to sit around a table in perfect accord as to this. It is welcomed likewise by the engineer who has to build things, and most of all by the laborer, who can easily see in it a symbol and promise for steadiness in employment and maintenance of fair wages.

In life, however, it is seldom that every one can be pleased. There are some interests that are quite averse to price stabilization. Professional speculators feel that way, as we have suggested above. So do brokers, whose functions as intermediaries in a fluxing market are curtailed, perhaps even extinguished. Professional purchasing agents likewise are piqued, for they lose their ability to demonstrate to their superiors how their expertness as buyers has beaten the quotational average. Such grievances may produce a lot of complaining, but as against the general benefit they are quite trivial.

Now, Mr. Ford!

HENRY FORD, a prominent manufacturer of Detroit, has done a number of things which bring him admiration from many sections of the American public. His interests, both personal and delegated, are multifarious, ranging all the way from transportation of living Americans to the preservation of relics of bygone generations. But there is one thing bearing his name which has been started and apparently has grown to considerable stature without his personal supervision. Something should be done about it.

We refer to the Ford apprentice school at the Detroit plant. In a description which has just come to hand is found this "Typical Questionnaire on 'Materials Used in Tool Room'", a questionnaire "to check

up a boy's knowledge." Here are some of the 83 questions asked:

33. Define steel.
12. What kind of steel is best suited for abrasion, impact and fatigue?
59. Which structure in steel is best, coarse or fine?
24. Name three "functions" of the blast furnace.
36. What effect has manganese on steel?
54. When is high-carbon tool steel used to best advantage?
65. What is martensite?

Now, Mr. Ford! Aren't these pretty stiff questions to put to a lad who has been fed some information on "Materials Used in Tool Room"? Professor Sauveur and Doctor Jeffries might be paged for an answer to No. 33 and No. 65, but it would surpass even their wits to know what a blast furnace has to do with a tool room. Something Edisonian in these and other questions makes us think of another and a much controverted test of intelligence, so called.

Or maybe—remembering that Mr. Ford has caused deep researches into the authorship of "Mary had a little lamb" and has verified the authenticity of the celebrated incident—maybe Mr. Ford has had some original investigations made on these matters which have so simplified and even standardized them that a tool-room clerk can grasp them. If so, pray tell us, Mr. Ford, for we have always wondered what kind of steel is best for abrasion, impact and fatigue, ever since the days when some of us helped harden rock drills.

Business and Stock Market Loans

SOME of the discussion over the large amount of borrowings by stock brokers has not given due weight to the influence of the rise in "big business." We have not fully correlated our knowledge. Constantly it is being said that big business is spreading. Now, big business does not borrow money; it lends money. The brokers' loans so much talked of and frequently criticized are largely loans for the carrying of shares of big business. What is more natural? Big business built up great reserves of liquid capital; it must keep the capital liquid and these loans are a good medium. Here are two things that have grown and their natural relation has been overlooked in some quarters.

One criticism of loans on stocks and bonds is that they reduce the opportunity of commerce to borrow money. But we have had two great trends. First, there is the expansion of big business, which lends instead of borrows, and if this expansion has been as large as is assumed, it involves a decrease in the borrowing requirements of business that is not big. Second, we have the great reduction in inventory by practically every one, correspondingly reducing the need of borrowing on the part of smaller business and increasing the amount of loanable funds of big business. An item worth considering in this connection is the movement in the steel trade whereby sellers who have been giving 2 per cent cash discount are disposed to reduce the discount to one-half of 1 per cent.

We shall do well to remind ourselves that this "boom" in the stock market, as it is still called, was originally called "the Coolidge boom." It was sup-

posed to be related to a conviction arising nearly four years ago that there was no danger that Mr. Coolidge would fail to be elected. When practically four years have elapsed there must be much more in it than that. As was pointed out in this department of THE IRON AGE last week, our stock market has become to a degree an intelligent and discriminating affair. There is confidence in the economic outlook. When money rates tighten, some who wish to borrow to carry shares in anticipation of higher values later may not do so, but others who have capital will in time take their place.

It would be foolish to attempt to argue that danger of a stock market collapse has been permanently removed, but it is proper to reflect upon the source of much of the money now being loaned in Wall Street, capital of large corporations whose managements certainly do not want to see their shares caught in a slump. While they may like to have their liquid capital earn a somewhat better return, they surely will be anxious and able to prevent such developments going too far.

In its latest bulletin the Cleveland Trust Co. presents two charts giving a broad view, from two separate angles, of the matter of gold, security loans and all other credit. To the layman, who hears these things talked of from divergent angles and may have difficulty in deciding which is the proper basis for making comparisons, the difference in appearance of these two charts is very helpful. Both charts cover six and a half years, from the beginning of 1922. Both depict gold supply, security loans and all other loans. One deals with relatives and takes 1923 at 100, showing security loans mounting much more rapidly than other credit. Whereas security loans start from less than 90 and wind up at over 180, other credit starts above 90 and ends at 125. Here is apparently a startling difference; but the other chart is quantitative instead of relative and looks quite different. The total bank credit rises moderately and the security loans are small relative to other bank credit, their proportion to the latter merely increasing somewhat. Either diagram alone would give the layman quite a different impression from that given by the other.

Will Latin American Trade Further Increase?

Chilean Ambassador Thinks Continued Growth an Expression of American Potentiality Rather Than Post-War Boom

ANSWERING the question, "Is the financial and commercial expansion of the United States a consequence of the war?" with an emphatic negative, Ambassador Carlos G. Davila of Chile looks upon the continued growth of trade with South America as a certainty. He regards as a normal phenomenon the continued growth of our trade which now enables us to furnish 39 per cent of the total imports of 20 Latin-American Republics, a greater proportion than United Kingdom, Germany and France combined.

"Precisely those years of rapid development that followed the war are those that serve best to illustrate that the commerce of the United States with the nations to the south has not for its basis the unstable factor of the post-war boom, but those factors which create a normal expansion in the commerce of a country: interior wealth, organization, rapid transportation, and productive technic," writes Senor Davila. "And it may also be observed here, that perhaps the dangers to this commerce from the post-war boom were much greater than the benefits. This exaggerated and speculative increase of the 1920-22 period surprised this country without the preparation necessary for adaptation, and launched it into profitable non-competitive markets, which could have created discredit and serious obstacles for the future and normal expansion of its commerce with Latin America. Happily, the period of readjustment that followed demonstrated the capacity of the American exporters to adapt themselves to the situation and to hold their advance in those markets. Furthermore, the reestablishment of the competitive situation between the United States and Europe is beneficial for this country as well as for ours. For ours, because it offers better opportunities of securing quality and of assuring low prices; for the United States, because competition gives a truly solid basis to its commerce, and creates impulses of continuous betterment that are indispensable for its prosperity.

"If we might draw a line to demonstrate the import and export commerce between the United States and Latin

America from 1913-14 to 1927, we should find a continuous and firm increase. It is evident that the war gave a tremendous impetus, but it may be observed that this maximum figure of the war period is \$10,000,000 less than the figure for 1927. It was in the period of feverish activity which followed the war that American commerce with our countries reached a fantastic figure which can be explained only by world speculation, the general inflation of values, and many other factors of commercial exaltation which characterized this post-war period.

"It is easy to note that the greater part of this commerce had a false and temporary basis, and so it may be said that the fall of 1920 to 1922 was as lightning-like as the rise. And here is where it may be clearly proved that the increase of commerce between the United States and the Republics of Latin America follows a normal development even today, in the same terms and proportions as in the years previous to the war.

"After the low post-war figure marked by 1922 trade with Latin America has gained back its normal line of development in the last five years. This is a decided refutation of the idea so strangely generalized that its increase was a consequence of the war, that is to say, due more to the weakness of Europe than to the economic potentiality of the United States."

According to the 1928 edition of the "Tractor Field Book," published by *Farm Implement News*, Chicago, the number of tractors in use on farms in the United States has increased 260,662 in the last five years, the 1928 estimate being 768,825. Increases were shown in every State except Montana. In 1925, according to the Bureau of Census, the total value of farm equipment in the United States was \$2,691,704,000, an average of \$6.87 per acre of crop land. The book contains specifications for various types of farm implements and classified directories of parts, materials, etc.

Analysis of Value of Mergers

The opinions regarding mergers of some 200 commercial and investment bankers were recently collected and analyzed by the Sherman Corporation, 292 Madison Avenue, New York, doing a business as engineer and business manager. Section one of a report, covering the current trend toward mergers and consolidations, has been issued and draws a number of conclusions, including this:

"The potential advantages to be gained from sound merger are today more in distribution than production and perhaps the factor of greatest possible advantage is reduction of selling costs through elimination of duplications in salesmen covering the same territory."

Other advantages proved are: Reduction of costs and overheads; reduction of prices to the consumer; broadened markets; the combination of diversified qualities of managerial abilities in a strong, cohesive organization, etc.

Optical Company Celebrates Seventy-fifth Anniversary

The seventy-fifth anniversary of the Bausch & Lomb Optical Co., Rochester, N. Y., is being celebrated this year. The company was started in 1853 by John Jacob Bausch, who came to this country from Germany in 1849. Henry Lomb, who also came to the United States from Germany in the same year, later became associated with Mr. Bausch as a partner. The early difficulties encountered and the manner in which these were overcome are given in detail in the anniversary number of the company's magazine for July-August. It is attractively illustrated.

Gives Reasons for Lower Sheet Discount

In announcing that, effective on business placed for shipment after Sept. 30, the cash discount will be $\frac{1}{2}$ of 1 per cent for payment in 10 days from date of invoice instead of 2 per cent as heretofore, the American Sheet & Tin Plate Co. says:

"In making this change in our policy we are not unmindful of certain benefits to be derived from a high discount rate, but the condition of the sheet metal business from the manufacturer's standpoint is so unsatisfactory that a high premium for prompt payment can no longer be made.

"There have been heavy reductions in the selling prices of sheets, but, in spite of these, there has been no change in our wage rates, or reduction in the quality of our products. Users of our material are obtaining better service than ever before and are no longer required to carry heavy stocks. These conditions have placed a burden upon the manufacturer

which compels him to look for other legitimate means of protecting his investment, and one of the most logical methods is presented in a reduction of our cash discount from an amount which economic conditions have not warranted for many years past.

"This applies only to sheet mill products and tin mill black plate."

Ohio River Steel Shipments 90,145 Tons in July

The monthly report of the United States Engineers Corps, Pittsburgh office, shows that 90,145 net tons of steel products were moved on the Ohio River during July. That total compares with 96,156 tons in June and 112,818 tons in May. For the seven months ended with July, 644,805 tons of steel products moved on the Ohio River, an average of 92,115 tons per month. In the same period in 1927 the total was 287,677 tons, a monthly average of 41,099 tons.

While the Ohio River figures include some interplant movements, they are primarily a picture of the shipments of finished steel products to lower Ohio and Mississippi River points that go by water, because water rates are much less than those of the railroads.

Tennant Steel Plant to Move to Portland

Tennant Steel Corporation, of which M. G. Tennant, mayor of Tacoma, Wash., is president, will move its plant at Vancouver, Wash., to Portland, Ore., where special attention will be given to alloy steel work. It is announced that two furnaces will be in operation shortly in the new location, and about 50 men will be employed. Harry E. Spieth is manager of the Portland plant. The Tennant Corporation of Washington has plants at Tacoma, Seattle and Everett. Mr. Tennant is president and general manager of the Oregon corporation and M. S. Alexander is assistant manager.

New Film on the Story of Rail Steel

"The Story of Rail Steel," an educational film in three reels produced by the Rail Steel Bar Association, has been released for distribution to architects, engineers, contractors, building officials, engineering students and all those interested in the relation of the steel industry to reinforced concrete construction. It will find considerable use by societies and universities at meetings, conventions and seminars.

The picture shows the manufacture of concrete reinforcement bars, portraying each consecutive operation, from the refining of pig iron to the final use of the bars in reinforced concrete construction. The supplying of the film is one of the educational

activities of the Rail Steel Bar Association, whose offices are in the Builders Building, Chicago, the members of which include rolling mills of the United States and Canada, in part as follows:

Buffalo Steel Co., Tonawanda, N. Y.; Burlington Steel Co., Hamilton, Ont.; Calumet Steel Co., Chicago; Canadian Tube & Steel Products, Ltd., Montreal, Que.; Connors Steel Co., Birmingham; Danville Structural Steel Co., Danville, Pa.; Franklin Steel Works, Franklin, Pa.; Laclede Steel Co., St. Louis; Missouri Rolling Mill Corporation, St. Louis; Pollak Steel Co., Cincinnati; West Virginia Rail Co., Huntington, W. Va.

State Department to Buy Sheet Steel Buildings

Bids will be opened Aug. 29, by the Pennsylvania Department of Highways, Harrisburg, on 23 steel storage buildings to be erected at Butler, Erie, Franklin, Clarion, Clearfield, Towanda, Montoursville, Danville, Pottsville, Selinsgrove, Chinchilla, East Stroudsburg, Honesdale, Beaver, Holidaysburg, Ebensburg, Huntingdon, Indiana, Somerset, York and Media. All buildings are to be 40 x 128 ft., except two at York, which are to be 40 x 112 ft. Suitable foundations for the buildings will be furnished by the Department of Highways.

Bidders for these contracts are required to submit, in addition to designs, shop drawings and illustrations of the buildings, samples of the sheets it is proposed to use, such samples to be not less than 1 ft. square. The successful bidder will be required to include in each shipment of material an extra sheet, so that a sample may be selected at random and used for test.

Linde and Prest-O-Lite Build New Plants

Six new plants for manufacturing cutting and welding gases have been put into operation since July. Four of these are new oxygen-producing plants of Linde Air Products Co. and are located at Harrisburg, Pa., Allentown, Pa., Shreveport, La., and Charleston, W. Va. This makes a total of 52 oxygen plants operated by the Linde company. A separate plant for producing dissolved acetylene has also been erected at the first two localities above mentioned by Prest-O-Lite Co., an associated organization.

Competitive examinations for junior metallurgists, with an entrance salary of \$2,000, are announced by the United States Civil Service Commission. Application must be filed before Sept. 25 with the commission in Washington. Full information may be obtained from the commission or from the board of examiners at the post office or customs house in any city.

Iron and Steel Markets

Market Strength Broadens

Upward Price Trend Extends from Finished Steel to Semi-Finished Products and Primary Materials—Pig Iron Advanced at Cleveland—37,000 Tons of Steel Placed for Pipe Line

THE iron and steel market shows evidences of growing strength in virtually all products, from finished steel to semi-finished products and primary materials.

Pig iron prices, which have been on a downward trend since the middle of March, are stiffening, notably in the Central West. Cleveland producers have raised prices 50c. a ton on foundry iron for shipment to outlying districts, and an advance by Chicago furnaces is expected shortly.

In the Valleys, prices on both basic and foundry iron are firmer and inquiries have been issued by four large melters. Steel companies that ordinarily market surplus iron are no longer seeking business, and one steel interest, finding its own pig iron output short of its requirements, is regarded as a probable buyer. A factor contributing to the revival of interest in basic iron is the recent sharp advance in scrap and its continued scarcity at higher levels.

Sales of merchant pig iron by Cleveland producers totaled 63,000 tons, following bookings of 84,000 tons in the previous week, and Chicago furnaces sold 50,000 tons. Several Central Western stacks are so well booked that they are out of the market for the rest of the year. Two merchant furnaces have been blown in, one at Dubois, Pa., and another at Buffalo, while the lighting of a stack at Chicago is an early possibility.

Price strength extends to furnace coke at Connellsville, which has been favorably affected by a second draft on the spot supply of beehive fuel by a steel producer.

Steel production continues at close to 85 per cent of capacity in the Greater Pittsburgh district and at a 75 per cent rate at Chicago. The average for all Steel Corporation subsidiaries is 77 per cent. New business is light in all products except pipe, but this is not surprising, since consumers are well covered for this quarter. Measured by specifications against contracts, the market is active. Shipping orders for bars and sheets are particularly heavy, and releases of hot and cold-rolled strip steel leave little to be desired.

The sustained volume of mid-season activity has given producers increasing confidence. Most producers of sheets, including the leading interest, have adopted the advances for fourth quarter recently announced, and virtually all sheet and strip mills have reduced the discount for cash payment to one-half of 1 per cent. In addition, sheet mills at Chicago are adding an extra of 10c. per 100 lb. for orders of less than 100 tons.

Bookings of the American Sheet & Tin Plate Co. were the largest for any week since late in 1925, and

independent sheet producers appear to have done correspondingly as well. Whether heavy specifying can be attributed to the lower discount, which becomes effective Oct. 1, or to the clause in third quarter contracts cancelling tonnage not released by Sept. 10 is not clear. Indeed, the Pittsburgh view is that neither of these factors is an important influence. Little evidence that consumers are stocking is seen, and current activity is ascribed to an unusually well-maintained rate of consumption.

That there will be general insistence on the Sept. 10 clause (which has been inserted in third quarter contracts for bars, plates and shapes, as well as for sheets) is indicated by current reports. Buyers who have specified their September quotas with instructions to ship in the last week of that month have met with refusals. The mills propose to ship at their convenience on or after Sept. 10, to protect themselves from the customary carryover tonnage that has resulted from heavy shipping orders in the closing week of a quarter.

Price advances have been announced in cold-rolled strips and sheet bars. The latter product has been raised \$1 a ton to \$33, Youngstown, by a Valley maker, for fourth quarter delivery, and a leading producer of cold-rolled strips has announced an advance, effective immediately, of \$2 to \$4 a ton above recently prevailing prices. Ground shafting was marked up \$2 a ton, effective Aug. 15.

Pending tests of prices announced for fourth quarter, the growing strength of the current market is attested by bids on 25,000 tons of plates, shapes and bars for the Pennsylvania Railroad, which brought out minimum quotations of 1.90c. from Pittsburgh and Ohio mills and 2.10c. from Chicago district producers.

An order for 37,000 tons of 18-in. pipe has been placed for a gas line to run from Fowler, La., to Memphis, Tenn. For an oil line from Oklahoma to Whiting, Ind., for the Sinclair Pipe Line Co., 42,000 tons of 8, 10 and 12-in. pipe will be required.

Structural steel contracts amounting to 53,000 tons include 20,000 tons for a Brooklyn department store and 10,500 tons for Mississippi River barges. At Oakland, Cal., bids are in on 7200 tons of fabricated steel pipe for water mains; alternate bids were taken on 22,000 tons of cast iron pipe.

Unfilled orders of independent sheet mills on Aug. 1 were 550,468 tons, or nearly double the shipments of 278,310 tons in July. The gain in sheet sales in July was 14,455 tons over June, while production fell off 40,000 tons. Sales for the month exceeded shipments by 57,047 tons.

Pittsburgh

Increasing Demand for Steel Encourages Stronger Price Stand on Various Products for Fourth Quarter

PITTSBURGH, Aug. 21.—Steel business continues good, and with productive capacity holding to the high rate of engagement recently attained, steel companies are giving more attention to the consolidation of their gains. In addition to the fact that several other makers have followed the lead of the Youngstown Sheet & Tube Co. in raising fourth quarter sheet prices, the recent advance on cold-finished steel bars has become more general and makers of cold-rolled strips will ask from \$2 to \$4 a ton more for fourth quarter tonnages than they are getting on current shipments. More sheet and cold-rolled strip makers are falling in line with the reduced cash discount plan and makers of semi-finished steel and of bars, plates, shapes, hoops and bands are following the Carnegie Steel Co. in the imposition of charges where there is an extra production cost for special elements such as silicon, carbon, manganese, phosphorus, etc. Taking the market as a whole, the weak spots are few and the desire for prices that will net a fair return is stronger and more general than it has been in a long time.

New business is light in all products except pipe, structural shapes on projects that recently have arisen and plates for river barges, but with consumers enjoying very complete coverage for this quarter any other condition would be unusual. As reflected by specifications, the market is really active and only a few products are not sharing. Bar and sheet specifications are particularly heavy and those for strips, both hot and cold-rolled,

leave little to be desired. One local maker of strips finds this month's releases to have been equal to 90 per cent of capacity, against 75 per cent in July. Tin plate specifications are beginning to falter and some letdown in mill operations appears likely in October.

There is not only a continuance of the urgent demand for seamless pipe for California oil fields, but continued activity in line pipe. One order for

36,000 tons is on mill books and another for 42,000 tons of seamless pipe is in prospect.

In view of the contract provision setting Sept. 10 as the last day on which specifications may be entered against third quarter contracts for bars, plates, shapes and sheets and also because buyers of sheets, including tin mill black plate and cold-rolled strips, have only a little more than a month in which to enjoy the 2 per cent discount for cash payment of invoices, there is a suggestion that these factors possibly are influencing the present and unusual midsummer activity, but there is no evidence that consumers are stocking, and more commonly the activity is ascribed to an unusually well maintained rate of actual consumption. The steel market in the final quarter of the year therefore is not in danger of feeling a liquidating movement and, if it quiets down, it will be a reflection of lessened consumption.

The Pittsburgh valley pig iron market finally has caught the swing of other markets and if no more active in point of sales, it is in point of interest by consumers and in showing a stronger tendency. The scrap market has lost some of its recent tenseness, but supplies still are scant and prices very firm.

Pig Iron.—This market finally has begun to reflect the activity and strength of outside markets, and while actual sales of the past week showed no appreciable increase over those of the week before, inquiries are much more numerous. Basic iron, after several weeks of inactivity, now is being sought by the Allegheny Steel Co., the Edgewater Steel Co., the American Steel Foundries for its Alliance, Ohio, works, and it is understood that the Central Alloy Steel Corporation is finding its own production insufficient for its requirements and is a probable buyer. No specific tonnages are mentioned in these inquiries, but based upon the usual takings, it is believed that fully 20,000 tons will be wanted. Steel companies, which ordinarily have some surplus iron for market, are so heavily engaged and are using so much of their production that there is not the recent eagerness for business. As regular merchant producers are not anxious to sell at current prices, the feeling is that these several inquiries will produce higher prices. Scrap has not only had a steep advance over the past few weeks, but is anything but plentiful at the higher levels. This is believed to be a factor in the revived interest in basic iron. A sale of 1000 tons of basic iron to a Middle interest at \$16, Valley furnace, is reported. The Standard Sanitary Mfg. Co. has entered the market for the third quarter requirements of its several plants and is expected to close before another week passes. No definite tonnage is mentioned, but it is assumed that this company will buy all the iron that is offered at what it considers a reasonable figure. With Lake front furnaces well sold up and no longer actively seeking business in the territory tributary to the Valley furnaces, a tendency toward strength is noted in foundry iron. While on current business, \$16.50, Valley furnace, for No. 2 grade still is being done, producers are trying to secure more on iron for later shipment. One company is quoting \$16.75 for No. 2, \$17 for No. 2X and \$17.50 for No. 1X. A Titusville, Pa., melter recently closed for approximately 1000 tons of foundry iron; Valley fur-

naces which shared in this business were obliged to equalize a lower freight rate from Erie. The Carnegie Steel Co. has taken off the one Isabella furnace it had in blast. The Trumbull-Cliffs furnace, Warren, Ohio, is about to be blown out for repairs and relining.

Prices per gross ton, f.o.b. Valley furnace:	
Basic	\$16.00
Bessemer	17.00
Gray forge	\$16.25 to 16.50
No. 2 foundry	16.50 to 16.75
No. 3 foundry	16.25 to 16.50
Malleable	17.00
Low phos., copper free....	26.50

Freight rate to Pittsburgh or Cleveland district, \$1.76.

Ferroalloys.—The report still is of a good movement on contracts, but a minimum of new business because consumers generally are so well covered by contracts. Prices are unchanged.

Semi-Finished Steel.—Shipments of sheet bars on contracts still are heavy, since sheet and tin mills continue to operate at a high rate and specifications for the finished products are large. Quickening of the operations of strip mills is reflected in an increased movement of billets and slabs. New business in these forms, however, still is light and no negotiations yet have been started for fourth quarter tonnages. The Youngstown Sheet & Tube Co. has named \$33, Youngstown, as its fourth quarter price on sheet bars, and Pittsburgh makers will probably name the same price f.o.b. Pittsburgh. This is an advance of \$1 a ton, and a similar advance in billets and slabs is in prospect. A card of chemical extras covering semi-finished steel has been issued. Wire rods are firm at \$42, base, Pittsburgh or Cleveland. Skelp is moving fairly well on contracts, but there is not much open market activity.

Bars, Plates and Shapes.—Consumers of bars are taking shipments freely against third quarter commitments, and as the mills still are adhering firmly to their intention to cancel tonnages for this quarter not specified by Sept. 10, it begins to look as if there would be much less of a carryover of third quarter business into the final quarter of the year than was true of first and second quarter contracts. As matters have been in the past year or so, a quarterly con-

tract actually has given buyers four months' protection, since it has been possible for buyers to wait until the last day of the last month of a quarterly period before putting in specifications. The mills also are insisting upon specifications by Sept. 10 on shapes and plates, with an idea of cleaning their books of third quarter business as promptly as possible after Oct. 1. Structural lettings in this area continue small, but three local barge builders will share in the award of 92 barges for the Mississippi River Commission, calling for 11,000 tons. Current business is moderate as few buyers are unprotected against their requirements for this quarter. Such new business as is being done in bars and shapes is at 1.90c., base Pittsburgh. Plates also have been sold at that price, but in the gages and sizes competitive with the product of strip and sheet mills even 1.85c., base, has been hard to obtain.

Rails and Track Supplies.—This is usually a quiet period in rails and track fastenings and this year is no exception. Prices show no change, but there is some weakening in the stand of makers for the extra of \$5 a ton on less than carload lots of spikes.

Wire Products.—Business is better than it has been, but is not active and the firmness of prices still stands out as the interesting feature of the situation.

Tubular Goods.—The National Tube Co. has taken an order for 218 miles of 18-in. pipe for gas line to run from the Monroe, La., field to Memphis, Tenn. This means approximately 36,000 tons. Between line pipe business and a continued insistent demand for seamless pipe for oil well work from California and a good demand for the latter for the Seminole, Okla., field, the pipe makers are enjoying comparatively good times. Welded oil country pipe is not moving with much vigor and demand for butt weld pipe is better described as steady than as active. Competition for pipe line business is keen and prices are favorable to buyers, but in other classes the market is firm and the secondary market is reported to be more stable than it was a few months ago. The Sinclair Pipe

Chromium Nickel Vanadium	1.50	4.15
Carbon Vanadium	0.95	3.60

Above prices are for hot-rolled steel bars, forging quality. The ordinary differential for cold-drawn bars is 1c. per lb. higher. For billets 4 x 4 to 10 x 10 in., the price for a gross ton is the net price for bars of the same analysis. For billets under 4 x 4 down to and including 2½ in. squares, the price is \$5 a gross ton above the 4 x 4 billet price.

Slabs with sectional area of 16 in. or over carry the billet price; slabs with sectional area of 12 in. to 16 in. carry a \$5 extra above the billet price and slabs with a sectional area under 12 in. carry the bar price.

Band sizes are 40c. per 100 lb. higher.

Rails

Carbon, 0.30% to 0.40%, base.....	50
Plus differentials for lengths over 18 ft. and for commercial exact lengths. Warehouse discounts on small lots are less than the above.	

Line Co. will build a new oil line from Oklahoma to Whiting, Ind., in connection with a plan to increase its oil delivery capacity to Chicago by 25,000 bbl. daily. The new line will call for 42,000 tons of 8, 10 and 12-in. seamless pipe.

Sheets.—Business of the past week of the American Sheet & Tin Plate Co. was the largest of any similar period since late in 1925, and independent companies appear to be faring quite as well. Mills generally are insisting that tonnages bought on third quarter contracts not specified by Sept. 10 next will be cancelled, and one important maker is considering the setting of Sept. 3 as the deadline. It is not clear whether this is responsible for the activity, or that buyers want some protection against the lower rate of discount that is to become effective Oct. 1, but the fact remains that business is of unusual proportions for this time of the year. On current business, recent prices are ruling. The American Sheet & Tin Plate Co. has named 2.75c., base Pittsburgh, on black sheets, 3.60c., base, on galvanized, and 2c., base, on blue annealed as its fourth quarter prices. This company also has announced a change of terms to ½ of 1 per cent for cash in 10 days from date of invoice, effective Sept. 30 next.

Tin Plate.—Specifications for tin plate are lighter, and while makers are well supplied with business for the next 30 days, it is probable that there will be open mill capacity before the end of September. October requirements usually are light and there is no prospect that this year will be an exception. No sharp falling off in mill operations is likely, as there will be some production in October and more in November against early 1929 requirements.

Cold-Finished Steel Bars and Shafting.—Business is satisfactory to most makers, but they would like to be get-

ting more money for the product. Most of the orders on the books are at 2.10c., base Pittsburgh, and there has been enough coverage of buyers at that price to make difficult the obtaining of the higher price recently announced. Ground shafting prices have been advanced \$2 a ton, effective from Aug. 15, now being quoted at 3.50c., base mill, for 1½ in.; 3c. for 1 3/16 in. to 1½ in.; 2.85c. for 1 9/16 in. to 1½ in.; 2.70c. for 1 15/16 in. to 2½ in., and 2.55c. for 2 15/16 in. to 7 in.

Hot-Rolled Flats.—There is not only an active demand in the shape of specifications against contracts, but the trend of prices is toward increased firmness. Nothing yet has been said as to fourth quarter contract prices, and strictly new business is not of sufficient proportions to afford much of a test, but a restoration of what had been regarded as the regular market schedules, or 1.90c., base, for wide, 2.10c., base, for intermediate widths, and 2.20c., base, for narrow stock appears to be the aim of most producers.

Cold-Rolled Strips.—A leading producer has announced a base price of 2.85c., effective immediately. It also has announced a new card of extras dated Aug. 21, which incorporates changes in the extras for quantities of less than 3 tons of a size. This company also has opened its books for fourth quarter business. Other producers are expected to follow its lead, which means an advance of \$2 to \$4 a ton from prices recently prevailing, and abolishes the former method of making the base price apply on 1 to 3 tons of a size, with a decrease of 25c. per 100 lb. for lots of 3 tons or more, which caused a good deal of confusion. Cold-rolled strip business maintains its recent improvement.

Coke and Coal.—A steel company which recently took off the market much of the spot supply of beehive furnace coke has repeated the operation on a smaller scale, and the result is that spot offerings remain scant enough to keep prices very firm. General demand for furnace coke is moderate and no exceptional activity is noted in spot foundry coke. Supplies of the latter are ample. The coal market continues dull, except for household sizes, and prices generally are easy.

Bolts, Nuts and Rivets.—There has been some improvement in demand in the past week, but the market is active only in a comparative sense. Prices are held with a good deal of firmness.

Old Material.—There is a somewhat calmer tone to the market this week, as all consumers seem to have secured some supplies recently, and with increased mill operations there is naturally increased supply of mill scrap. Dealers still are buying, and, as offerings are moderate, prices are quite as firm as they have been. The advance, however, appears to have been checked. Dealers still report success in getting heavy melting steel for one

point in the district at \$15, but at other points \$15.50 is the ruling figure, and on fresh sales \$16 is as low as any dealer would be interested.

Prices per gross ton delivered consumers' yards in Pittsburgh and points taking the Pittsburgh district freight rate:

Basic Open-Hearth Grades:

Heavy melting steel.....	\$15.00 to \$16.00
Scrap rails	15.00 to 15.50
Compressed sheet steel.....	14.75 to 15.25
Bundled sheets, sides and ends	13.75 to 14.25
Cast iron carwheels.....	15.00 to 15.50
Sheet bar crops, ordinary.....	15.50 to 16.00
Heavy breakable cast.....	12.00 to 12.50
No. 2 railroad wrought....	15.00 to 16.00
Heavy steel axle turnings.....	14.00 to 14.50
Machine shop turnings....	16.00 to 10.50

Acid Open-Hearth Grades:

Railr. knuckles and couplers	16.00 to 16.50
Railr. coil and leaf springs	16.00 to 16.50
Rolled steel wheels.....	16.00 to 16.50
Low phos. billet and bloom ends	19.00 to 19.50
Low phos., mill plate.....	17.50 to 18.00
Low phos., light grade.....	16.50 to 17.00
Low phos. sheet bar crops.....	17.50 to 18.00
Hvy. steel axle turnings..	14.00 to 14.50

Electric Furnace Grades:

Low phos. punchings.....	16.00 to 16.50
Hvy. steel axle turnings..	14.00 to 14.50

Blast Furnace Grades:

Short shov'l'g steel turnings	11.00 to 11.50
Short mixed borings and turnings	11.00 to 11.50
Cast iron borings.....	11.00 to 11.50
No. 2 busheling.....	10.00 to 10.50

Rolling Mill Grades:

Steel car axles	18.50 to 19.00
No. 1 railroad wrought....	12.00 to 12.50
Sheet bar crops.....	16.50 to 17.00

Cupola Grades:

No. 1 cast.....	14.50 to 15.00
Rails 3 ft. and under.....	16.00 to 16.50

A reduction in freight rates on spelter between Indiana points and sources of supply in Arkansas has been announced by the Indianapolis Chamber of Commerce. The 34½c. rate to Indianapolis has been reduced to 25½c. and corresponding reductions have been made for all points in the State, placing Indiana consumers on the same basis as Chicago.

Employment in Worcester, Mass., industries has shown improvement. According to figures furnished by the 42 plants which report to the Worcester Safety Council in its lost-time accident contest, the average number of employees in June was 23,377. In June, 1927, the same companies reported an average of 20,637 workers. Worcester outbound shipments in June this year were 33,398 cars against 30,540 cars in June, 1927. In July the total was 30,071 cars against 27,120 a year previous.

The Lehigh Structural Steel Co., Allentown, Pa., has rounded out its group insurance program by the purchase of group health and non-occupational accident insurance. According to salary classification, subscribing employees will be paid \$10, \$20 or \$30 a week when unable to work due to sickness from any cause, or injury received while off duty. During this time insured employees are offered the advantages of a visiting nurse service and a health advisory bureau.

Chicago

Steel Business Sufficient to Sustain 75 Per Cent Output— 50,000 Tons of Foundry Pig Iron Sold

CHICAGO, Aug. 21.—Ingot operations in this district remain at 75 per cent of capacity and steel mills are making use of 25 of a total of 36 blast furnaces. Bar mill capacity is heavily engaged, but in plates and structurals not over 75 per cent of possible output is being used. Steel orders are numerous but individually small and buying is at close range, so that operators are finding difficulty in arranging rolling schedules, particularly in the last days of each week.

Purchases totaling 15,000 tons of standard-section rails closely follow smaller orders in recent weeks. This business has not only served to raise rail mill production but to sustain the higher rate through this week and give promise of an equal output in the next seven days.

Sheet mills, handicapped by hot weather, have speeded to 85 per cent of capacity and even at that rate orders are piling up faster than shipments can be made.

Producers of wire products are finding stocks low and out of balance in view of the prospects for an active fall trade. This situation is being met by an advance of two to three points in mill output and readjustment of production in various departments.

The trend of prices is in an upward direction. Cold-rolled bars have been advanced to 2.20c. per lb., Chicago, and blue annealed sheets are being quoted for fourth quarter at 2.10c. for widths under 45 in. and at 2.20c. for 45 in. and over.

Sept. 10 has been set as the dead line for specifications against orders for plates, shapes and bars at third quarter quotations of 2c. Producers are making a stand for 2.10c. per lb. for these commodities for fourth quarter.

Pig Iron.—Sales of Northern foundry iron for the week total close to 50,000 tons. Individual orders are not as large as in recent weeks, but buyers over a wider territory and in a greater variety of industries are using larger quantities, and appear better able to judge future requirements. Price advances announced to the east of Chicago are having some influence on activity and strength in this market. In some cases buyers who have made recent purchases are rechecking their requirements with the thought of taking full advantage of present prices. In the meantime, local producers are sending out quotations for immediate acceptance. Chicago furnace stocks are shrinking rapidly and are in unsatisfactory balance. It is considered probable here that a merchant stack will be blown in at an early date. Shipments of Northern foundry iron in the 21 days of August are well ahead of the corresponding periods in either June or July of this year.

Prices per gross ton at Chicago:

N'th'n No. 2 fdy., sil. 1.75 to 2.25..	\$17.50
N'th'n No. 1 fdy., sil. 2.25 to 2.75..	18.00
Malleable, not over 2.25 sil.....	17.50
High phosphorus	17.50
Lake Super. charcoal, sil. 1.50.....	27.04
So'th'n No. 2 fdy. (all rail).....	21.51
So'th'n No. 2 (barge and rail).....	21.01
Low phos., sil. 1 to 2, copper free	\$28.50 to 29.00
Silvery, sil. 8 per cent.....	29.79
Bess. ferrosilicon, 14-15%.....	46.79

Prices are delivered consumers' yards except on Northern foundry, high phosphorus and malleable, which are f.o.b. local furnace, not including an average switching charge of 61c. per gross ton.

Ferroalloys.—Specifications against last half contracts for ferromanganese are in larger total volume. New business is quiet at \$105, seaboard. Buyers are showing little interest in spiegeleisen, which is being quoted at \$33, Hazard, Pa., for carloads of the 19 to 21 per cent grade.

Prices delivered Chicago: 80 per cent ferromanganese, \$112.56; 50 per cent ferrosilicon, \$83.50 to \$87.50; spiegeleisen, 19 to 21 per cent, \$40.76.

Plates.—Plate mill engagement in this district continues to hold at a shade above 70 per cent of capacity, in spite of the fact that car shop operations are at low ebb; also there is an increasing use of special shapes, which makes the call for narrow plates from fabricators much less urgent than formerly. Welded gas and oil pipe have taken up part of the slack, and miscellaneous uses for plates have grown to larger proportions. The Texas & Pacific has ordered 3000 tons of tankage material from an Eastern producer. Oil storage projects are being shaped, but definite inquiry is lacking in this market. The Chesapeake & Ohio has closed for 500 gondola cars. The Illinois Traction System will take figures on 100 to 200 50-ton gondola cars and the Great Northern will buy about 6000 tons of steel for a purpose not definitely stated. The Sinclair Pipe Line Co., a joint subsidiary of the Sinclair Consolidated Oil Corporation and the Standard Oil Co. of Indiana, has approved a project that calls for 65,000 tons of steel pipe. It involves a 360-mile line of 8, 10 and 12-in. oil pipe, which will increase pipe line delivery into Chicago by 25,000 bbl. daily. Prices for plates at Chicago are firmer at 2c. per lb. Several small lots have been taken at 2.10c. for delivery in the fourth quarter. Deliveries range from two to three weeks.

Mill prices on plates, per lb.: 2c. base Chicago.

Structural Material.—New structural orders during the last week were confined largely to bridge work. The Mount Vernon Bridge Co. will furnish 4300 tons for a bridge in Louisiana and two bridges in Illinois, calling for 1800 tons. The Rand Building, Minneapolis, requiring 3000 tons, was taken by a Minneapolis shop. Reports that building construc-

tion in Chicago for the first seven months was 38 per cent above the corresponding period a year ago are reflected in the rate at which local shops are engaged. The distribution of orders has not been wholly to the liking of all fabricators, but with the rapid erection common these days it has become necessary for the successful bidder to farm out parts of the larger awards to competing shops. In this way, promised deliveries are met and the rate of shop engagement is quite uniform. In the Northwest and in the West, fabricators are finding orders rather spotty, with the result that some shops are unusually busy while others are complaining because of lack of work. Fresh inquiry includes 1000 tons for the First Regiment Armory, Chicago, and 1500 tons for the Camp Building, Milwaukee. Bids taken on large inquiries at Chicago show prices to be \$6 to \$8 a ton above recent levels. Though the price trend is upward, net returns to fabricators are said to be still extremely narrow. Competition on small jobs is keen and prices on this class of work show no improvement. Chicago producers have in mind naming 2.10c. on structural material for fourth quarter delivery.

Mill prices on plain material, per lb.: 2c., base, Chicago.

Bars.—Shipments of soft steel bars in the first two weeks of August were well ahead of the corresponding period in July. The automotive industry continues the heaviest user. Some promise is given that this pace will continue in that two of the foremost automobile builders are maintaining August production schedules which will establish monthly records for all time. Mild steel bars are steady at 2c., Chicago, for delivery to the end of September. The fourth quarter prices, which are now named at 2.10c., have been used on a few scattered sales. Some unsettling in prices is noted in forging bars, which are reaching this territory from the East. Iron bars are quiet but prices are firm at 2c., Chicago. Shipments of alloy bars remain steady at 80 per cent of local mill capacity. Prices and alloy differentials are holding. Rail steel bar mills have lengthened hours of operation to meet in part a heavier demand and to build up fence post stock, which is small in view of the fact that the fall demand is close at hand. Bed manufacturers are finding need for larger quantities and barn equipment makers show no signs of lessening their pace. Stocks in the hands of users are small and most orders are for immediate delivery. Prices are firm at 1.85c., Chicago Heights.

Mill prices per lb.: Soft steel bars, 2c., base, Chicago; common bar iron, 2c., base, Chicago; rail steel bars, 1.85c., base, Chicago Heights mill.

Sheets.—Warm weather is checking hot mill output, which is averaging close to 85 per cent of capacity. In the meantime, orders continue to pile up and deliveries are lengthening. For blue annealed sheets for fourth quarter, Chicago producers name

2.10c., mill, for widths under 45 in., and 2.20c. for sheets 45 in. and wider. An extra of 10c. per 100 lb. is being added to quotations on all grades for orders that range from 50 to 100 tons.

Base prices per lb., deliv'd from mill in Chicago: No. 24 black sheets, 2.80c. to 2.90c.; No. 24 galv., 3.65c. to 3.75c.; No. 10 blue ann'l'd, 2.15c. to 2.25c. Deliv'd prices at other Western points are equal to the freight from Gary plus the mill prices, which are 5c. per 100 lb. lower than Ch'go deliv'd prices.

Rails and Track Supplies.—Two Western railroads have ordered 15,000 tons of standard-section rails and 7500 tons of track supplies. One purchase is by a railroad which usually buys at this time and the other came from a road that bought lightly in the spring and needs additional rails for this year's laying. The advance reported a week ago in rail mill operations is holding.

Prices f.o.b. mill, per gross ton: Standard-section open-hearth and Bess. rails, \$43; light rails, rolled from billets, \$36. Per lb.: Standard railroad spikes, 2.80c.; track bolts with square nuts, 3.80c.; steel tie plates, 2.15c.; angle bars, 2.75c.

Cast Iron Pipe.—The United States Cast Iron Pipe & Foundry Co. is low bidder at \$41.90, delivered, on 1920 tons of 8 and 12-in. class B pipe for Chicago. The freight rate from Birmingham to Chicago is \$8.20. Taken as a whole, this market is quiet.

Prices per net ton, deliv'd Chicago: Water pipe, 6-in. and over, \$42.20 to \$43.20; 4-in., \$46.20 to \$47.20; Class A and gas pipe, \$4 extra.

Reinforcing Bars.—Greater activity marks this commodity. Awards are well scattered over the entire territory and prices are firm, except to the south. Indiana and southern Illinois dealers have reached into central Illinois and have taken business below the levels being maintained in and near Chicago. Locally 2.30c. and 2c., base warehouse, respectively, are the ruling quotations on billet steel and rail steel bars, these prices having been re-established after a break about 10 days ago. Architects remain busy, and dealers are awaiting plans on several heavy-tonnage apartment projects. Plans have not been prepared on the Apparel Mart, Chicago, and the tonnage of reinforcing bars required is in doubt. New awards and fresh inquiries are shown on page 498.

Warehouse Prices, f.o.b. Chicago	
Base per Lb.	
Plates and structural shapes.....	3.10c.

Cement c't'd nails, base per keg.....	3.10

Old Material.—Tendencies in the local scrap market are varied. Heavy melting steel has brought \$13 a gross ton, which is 25c. below prices paid on recent heavy purchases. On the other hand, numerous other grades are advancing in price. Steel foundry grades are active. Short rails and steel angle bars are scarce.

Prices deliv'd Chicago district consumers:
Per Gross Ton

Basic Open-Hearth Grades:	
Heavy melting steel.....	\$12.75 to \$13.25
Shoveling steel	12.75 to 13.25
Frogs, switches and guards, cut apart, and misc. rails	14.00 to 14.50
Hydraul. compressed sheets	11.25 to 11.75
Drop forge flashings.....	9.50 to 10.00
Forg'd, cast and r'l'd steel carwheels	16.00 to 16.50
Railr'd tires, charg. box size	16.00 to 16.50
Railr'd leaf springs cut apart	16.00 to 16.50

Acid Open-Hearth Grades:	
Steel couplers and knuckles	14.25 to 14.75
Coil springs	16.50 to 17.00

Electric Furnace Grades:	
Axle turnings	12.75 to 13.25
Low phos. punchings.....	14.50 to 15.00
Low phos. plate, 12 in. and under	14.50 to 15.00

Blast Furnace Grades:	
Axle turnings	9.50 to 10.00
Cast iron borings.....	9.25 to 9.75
Short shoveling turnings..	9.25 to 9.75
Machine shop turnings...	6.50 to 7.00

Rolling Mill Grades:	
Iron rails	14.00 to 14.50
Rerolling rails	15.50 to 16.00

Cupola Grades:	
Steel rails less than 3 ft..	15.75 to 16.25
Angle bars, steel.....	15.25 to 15.75
Cast iron carwheels.....	12.75 to 13.00

Malleable Grades:	
Railroad	13.00 to 13.50
Agricultural	11.50 to 12.00

Miscellaneous:	
*Relay'g rails, 56 to 60 lb.	23.00 to 25.00
*Relay'g rails, 65 lb. and heav.	26.00 to 31.00

Per Net Ton	
Rolling Mill Grades:	
Iron angles and splice bars	13.50 to 14.00
Iron arch bars and transoms	20.00 to 20.50
Iron car axles	24.00 to 24.50
Steel car axles	15.75 to 16.25
No. 1 railroad wrought..	11.25 to 11.75
No. 2 railroad wrought..	11.50 to 12.00
No. 1 busheling	10.00 to 10.50
No. 2 busheling	5.75 to 6.25
Locomotive tires, smooth..	12.00 to 12.50
Pipes and flues	8.00 to 8.50

Cupola Grades:	
No. 1 machinery cast....	14.00 to 14.50
No. 1 railroad cast.....	13.00 to 13.50
No. 1 agricultural cast....	12.50 to 13.00
Stove plate	10.75 to 11.25
Grate bars	12.00 to 12.50
Brake shoes	10.00 to 10.50

*Relaying rails, including angle bars to match, are quoted f.o.b. dealers' yards.

Cold-Finished Bars.—Following closely the announcement of higher prices in the East, local producers have named 2.20c. per lb., Chicago, to rule on quotations for all orders that can be delivered before the end of the third quarter. Books have not been opened for the final quarter.

Wire Products.—Producers of wire and wire products look with favor on the substantial volume of business that is reaching them in August, which is usually a dull month, and they are pinning their faith on the outlook for crops and a fair degree of assurance that fall trade will be heavy. Reports from the country, as a whole, indicate that crops will be larger and prices higher than in 1927.

Dealers in rural districts are finding business dull, and this situation is reflected back to the jobbers. Stocks in the hands of distributors are small, and orders to mills are merely to fill in for immediate requirements. On the other hand, the general level of activity in the manufacturing trade is high, especially in the Detroit and Cleveland territories. The demand for bale ties is unusually active when it is considered that the use for this commodity is steadily decreasing. The increased rate of nail shipments noticed 10 days ago has continued. Wire mills, in order to build stocks, have raised operations a point or two above the recent 60 per cent rate. Producers believe that they have enough orders in sight to make certain that the summer of 1928 will be the best mid-year season since 1922.

Coke.—Prices for by-product foundry coke are steady and deliveries are running a shade heavier than in July.

Bolts, Nuts and Rivets.—Output by producers of these commodities remains between 60 and 65 per cent of capacity. Specifications have grown heavier from manufacturers of agricultural machinery.

New Extras Announced by Carnegie Steel Co.

The Carnegie Steel Co. has published, under date of Aug. 1, two new cards, one giving the classification of extras for size, chemical specifications and quality for semi-finished steel and the other giving the extras for chemical specifications and quality of structural shapes, plates, bars, small shapes, hoops and bands.

Except that the extra for copper content in semi-finished steel up to 0.20 minimum is \$3 per gross ton against \$2 per net ton on finished products and that the new semi-finished card extras are expressed in dollars per gross ton and those for finished products in cents per pound, the extras are the same as those published in THE IRON AGE of Aug. 9, last.

Size extras for blooms, billets and slabs are:

Squares under 4 x 4 in. to 1½ x 1½ in., inclusive, or rectangular sections of equivalent areas not less than 3-in. thick, \$1 per gross ton.

4 x 4 in. to under 10 x 10 in., or equivalent area, no extras.

10 x 10 in. to under 14 x 14 in. or equivalent area, \$2 extra.

14 x 14 in. to under 16 x 16 in. or equivalent area, \$4 extra.

16 x 16 in. to under 20 x 20 in., or equivalent area, \$6 extra.

20 x 20 in. and over or equivalent area, \$8 extra.

Weight per piece when ordered 12,000 lb. or over, \$10 extra. (This shall not apply when product of ingot is accepted).

Production of bituminous coal in the United States up to Aug. 11 is reported by the Bureau of Mines at 285,098,000 net tons. This compares with 325,673,000 tons for the corresponding period in 1927 and 324,847,000 tons in 1926.

Philadelphia

Pennsylvania Railroad Bids on Plates, Shapes and Bars Range from 1.90c. to 2.10c., Mill

PHILADELPHIA, Aug. 21.—Bids opened today by the Pennsylvania Railroad on 25,000 tons of plates, shapes and bars, were watched with interest by representatives of steel producers with a view to determining the attitude of various companies on fourth quarter prices. The railroad did not specify when it would take delivery, but it was assumed that, as its inquiry came out in the middle of the quarter, instead of at the beginning, specifications would be spread over the rest of the year. Eastern mills, including those in the Pittsburgh and Ohio districts, quoted 1.90c., mill, and Chicago producers quoted 2.10c., with the single exception that the Republic Iron & Steel Co. quoted 2c. on bars. Some companies stated that their quotations would hold good for specification only until Sept. 30, while others, conspicuously the Carnegie Steel Co. and the Bethlehem Steel Co., made no restriction. A few producers gave Dec. 31 as the final date on which specifications would be accepted.

The price situation is unchanged on orders for early shipment, except on shapes, which are slightly firmer. Present activity is confined almost entirely to specifications against third quarter contracts. The announced advances on plates, shapes, bars, black and galvanized sheets for fourth quarter by some mills will no doubt be followed by Eastern mills.

Pig Iron.—Foundry iron buying is still confined to lots of 100 tons or less. The quotation of \$19.50 per ton, furnace, is firmer, and concession from this base is not considered so likely today as a week or two ago. The Coatesville Boiler Works, Coatesville, Pa., is in the market for about 100 tons of No. 2X and the Baltimore & Ohio Railroad is inquiring for a carload of high manganese foundry. The J. L. Mott Co., Trenton, N. J., has closed with a nearby furnace on about 100 tons of No. 2 foundry. Demand for low phosphorus has improved and prices are quite firm. The Lorain Steel Co., Johnstown, Pa., is inquiring for 1500 to 2000 tons of low phosphorus iron, copper bearing being acceptable. Nearby users of basic iron are well covered for the present.

Prices per gross ton at Philadelphia:

East. Pa. No. 2, 1.75 to 2.25 sil.	\$20.26
East. Pa. No. 2X, 2.25 to 2.75 sil.	20.76
East. Pa. No. 1X.	21.26
Basic (del'd east. Pa.)	\$18.75 to 19.25
Gray forge	19.75 to 20.25
Malleable	21.00 to 21.50
Stand. low phos. (f.o.b. N. Y. State furnace)	22.00 to 23.00
Cop. b'r'g low phos. (f.o.b. furnace)	23.00 to 23.50
Va. No. 2 plain, 1.75 to 2.25 sil.	24.54
Va. No. 2X, 2.25 to 2.75 sil.	25.04

Prices, except as specified otherwise, are deliv'd Philadelphia. Freight rates: 76c. to \$1.64 from eastern Pennsylvania furnaces; \$4.54 from Virginia furnaces.

Ferromanganese.—Activity is almost entirely in requisitions against last half contracts, consumers evidently not needing any tonnage in addition to their commitments. The price continues at \$105 per ton, sea-board.

Bars.—Most mills are well booked with business and able to maintain a fair rate of operation. Quotations for current delivery are 1.85c. to 1.90c., Pittsburgh, or 2.17c. to 2.22c., Philadelphia, and 2c., Pittsburgh, or 2.32c., Philadelphia, has been named as the fourth quarter price.

Plates.—Shipments are principally of contract specifications, but there is a fair tonnage of such business and

improvement in small orders for prompt shipment is expected after Labor Day. Quotations continue at 2c. to 2.05c., Coatesville, or 2.10c. to 2.15c., Philadelphia; for early delivery and 2.15c., Coatesville, or 2.25c., Philadelphia, is considered as a possibility for fourth quarter business.

Shapes.—Fabricators are well engaged and have a good tonnage of desirable contracts in prospect before the end of the year. This is reflected in a better demand and firmer prices. The producer at Pencoyd, Pa., which has been quoting 1.95c. to 2c., Pencoyd, or 2.01c. to 2.06c., Philadelphia, has begun to ask 2c. to 2.05c., Pencoyd, or 2.06c. to 2.11c., Philadelphia. The market does not show a full \$1 a ton advance, however, as preferred buyers are reported as still able to obtain 1.95c., Pencoyd, on desirable business. On small lots of shapes for prompt shipment, 2c., Bethlehem, or 2.13c., Philadelphia, occasionally applies.

Sheets.—Consumers are well booked with business, particularly the automobile body builders and a local radio

Warehouse Prices, f.o.b. Philadelphia

	Base per Lb.
Plates, ¼-in. and heavier	2.50c. to 2.60c.
Plates, ⅝-in.	2.80c. to 3.00c.
Structural shapes	2.40c. to 2.60c.
Soft steel bars, small shapes, iron bars (except bands)	2.70c.
Round-edge iron	3.50c.
Round-edge steel, iron finished 1½ x 1½ in.	3.50c.
Round-edge steel, planished	4.30c.
Reinforc. steel bars, sq. twisted and deform.	2.50c. to 3.00c.
Cold-fin. steel, rounds and hex.	3.35c.

*For 50 bundles or more; 10 to 49 bun., 4.10c. base; 1 to 9 bun., 4.35c. base.
†For 50 bundles or more; 10 to 49 bun., 4.95c. base; 1 to 9 bun., 5.30c. base.

manufacturer, but in most cases, users are well covered and are not expected to show much interest in fourth quarter contracts until the end of next month. Mills generally are seeking a \$2 to \$4 advance on black and galvanized sheets for last quarter delivery, asking 2.75c., base Pittsburgh, for black and 3.60c. for galvanized. Present quotations for early shipment are 2.65c. on black and 3.40c., Pittsburgh, on galvanized. Blue annealed prices are being fairly well maintained at 2c., Pittsburgh, or 2.32c., Philadelphia, for 45 in. and narrower and 2.10c., base Pittsburgh, on wider than 45 in. Occasional concessions from 2c., Pittsburgh, have been made to preferred buyers.

Warehouse Business.—Buying is light and at the present rate the total will probably be smaller for this month than in July.

Imports.—In the week ended Aug. 18, arrivals of pig iron totaled 2614 gross tons, of which 2500 tons was from the United Kingdom, 59 tons from Sweden and 55 tons from Norway. Ore arrivals totaled 610 tons from Portuguese Africa. In steel products, 262 tons of structural shapes, 61 tons of steel bars and four tons of bands came from Belgium and 103 tons of structural shapes from Germany.

Old Material.—The week's business was featured by the purchase of upward of 10,000 tons of heavy melting steel by the Bethlehem Steel Co. for shipment to Bethlehem. The price was \$13 a ton, which also applied on the last previous purchase by this company. All grades show more firmness and in a few instances prices have advanced on recent sales. Bundled sheets are 50c. a ton higher, based on \$11 a ton paid by a Harrisburg, Pa., consumer, and yard steel is quotable at a similar 50c. a ton advance as a result of a purchase at \$11.50 per ton, delivered Harrisburg. Specification pipe has been bought by a user at Columbia, Pa., at \$13 per ton, delivered, an increase of 50c.

Prices per gross ton delivered consumers' yards, Philadelphia district:

No. 1 heavy melting steel.	\$13.00
Scrap T rails	12.50
No. 2 heavy melting steel	\$11.00 to 11.50
No. 1 railroad wrought	13.50 to 14.50
Bundled sheets (for steel works)	10.50
Machine shop turnings (for steel works)	10.50
Heavy axle turnings (or equiv.)	12.00 to 13.00
Cast borings (for steel works and roll. mill)	10.50
Heavy breakable cast (for steel works)	15.00 to 15.50
Railroad grate bars	11.00 to 11.50
Stove plate (for steel works)	11.00 to 11.50
No. 1 low phos., hvy., 0.04% and under	17.50 to 18.00
Couplers and knuckles	14.50 to 15.00
Rolled steel wheels	14.50 to 15.00
No. 1 blast f'nace scrap	9.50 to 10.00
Wrot. iron and soft steel pipes and tubes (new specific.)	12.50 to 13.00
Shafting	16.50 to 17.00
Steel axles	19.00 to 20.00
No. 1 forge fire	11.00
Cast iron carwheels	15.50 to 15.75
No. 1 cast	15.50 to 16.00
Cast borings (for chem. plant)	14.50 to 15.00
Steel rails for rolling	14.50 to 15.00

August Steel Orders Exceeding Those of July—Pig Iron Sales in Good Volume

NEW YORK, Aug. 21.—Sales of pig iron in this territory continue in good volume, having totaled 13,000 tons for the week. The General Electric Co. inquiry for 5000 tons is still pending, and a number of other sizable tonnages have come out for figures. The H. B. Smith Co., Westfield, Mass., is in the market for 5000 tons of foundry iron, and the General Fire Extinguisher Co., Providence, R. I., is asking for prices on 2300 tons of No. 1X and No. 2X. The New York Air Brake Co., Watertown, N. Y., is inquiring for 200 tons of low phosphorus and has requested figures on an unspecified tonnage of No. 2 plain. A large proportion of the business placed last week was in relatively small lots. The smaller melters, although they are not covering for fourth quarter to the same extent as some of the large buyers, are placing considerable spot tonnage. Notable among orders placed was 625 tons of Dutch foundry iron, bought by the American Hardware Corporation, New Britain, Conn. Incidentally, it is reported that a cargo of Dutch iron will be afloat for delivery at Bridgeport, Conn., before the end of August. The entire shipment is said to have been sold. The American Car & Foundry Co., which was in the market for 300 tons for Berwick, Pa., has closed for a larger tonnage of various grades. A scarcity of barges resulting from a heavy movement of wheat has interfered with water shipments of pig iron from Buffalo. Furnace stocks at Buffalo have been reduced materially, it is said, and two producers have raised quotations on foundry iron to \$16.50, base. Higher prices have not yet been reflected in sales, however. The Adrian furnace, Dubois, Pa., was lighted Aug. 20.

Prices per gross ton, delivered New York district:

Buffalo No. 2 fdy., sil. 1.75 to 2.25	\$20.91 to \$21.41
*Buf. No. 2, del'd east. N. J.	19.28 to 19.78
No. 2, del'd east. N. J. tidewater	19.01 to 19.51
East. Pa. No. 2 fdy., sil. 1.75 to 2.25	19.89 to 21.52
East. Pa. No. 2X fdy., sil. 2.25 to 2.75	20.39 to 22.02
East. Pa. No. 1X fdy., sil. 2.75 to 3.25	20.89 to 22.52

Freight rates: \$4.91 from Buffalo, \$1.39 to \$2.52 from eastern Pennsylvania.

*Price delivered to New Jersey cities having rate of \$3.28 a ton from Buffalo.

Steel Pipe.—For a gas pipe line from Fowler, La., to Memphis, Tenn., 37,000 tons of steel has been placed. The line includes 210 miles of 18-in. pipe and eight miles of another size for river crossings.

Plates, Shapes and Bars.—Steel companies which provided in their third quarter contracts that all specifications for delivery during the quarter shall be entered on or before Sept. 10, are now engaged in checking up on their customers to see that the provision is complied with. One or two companies specified Sept. 15 as the

closing date for specifications, and a few made no change whatever in their contracts, which presumably means that such companies will be obliged to take specifications up to the end of September. However, it appears that the bulk of the tonnage of these

No. 30.....	5.40c. to 5.60c.

*No. 28 and lighter, 36 in. wide, 20c. higher per 100 lb.

products under contract is covered by the Sept. 10 or Sept. 15 clause, and as the provision is a new one its effect on incoming business in the early part of September will be watched with interest. In a few instances buyers have already specified their September quotas with instructions to ship the last week of September; the mills receiving these requests, however, have declined to accept such shipping instructions and intend to ship at their convenience on or after Sept. 10. The object of the clause is plain—it is to prevent the carryover tonnage from one quarter to another which has resulted from heavy specifying in the final week or two of a quarter, particularly when an advance in price was in prospect. The mills hope to clear their books of third quarter tonnage by Oct. 1 or shortly thereafter, and to make the higher prices announced for the last quarter really effective from the first day of the new period. Just how successful the mills will be in establishing a \$2 advance for the last three months remains to be seen, but it is certain that the groundwork for an advance was never better prepared. Not all mills have announced fourth quarter prices; some apparently are waiting for the effect on buyers of the advances named by a few of the larger interests. Meanwhile, the steel trade is encouraged by the steady gain in specifications and new business, the total for the three weeks of August being well ahead of that for the corresponding period in July. On current business, prices are unchanged. Bars are being sold at 1.90c., Pittsburgh, to consumers and jobbers not covered by 1.85c., contracts, but plates and shapes are to be had at 2c., Eastern basing points, with 2.05c. applying on some small lots. Post & McCord have been awarded the steel contract for an addition to the Abraham & Straus department store, Brooklyn, which will take 20,000 tons. Plans for the Reynolds Tower Building, Lexington Avenue and Forty-second Street, which would take 17,000 tons of steel, may be abandoned.

Mill prices per lb., deliv'd New York: Soft steel bars, 2.19c. to 2.24c.; plates, 2.12½c. to 2.22½c.; struct. shapes, 2.14½c. to 2.19½c.; bar iron, 2.14c.

Sheets.—Almost without exception, makers of sheets have adopted a higher price schedule for fourth quarter. Blue annealed sheets remain at 2c., base, but there is an extra of 10c. per 100 lb. for widths exceeding 45 in., whereas the former dividing line was 40 in. Black sheets are being quoted at 2.75c. and galvanized at 3.60c. Many of the sheet companies inserted a clause in their third quarter contracts providing for final specifications to be in by Sept. 10, and it is stated that this provision will be rigidly enforced.

Warehouse Business.—Present activity compares favorably with that of the same period of July, so that the month's business is expected to reach a fair total. Sheet prices are

slightly firmer, probably reflecting announcements of higher mill prices for fourth quarter.

Old Material.—The strong undertone of a week ago has developed into an upward movement of prices affecting practically all grades of scrap. Brokers are paying higher prices, and in some instances are offering the full amounts received on their contracts. Yard steel is being bought at from \$10.50 per ton delivered Pottsville, Pa., to \$11.50 per ton, delivered Harrisburg, Pa. Steel mill stove plate is quoted by brokers at \$11 to \$11.50 per ton, delivered. The minimum price paid for specification pipe today is \$12.50 per ton, delivered Columbia, Pa. Within the past week the Bethlehem Steel Co. closed on more than 10,000 tons of No. 1 heavy melting steel for Bethlehem, at the previous purchase price of \$13 per ton. This would justify a buying price New York of \$9.85 per ton, but some brokers here are offering \$10 and as much as \$10.45 per ton for No. 1 steel to go to western Pennsylvania, delivering to Butler, Pa., and Weirton, W. Va., at \$15.30 to \$15.75 per ton.

Dealers' buying prices per gross ton, f.o.b. New York:

No. 1 heavy melting steel.	\$9.85 to \$10.25
Heavy melting steel (yard)	6.75 to 7.75
No. 1 hvy. breakable cast.	11.25 to 12.00
Stove plate (steel works)...	7.25 to 7.75
Locomotive grate bars....	7.25 to 7.75
Machine shop turnings....	6.25 to 6.50
Short shoveling turnings..	6.25 to 6.50
Cast borings (blast furn. or steel works).....	6.00 to 6.50
Mixed borings and turnings	6.00 to 6.50
Steel car axles.....	15.00 to 15.50
Iron car axles.....	23.50 to 24.00
Iron and steel pipe (1 in. dia., not under 2 ft. long)	8.75
Forge fire	6.50 to 6.75
No. 1 railroad wrought....	9.00 to 9.50
No. 1 yard wrot., long....	7.50 to 8.00
Rails for rolling.....	10.00 to 10.50
Cast iron car wheels.....	11.00 to 12.00
Stove plate (foundry)....	8.75 to 9.00
Malleable cast (railroad)...	10.00
Cast borings (chemical)...	10.75 to 11.25

Prices per gross ton, deliv'd local foundries:

No. 1 machy. cast.....	\$14.50 to \$15.50
No. 1 hvy. cast (columns, bldg. materials, etc.).	
cupola size.....	12.50 to 13.50
No. 2 cast (radiators, cast boilers, etc.)	12.00 to 13.00

Reinforcing Bars.—Business has continued at a fair rate during the last week, but no awards of outstanding size are reported. Interest is centered in a number of large pending projects on which early action is expected and which will require at least 5000 tons of bars. Foreign steel will be used in a number of fair-sized jobs which have been let recently, and distributors of imported material are actively seeking business in this territory. This has not seriously disturbed the price situation, and quotations are firm on the general run of orders.

Cast Iron Pipe.—Southern makers of pressure pipe continue to quote \$34 to \$35 per ton, Birmingham, but the market here shows some weakness with Northern foundries bidding \$35.60 and \$36.60 per ton, delivered New York, although there is an effort to maintain \$37.60 per ton, delivered, as the minimum. There is a fair volume of private buying in small lots. Amagansett, N. Y., opens bids

Aug. 22, on about 525 tons of water pipe; bids on centrifugal pipe are acceptable. On 3260 tons of 6, 8, 12 and 16-in. pipe for Fairlawn, N. J., a contractor in Orange, N. J., is reported to have been low bidder.

Prices per net ton, deliv'd New York:
Water pipe 6-in. and larger, \$35.60 to \$37.60; 4-in. and 5-in., \$41.60 to \$42.60; 3-in., \$51.60 to \$52.60; Class A and gas pipe, \$4 to \$5 extra.

Coke.—Prices are substantially unchanged, with furnace grade ranging from \$2.65 to \$3 per ton, Connellsville, and foundry at about \$3.50 per

net ton, Connellsville. Shipments of foundry grade are reported to be improving. Special brands of foundry coke continue at \$4.85 per net ton, ovens, and delivered prices are \$8.56 per net ton to northern New Jersey, Jersey City and Newark and \$9.44 to New York and Brooklyn. The market on domestic sizes of by-product coke is weak, but the foundry grade appears quite firm and unchanged at \$9 to \$9.40, Newark or Jersey City, and \$10.06 to \$10.29, New York or Brooklyn.

Cleveland

August Steel Business Shows Upward Trend—Pig Iron Higher Following Large Buying

CLEVELAND, Aug. 21.—Orders for finished steel are holding up to the recent volume, and August business with most of the mills will show a gain over that of July. Contract buyers generally are taking their full monthly quotas. Outside mills are booking a fair amount of business in small lots of steel bars and structural material, nearly all of this business going at 1.90c., Pittsburgh. Most consumers are protected by 1.85c. contracts.

The plate market shows a firmer tone, although 1.85c. is still being named by some producers except for small lots. Cleveland mills show a firmer attitude on steel bars, but are still quoting 1.85c., mill, for desirable orders. One Ohio mill has named 2c., Pittsburgh, and 2.05c., Cleveland, for steel bars for the fourth quarter. Alloy steel bar prices have not been named for that delivery. These continue to move in very satisfactory volume and regular prices are being well maintained.

Consuming industries in this territory are keeping up to recent operations. Forge shops doing automotive work are generally running at full capacity, and the operation of a number of other industries is around 75 to 80 per cent. Activity in the building field is rather slow. Additional Union Terminal work in Cleveland will require 1400 tons and inquiries are out for several highway bridges in New York.

A number of sheet mills have followed in advancing prices for the fourth quarter.

The Cleveland furnace price on pig iron for outside delivery has been advanced 50c. a ton and other Lake furnace prices show a firmer tone.

Pig Iron.—A definite upward price trend developed in the past week on both foundry and steel making grades. The two Cleveland producers of merchant iron marked up their price on foundry and malleable iron 50c. a ton for outside shipment to \$17. While they had been holding rather closely to \$16.50 recently, \$16.25 was for some time a common price in competitive sections. For Cleveland delivery, the price is unchanged at \$17.50, furnace. Another Lake furnace has advanced the price 25c. to 50c. a ton, now quoting \$17 to \$17.50. In the Valley district, \$16.75 seems now to be the ruling minimum price. The market in Michigan, which has ranged recently from \$17.50 to \$18, is now established on an \$18 basis. The waiving or cutting in two of the silicon differentials had been a rather common practice for some time. However, with the price advance producers

announce that full differentials will be maintained. The recent purchase of basic iron by an Ohio steel maker from a Cleveland furnace indicated that grade was firm in the Valley district at \$16. Now Valley producers have advanced their asking price to \$16.50 and it seems doubtful if basic can be had at the lower figure. The American Steel Foundries is inquiring for 3000 to 5000 tons of basic iron for its Alliance, Ohio, plant for delivery up to Dec. 1. Buying of foundry and malleable iron for the remainder of the year continued at a brisk rate during the past week, and Cleveland interests sold 63,000 tons. Several sales in lots up to 500 tons or more were made at the price advance. However, it is expected that the advance will have the tendency of checking the buying movement. The order books of several furnaces are so well filled that they are not soliciting business for the remainder of the year. Shipping orders are heavy and will show considerable gain this

month over those of July. The automotive industry continues to specify freely and considerable of the recent buying came from that source.

Prices per gross ton at Cleveland:

N'th'n fdy., sil. 1.75 to 2.25	\$18.00
S'th'n fdy., sil. 1.75 to 2.25	21.50
Malleable	18.00
Ohio silvery, 8 per cent....	28.00
Basic Valley furnace.....	\$16.00 to 16.50
Stand. low phos., V'ley furn..	26.50

Prices, except on basic and low phosphorus, are delivered Cleveland. Freight rates: 50c. from local furnaces; \$3 from Jackson, Ohio; \$6 from Birmingham.

Semi-finished Steel.—A Cleveland producer announces that it will probably name \$33, Cleveland, for sheet bars, billets and slabs for the fourth quarter, following a Youngstown mill that has announced that price f.o.b. Youngstown. Specifications continue heavy against \$32 to \$33 contracts. A northern Ohio mill has named \$39, Pittsburgh, as its price for forging billets for the fourth quarter.

Iron Ore.—The consumption of Lake Superior ore during July amounted to 4,632,907 tons, a decrease of 34,586 tons from June. The amount consumed in July, last year, was 4,294,215 tons. On Aug. 1, ore stocks at furnaces amounted to 21,823,615 tons and the total at furnaces and Lake Erie docks was 27,208,662 tons, or more than 4,000,000 tons below the stocks on the same date a year ago, when they amounted to 31,331,092 tons. Central district furnaces during July consumed 2,251,779 tons, a decrease of 53,470 tons for the month. Lake front furnaces used 2,205,262 tons, a gain of 14,237 tons for July. Eastern furnaces used 82,327 tons, a gain of 9483 tons. All-rail furnaces used 93,539 tons, a decrease of 4836 tons.

Sheets.—Several more producers have announced that their fourth quarter prices will be 2.75c. for black sheets, 2c. for blue annealed, with a 10c. per 100 lb. extra for 45 in. and wider material, 3.60c. for galvanized sheets and 4c. for auto body sheets, all Pittsburgh base. Consumers are showing no interest in fourth quarter contracts. The one-half of 1 per cent discount for cash within 10 days has also been adopted by additional manufacturers. While specifications continue good, they were not as heavy in the past week as during the previous week. Prices on black sheets are firmer, 2.65c. now being the usual minimum. Blue annealed and galvanized sheets are unchanged for current delivery, the former being available at 1.90c., Pittsburgh, and the latter at 3.45c., Valley.

Strip Steel.—Specifications for hot-rolled strip are fair, but there is little new business, as most buyers are covered through September. There is a tendency to stiffen up prices to 1.90c., Pittsburgh, for wide material for the fourth quarter. However, some of the mills seem willing to take hoop and band sizes at the prices that prevailed during the present quarter, or 2c. to 2.10c. Cold-rolled strip is rather commonly quoted at 2.65c., Cleveland, for 3 tons or over, al-

though mills are able to get 2.75c. for assorted lots.

Cold-Finished Steel Bars.—While makers generally have advanced the price \$2 a ton to 2.25c., Cleveland, some producers are giving their customers an opportunity to place orders for the remainder of the quarter at 2.15c. As most buyers were previously covered at the lower price, the advance will have little effect before October.

Wire Products.—The demand is rather slow. Price shading is still reported to \$2.50 per keg on nails and to 2.35c. per lb. on wire, but this is attributed to some jobbers who have contracts at lower prices that expire Oct. 10.

Reinforcing Bars.—Inquiry is out for 950 tons for the Lakeside Hospital buildings, Cleveland. The market continues irregular, with billet steel bars commonly quoted at 1.85c., Cleveland, or delivered at that price for local work, and rail steel bars at 1.75c., mill.

Warehouse Business.—The demand is well diversified and is about normal for August. Business from the building field is light. Regular quotations are generally being maintained.

Coke.—Specifications against foundry coke contracts show some gain, but new business is light. Prices are unchanged at \$3.50 to \$4.85 oven, for standard Connellsville foundry coke. The price of Ohio by-product foundry coke will probably be reestablished at \$7.75, Painesville, for September delivery. Heating coke is firmer, being quoted at \$2.75, ovens, at which some business has been taken for forward shipment.

Bolts, Nuts and Rivets.—The demand for bolts and nuts continues fair. Orders from the automotive industry are quite satisfactory. Rivets are moving rather slowly, but at the recent volume. Prices are well maintained.

Old Material.—Efforts of dealers and producers to get better prices for scrap are meeting with considerable success. Heavy melting steel scrap was advanced 25c. a ton in the past week and machine shop turnings and blast furnace grades were marked up 50c. a ton. These advances follow a 25c. per ton advance on some grades reported a week ago. The only sale to a consumer was 500 tons of No. 1 heavy melting steel taken by a local mill at \$14.50. The higher prices have not been established as yet by purchases by consumers, and dealers having outstanding orders are resisting the advances. However, with an advancing market the supply has become rather scarce and dealers have been forced to pay more for material for which mills are asking shipments. Dealers have paid \$13.50 for heavy melting steel and as high as \$8.25 for machine shop turnings. Those who sold short have been caught by the advance, for the prices they are now paying are as high or higher than the

prices of their outstanding orders with the mills.

Prices per gross ton delivered consumers' yards:

Basic Open-Hearth Grades	
No. 1 heavy melting steel.	\$13.25 to \$13.50
No. 2 heavy melting steel.	12.75 to 13.00

Continental Steel Corporation Acquires New Office Quarters

The Continental Steel Corporation, Kokomo, Ind., recently formed by a merger of the Kokomo Steel & Wire Co., Kokomo; the Chapman-Price Steel Co., Indianapolis, and the Superior Sheet Steel Co., Canton, Ohio, has purchased the former administration building of the Haynes Automobile Co. at Kokomo and has removed its general offices into the new quarters. The building is a two-story brick structure, containing 13,000 sq. ft. of floor space. On the first floor are located the executive, sales, purchasing and traffic departments and the second floor is given over to the accounting, statistical, pay and time and publicity departments, with some space for storage.

Desulphurizing Pig Iron With Alumina Slag

Production of high-alumina slag in the blast furnace is described in Technical Paper 425, Bureau of Mines, by T. L. Joseph, S. P. Kinney and C. E. Wood. (Brief notes on the use of such slags for high early-strength cement were printed in THE IRON AGE for June 21, page 1752.) This 32-page bulletin gives all the particulars concerning the runs and discusses the mutual interactions between slag and metal, with particular reference to desulphurization.

Members of the Electric Hoist Manufacturers Association sold about 11 per cent fewer hoists in July than in June, but the value of such orders increased 13 per cent as compared with June. Shipments were 9.4 per cent less in July than in June.

San Francisco

Alternate Bids on 7200 Tons of Plates and 22,000 Tons of Cast Pipe Taken by Utility District.

SAN FRANCISCO, Aug. 18 (*By Air Mail*).—Demand for steel products, as fall approaches, is showing some improvement and inquiries are becoming more numerous. One of the most important developments of the year is seen in the revival of oil field operations in the Santa Fe district in Los Angeles, and it is estimated that more than 60 new rigs are in the course of construction at present. This activity has resulted in a rather heavy demand for oil country goods.

Construction on the Pacific Coast so far this year has been below that of last year. Seattle, Wash., was the only city to show a gain in the valuation of permits issued in the first half of this year, compared with the total for the same period last year, the gain having been approximately \$7,000,000. Los Angeles and San Francisco showed a decrease of about \$6,000,000, and Portland, Ore., a drop of \$8,000,000.

Pig Iron.—Both sales and inquiries for foundry pig iron this week were restricted to small lots, and foundry operations have shown little or no improvement. No change in quotations has occurred.

Prices per gross ton at San Francisco:

*Utah basic	\$25.00 to \$26.00
*Utah fdy., sil. 2.75 to 3.25	25.00 to 26.00
**Indian fdy., sil. 2.75 to 3.25	24.00 to 25.00

*Delivered San Francisco.

**Duty paid, f.o.b. cars San Francisco.

Bars.—Inquiries for reinforcing bars have increased. Awards this week exceeded 800 tons and included 225 tons for an apartment in Los Angeles. Bids will be opened on Sept. 7 for 421 tons for three spillway projects for the East Bay Municipal Utility District, Oakland, Cal. Bids on a bridge at Salem, Ore., requiring 260 tons, will be opened Sept. 4 and the State Highway Commission, at Sacramento, Cal., will let 395 tons for paving work in Sonoma County on Sept. 5. Low prices continue to prevail on out-of-stock material in the San Francisco district.

Plates.—Bids were opened this week on one of the most important projects to come up for figures this year, approximately 7200 tons of 5/16 to 3/4-in. material being called for in water distributing mains for the East Bay Municipal Utility Dis-

trict at Oakland. Alternate bids were also taken on cast iron, welded steel, lock-bar and reinforced, steel-lined concrete pipe. The engineers of the district are now at work tabulating the figures to determine just who is the low bidder. The only award of the week called for 287 tons of 14 to 22-in. welded steel pipe for Uplands, Cal., placed with the West Coast Pipe & Steel Co. of Los Angeles. The general range of prices continues at 2.25c. to 2.30c., with a few of the smaller companies quoting 2.20c., c.i.f. Pacific ports.

Shapes.—Demand for structural steel continues well sustained not only in the San Francisco district but in the Los Angeles district as well. The Pacific Coast Steel Co. was low bidder on 1400 tons for sheds for Pier 45 in San Francisco. Outstanding among new inquiries is 700 tons for an apartment in San Francisco. Mill prices on plain structural shapes are firm at 2.35c., c.i.f. Pacific ports.

Cast Iron Pipe.—Seattle has placed 200 tons of 4 and 6-in. Class B pipe for Thirty-fourth Avenue, N. W., with Fiorito Brothers and 271 tons of 48-in. Class B for a sewer in West Hanford Street, with Geo. Nelson. Bids were opened this week on 22,325 tons of 24 to 44-in. Class C pipe for the East Bay Municipal Utility District, but it is not yet known whether cast

iron or welded, lock-bar or reinforced concrete pipe will be used. The Pacific States Cast Iron Pipe Co. was low bidder on 318 tons of 2-in. Class B pipe for Los Angeles. Bids were opened this week on 114 tons of 8-in. Class B pipe for Santa Cruz, Cal., the Pacific States Cast Iron Pipe Co. being low bidder on Class 150. The United States Cast Iron Pipe & Foundry Co. was low bidder on 23,247 tons of 16 to 36-in. Classes B and C pipe for Dallas, Tex. Santa Ana, Cal., will open bids on Aug. 27 for 320 tons of 2 to 16-in. Class B pipe. San Diego, Cal., takes bids on Sept. 14 for 355 tons of 4 to 10-in. Class B. At Seattle, Wash., Tony Jakoboni was low bidder on 469 tons of 6 to 30-in. Class C pipe for the improvement of Forty-second Avenue, South, and S. A. Moceri was low on 282 tons of 6 to 12-in. Classes B and C for the improvement of Sixth Avenue, N. W.

Standard Pipe.—Distributors of standard steel pipe report a slight improvement in movement, but no outstanding sales or inquiries were noted. A decided revival of interest in oil country goods, especially well casing, has occurred, as a result of the bringing in of several gushers in the Santa Fe field in southern California. Most of the sales have been taken from the stocks of Los Angeles distributors, but it is understood these interests will replace the material at once.

Coke.—Because of the quiet conditions prevailing in the foundry field, movement of coke is by no means heavy and few large sales have been reported.

Youngstown

Specifications and Steel Production Heavy—Sheet Prices Are Uneven—Scrap Is Strong

YOUNGSTOWN, Aug. 21.—The rate of steel output in this district is still 80 per cent or higher, and the flow of specifications is so strong that producers generally feel that a reasonably full engagement of productive capacity is assured for the next 30 days at least. The Republic Iron & Steel Co. has all of its open-hearth furnaces in production, both here and at its Warren, Ohio, works. This is partly explained by the fact that at present it is banking a good many ingots at both plants to have a sufficient supply for the Warren plant for a period of six or eight weeks, when, on account of a suspension of the Trumbull-Cliffs furnace for relining and repairs, the Warren steel works will be operated on cold iron.

Incidentally, a strong market locally for scrap is due in part to some extra demands occasioned by the need of reserve supplies of steel by this company. This demand, coupled with the fact that steel works in the Canton district are so heavily engaged and are taking so much scrap that supplies originating in the Detroit district which move by rail have been going to that point, has made it

hard for either dealers or consumers to get much. The amount of Detroit scrap available for Youngstown is further limited by the fact that Cleveland and Buffalo melters are drawing heavily upon the offerings and shipping by boat. Since the water charge is much less than by rail, the companies able to ship by water are able to pay a higher price than those drawing supplies by rail. Not much scrap can move past Pittsburgh from the East, since dealers there are still actively trying to cover short sales.

The situation in scrap is having a strengthening effect upon the prices of pig iron. While business in the past week has not amounted to much, the feeling is general that pig iron is too low in relation both to costs and to the prices that scrap commands. An effort is being made to put foundry iron back to \$17, Valley furnace, for No. 2 grade, and the steel companies do not appear anxious for more business in basic grade at \$16, although a sale of 1000 tons is reported at that price.

The Youngstown Sheet & Tube Co. has announced \$33 as its fourth quarter price on sheet bars. This is an

Warehouse Prices, f.o.b. San Francisco

	Base per Lb.
Plates and struc. shapes.....	3.15c.
Soft steel bars.....	3.15c.
Small angles, 3/16-in. and over.....	3.15c.
Small angles, under 3/16-in.....	3.55c.
Small channels and tees, 3/4-in. to 2 1/4-in.....	3.75c.
Spring steel, 1/4-in. and thicker.....	5.00c.
Black sheets (No. 24).....	5.00c.
Blue ann'd sheets (No. 10).....	4.00c.

advance of \$1 a ton over the third quarter contract price. There is a good movement of sheet bars on contract, in keeping with the fact that sheet business is good, and the mills are running 85 per cent or more of capacity. An advance of \$2 a ton over what have been commonly regarded as the market prices on sheets is being sought on fourth quarter business. On current business, however, the market is no stronger than it has been and in spots is actually a shade weaker. It is no longer denied that 1.90c., base Pittsburgh, and in some cases f.o.b. Youngstown, has been done on blue annealed sheets; indeed, that price still is being quoted on business that is called desirable and 1.85c., base Youngstown, is reported to have come out on some No. 7 gage material in competition with

light plates. On galvanized sheets, the current market is still 3.40c. to 3.50c., base, and in some cases the price is f.o.b. Youngstown instead of Pittsburgh.

Bars and small shapes are well maintained in price. Contract buyers are still getting supplies at 1.85c., base, but on new business the mills are holding to 1.90c. Pipe business is good in seamless oil country goods and for oil and gas lines, but lap-welded oil well pipe and butt-welded pipe for building and construction are slow. Tin plate and strips are moving well. The outlet of the latter for the Republic Iron & Steel Co. is materially improved by its acquisition of Steel & Tubes, Inc., Cleveland, which has been using 5000 tons a month and, with new plants to be started, will take double that amount.

better than for some time past. The market is firmer at \$34 to \$35 per net ton, Birmingham, for 6-in. and larger. This price has held since early in July. Plant operations are said to be around 75 per cent, and current shipments are in excess of production. Present activity is not up to the level prevailing at this time last year. Last August there was a large carryover from the spring and early summer buying, which did not develop to the same extent this year.

Coke.—Little interest is being shown in coke. Present foundry requirements were booked some time ago, and only a small amount of spot business is coming in. Shipments are at a moderate rate. Quotations of \$5, Birmingham, for both spot and contract coke are being maintained.

Old Material.—Continued improvement in demand for No. 1 cast and steel grades is reported. No. 1 cast has been advanced 50c. a ton to \$14.50. No other price changes have yet been made. The outlook in all lines is somewhat better, and indications have been pointing upward for several weeks.

Prices per gross ton, deliv'd Birmingham dist. consumers' yards:

Heavy melting steel.....	\$8.50 to	\$9.00
Scrap steel rails.....	11.00 to	11.50
Short shoveling turnings..	7.50 to	8.00
Cast iron borings.....		8.00
Stove plate		13.50
Steel axles	19.00 to	20.00
Iron axles	21.00 to	22.00
No. 1 railroad wrought...	10.00 to	10.50
Rails for rolling.....		13.00
No. 1 cast.....		14.50
Tramcar wheels	12.50 to	13.50
Cast iron carwheels.....	12.00 to	13.00
Cast iron borings, chem...	13.50 to	14.00

Birmingham

River Shipments of Pig Iron Feature Quiet Market—Scrap Stronger

BIRMINGHAM, Aug. 21.—Pig iron demand is still largely for spot delivery, with quotations at \$15.50, base. Merchant producers continue to ship in excess of their current output. Interest in the fourth quarter is passive, and practically no attention has been given it. The Tennessee company is reported to be shipping pig iron to the Orient. There have been a number of movements by barge down the Warrior River. The Warrior River service has handled so far this month about 2600 tons. Shipments have also been made on the company's own barges. The only recent change in furnace operations was by the Tennessee company, which switched Ensley No. 6 from basic to foundry. As a result, there are now nine furnaces on foundry, six on basic, one on ferromanganese and one on recarburizing iron, a total of 17. The total has remained the same for six weeks. The Republic Iron & Steel Co. is rebuilding its No. 2 furnace. The rebuilt Gulf States Steel Co. furnace is now scheduled to go back in blast about Sept. 20.

Prices per gross ton, f.o.b. Birmingham dist. furnaces:

No. 2 fdy., 1.75 to 2.25 sil.	\$15.50
No. 1 fdy., 2.25 to 2.75 sil.	16.00
Basic	\$15.00 to 16.00

Finished Steel.—Demand for steel is holding at a favorable rate. August tonnage, through Aug. 17, was ahead of the same period in July and also of August, last year. Sheets are active and prices are steady, no changes in quotations having been made during the past several weeks. Open-hearth furnaces in operation continue to number 14, the Tennessee company having 11 and the Gulf States Steel Co. three. Structural steel fabricators report several orders of fair tonnage. The Nashville Bridge Co. was low bidder last week for the Louisiana State bridges at Chef Menteur and the Rigolets, near New Orleans. The con-

tract, calling for 2800 tons, will be awarded this week. The Birmingham Tank Co. is beginning the manufacture of small pressure tanks and septic tanks, in addition to its principal line of storage tanks.

Cast Iron Pipe.—Some additional tonnage, in small lots, has been placed with all of the local pressure-pipe plants. The volume last week was

Buffalo

Pig Iron and Scrap Markets More Active—Steel Mills Operating at Close to Capacity

BUFFALO, Aug. 21.—Pig iron inquiry and orders have picked up. The General Fire Extinguisher Co. wants 2500 tons of foundry; the H. B. Smith Co. has an inquiry out for 2000 tons; the Whitin Machine Works has issued one for 3000 to 5000 tons; a New York State melter seeks 1000 tons. The American Car & Foundry Co. bought 300 to 500 tons for Berwick, Pa., and the American Hardware Corporation bought 625 tons of foundry and malleable. Buffalo furnaces are adopting a stiffer price policy. Two of the local furnaces will not go below \$16.50 on New England delivery and are asking full differentials. One recently sold a tonnage of No. 1X iron at \$18, furnace, for Eastern delivery. The Hanna Furnace Co. has placed another stack in blast.

Prices per gross ton, f.o.b. furnace:

No. 2 fdy., sil. 1.75 to 2.25.....	\$17.00
No. 2X fdy., sil. 2.25 to 2.75.....	17.50
No. 1X fdy., sil. 2.75 to 3.25.....	18.50
Malleable, sil. up to 2.25.....	17.50
Basic	\$16.50 to 17.00
Lake Superior charcoal.....	27.28

Finished Iron and Steel.—Mills are operating at close to capacity. A tendency toward stiffer prices on bars, shapes, plates and sheets is notice-

able. Strip steel is active and prices on hot and cold-rolled show a firmer tendency. Bins for a cement company will require 150 tons of reinforcing bars, and the flooring for the new Rand Building will take 350 tons of the same material. West Side High School, Erie, Pa., will take 500 to 600 tons of reinforcing steel.

Old Material.—A sale of about 12,000 tons of No. 1 heavy melting steel at \$15 featured a more active week. Another consumer bought 10,000 tons of heavy melting steel in Detroit for \$11.75, which means \$13.50, delivered at Buffalo. This company's previous Buffalo purchase was at \$13.75, and it

Scrap Prices Advance in a More Active Market—Some Fourth Quarter Pig Iron Inquiry Appears

declines to pay Buffalo dealers more than that figure. It is difficult to indicate clearly the exact market on No. 1 heavy melting steel, as two of the largest consumers are paying all the way from \$13.75 to \$15. One is not rigid on inspection in the sense that what is rejected for its purposes as heavy melting steel will be accepted under another classification. Quotations on No. 2 heavy melting steel and on hydraulic compressed are based upon the \$13.75 price for heavy melting steel paid by the largest consumer, its differential on these grades being \$1.50. On the other hand, \$14 has been paid for No. 1 busheling, though the No. 1 busheling price paid by the largest consumer of this grade is \$12.25. There have been some sales of No. 1 machinery cast at \$14.50 and some stove plate was sold at \$14.

Prices per gross ton, f.o.b. Buffalo consumers' plants:

Basic Open-Hearth Grades	
No. 1 heavy melting steel	\$14.00 to \$15.00
No. 2 heavy melting steel	12.25
Scrap rails	13.00 to 13.50
Hydraulic comp. sheets	12.25
Hand bundled sheets	8.00 to 8.50
Drop forge flashings	12.00 to 12.50
No. 1 busheling	12.25
Hvy. steel axle turnings	12.00 to 12.50
Machine shop turnings	7.00 to 7.50
No. 1 railroad wrought	11.00 to 11.50
Acid Open-Hearth Grades	
R'l'd knuckles and couplers	15.00 to 15.50
R'l'd coil and leaf springs	16.00 to 16.50
Rolled steel wheels	15.50 to 16.00
Low phos. billet and bloom ends	16.00 to 16.50
Electric Furnace Grades	
Hvy. steel axle turnings	12.00 to 12.50
Short shov. steel turnings	10.00 to 10.50
Blast Furnace Grades	
Short shov. steel turnings	10.00 to 10.50
Short mixed borings and turnings	9.50 to 10.00
Cast iron borings	9.50 to 10.00
No. 2 busheling	9.00 to 9.25
Rolling Mill Grades	
Steel car axles	16.50 to 17.00
Iron axles	19.50 to 20.00
Cupola Grades	
No. 1 machinery cast	14.50 to 15.00
Stove plate	13.50 to 14.00
Locomotive grate bars	11.25 to 11.75
Steel rails, 3 ft. and under	16.00 to 16.50
Cast iron carwheels	12.00 to 12.50
Malleable Grades	
Industrial	15.00 to 15.50
Railroad	15.00 to 15.50
Agricultural	15.00 to 15.50

Scrap Institute Opens Offices in New York

The Institute of Scrap Iron and Steel has opened offices at 11 West Forty-second Street, New York, with Benjamin Schwartz, director general of the new organization, in charge. It is planned to begin work immediately on the establishment of machinery for arbitration of disputes. A national conference for the adoption of a code of business practices is under consideration, the meeting to be under the auspices of the Federal Trade Commission. Efforts will also be made to organize 11 chapters of the institute in various Eastern cities. The director general of the institute is seeking suggestions from interested dealers and others in the iron and steel scrap industry.

ST. LOUIS, Aug. 21.—While purchasing of pig iron continues mainly for the present quarter, some fourth quarter inquiry has appeared, and generally melters are taking more interest in supplies. Prices are asked on 800 tons of foundry by an East Side jobbing plant for delivery through the final three months, and another fourth quarter inquiry calls for about 2500 tons. Shipments continue to make a good showing, despite reduced melt in some quarters because of hot weather. No change in prices has occurred, and the market undertone is, if anything, slightly firmer. Actual sales reported total about 5000 tons, equally divided between the leading district producer and Southern blast furnaces. The largest single transaction was 1000 tons of malleable, taken by a nearby Illinois melter for shipment during the rest of the present quarter. Implement and stove makers continue to order freely, and jobbing plants are figuring more prominently in buying than heretofore.

Prices per gross ton at St. Louis:

No. 2 fdy., sil.	1.75 to 2.25, f.o.b.
Granite City, Ill.	\$18.50 to \$19.00
N'th'n No. 2 fdy., deliv'd St. Louis	19.66
Southern No. 2 fdy., deliv'd	19.92
Northern malleable, deliv'd	19.66
Northern basic, deliv'd	19.66

Freight rates: 81c. Granite City to St. Louis; \$2.16 from Chicago; \$4.42 from Birmingham.

Coke.—Aside from a slight quickening in demand for domestic sizes, no change has taken place in the coke situation. Deliveries of metallurgical grades are fairly satisfactory, despite curtailed melts at numerous plants, occasioned by the extreme temperatures. Fair contracting by industrial consumers for the rest of the year is reported by by-product plants. The bakery and water gas interests have contracted for slightly heavier ton-nages than at the corresponding period a year ago.

Finished Steel.—The leading district producer of sheets reports all units of its sheet division operating at full time, and a backlog sufficient to insure that pace for the next few weeks. Its plate mill is running at a 65 per cent rate. Sheet demand is above expectations and comes from a diversity of consumers. Tank plate demand suffers from apathy on the part of the oil interests. Warehousemen report August business to date very good, particularly in tubing and the general run of building material. The reinforcing bar market is featured by numerous small lettings, ranging from 25 to 75 tons. The only awards of moment reported were the following: 300 tons for a new St. Louis County building of the Ladies of the Sacred Heart, to the Laclede Steel Co.; 145 tons for Riley sewer, St. Louis, and 120 tons for new Kennard Public School, St. Louis, to the Missouri Rolling Mill Co.

Old Material.—A decidedly firmer tone has developed in scrap, and for the first time in several months specific advances were made in dealers' lists. Among the items marked up were heavy melting and shoveling steel, miscellaneous rails, switches and guards, knuckles and couplers and steel angle bars. Industrial consumers have been booking fair orders, and for the most part their scrap stocks are low. Yard stocks are also generally under the average for this season during the past five years. This fact, coupled with smaller railroad offerings, has caused the melters to take stock of their raw material supplies. Rails and rolling mill grades generally are in better demand, and more activity is noted in foundry stock. While actual buying has not gained heavily in volume, it is more diversified, and generally improved conditions from the seller's viewpoint are looked for by September. Marketing by the carriers fell sharply from totals of recent weeks. The only lists were 700 tons offered by the Gulf Coast Lines and 208 cars advertised by the Chicago, Rock Island & Pacific.

Dealers' buying prices, per gross ton, f.o.b. St. Louis district:

Heavy melting steel	\$11.00 to \$11.25
No. 1 locomotive tires	11.75 to 12.00
Heavy shoveling steel	11.00 to 11.25
Miscell. stand-sec. rails, includ'g frogs, sw'ches and guards, cut apart	12.50 to 13.00
Railroad springs	13.00 to 13.50
Bundled sheets	7.75 to 8.25
No. 2 railroad wrought	11.00 to 11.50
No. 1 busheling	9.00 to 9.50
Cast iron borings	8.25 to 8.75
Iron rails	13.00 to 13.50
Rails for rolling	13.00 to 13.50
Machine shop turnings	7.00 to 7.50
Steel car axles	18.00 to 18.50
Iron car axles	25.50 to 25.75
Wrot. iron bars and trans.	18.25 to 18.75
No. 1 railroad wrought	9.00 to 9.50
Steel rails, less than 3 ft.	15.00 to 15.50
Steel angle bars	12.50 to 13.00
Cast iron carwheels	13.00 to 13.50

Boston

Further Advance in Scrap Prices—Large Inquiries for Pig Iron Are Pending

BOSTON, Aug. 21.—Although Buffalo pig iron producers have advanced prices 50c. a ton and non-competitive business has been booked at \$17 a ton, furnace, for No. 2X and at \$18 for No. 1X, iron from that district is still offered at lower prices, and there is as yet no perceptible stiffening in prices for irons made east of Buffalo. Sales in the past week were larger than those for the previous week, and indications are they will be still larger this week. The Whitin Machine Works, Whitinsville, Mass., will probably today close on 500 tons of iron, silicon 3 to 3.50 per cent, and on 500 tons of higher silicon iron; the General Fire Extinguisher Co., Providence, R. I., will buy 1000 tons of No. 2X and 1000 tons of No. 1X; a Connecticut foundry is in the market for 1200 tons of No. 2X and No. 1X; four each, mostly 2X and 1X; and several other large consumers seek 1000 tons other melters are inquiring for smaller tonnages. The General Electric Co. is asking for bids on a sizable tonnage for its New England plants.

Foundry iron prices per gross ton deliv'd to most New England points:

*Buffalo, sil. 1.75 to 2.25..	\$20.91 to \$21.41
*Buffalo, sil. 2.25 to 2.75..	21.41 to 21.91
†Buffalo, sil. 1.75 to 2.25..	19.78 to 20.28
†Buffalo, sil. 2.25 to 2.75..	20.28 to 20.78
East. Penn., sil. 1.75 to 2.25	23.15 to 23.65
East. Penn., sil. 2.25 to 2.75	23.65 to 24.15
Va., sil. 1.75 to 2.25.....	25.71
Va., sil. 2.25 to 2.75.....	26.21
Ala., sil. 1.75 to 2.25.....	22.41 to 24.27
Ala., sil. 2.25 to 2.75.....	22.91 to 24.77

Freight rates: \$4.91 all rail and \$3.78 rail and water from Buffalo; \$3.65 from eastern Pennsylvania; \$5.21 all rail from Virginia; \$6.91 to \$8.77 from Alabama.

*All rail rate. †Rail and water rate.

Shapes and Plates.—Mill prices on standard shapes and plates are stiffer than they have been in months. While some material is still being delivered on old contracts at 1.85c. per lb., base Pittsburgh, practically all new business for the current quarter is being

taken at 1.90c. For fourth quarter, 2c., Pittsburgh, is being quoted. The market is bare of sizable fabricated structural steel prospects, but most shops are well filled up with work and a great many small jobs are being taken.

Bars.—The market for steel bars is fairly active and firm at 1.90c. to 2c., base Pittsburgh. Average specifications against contracts are somewhat larger than a month ago, although many consumers continue to buy from hand-to-mouth. Prices on reinforcing steel bars are firm, with 1.90c. per lb., base Pittsburgh, the general asking price for stock lengths by mills. From local stock, less than 10-ton lots are generally 3.01½c. per lb., base, and 10-ton and larger lots, 2.61½c. to 2.71½c.

Cast Iron Pipe.—The feature of the cast iron pipe market is the volume of quiet buying. Open municipal business is scarce; 100 tons of 8-in. pipe wanted by Medford, Mass., bids closing Aug. 24, is the only tonnage reported. The United States Cast Iron Pipe & Foundry Co. has sold 150 tons of 6-in. pipe to Newton, Mass. The range on 4-in. pipe is \$45.10 to \$46.10 a ton, delivered common Boston freight rate points, and on 6-in. to 12-in., \$41.10 to \$42.10. The usual \$5 differential is asked on class A and gas pipe.

Coke.—The coke situation is unchanged. New England fuel remains at \$11 a ton, delivered within a \$3.10 freight rate zone. The demand for

foundry fuel is steadily gaining owing to an increase in the current and prospective melt of iron. The announcement that hard coal will be advanced Sept. 1 has stimulated the demand for domestic coke.

Old Material.—A further advance has occurred in prices of heavy melting steel, rails, borings, skeleton, flashings, shafting, axles, pipe and machinery cast. The advance in machinery cast is based on dwindling supplies and increased demand from New England consumers, and that on other materials is due to a better Pennsylvania steel mill demand. Now that prices have recovered somewhat, owners of material are reluctant to sell, and the tonnage of scrap moved out of New England the past week did not increase much. The export market continues fairly active at \$9.25 a ton, on dock here, for No. 1 steel, and at \$8.50 to \$8.75 for No. 2 steel. One steamer is finishing loading for Danzig and another will load next month for the same port.

Buying prices per gross ton, f.o.b. Boston rate shipping points:

No. 1 heavy melting steel.	\$9.50 to \$9.75
Scrap T rails.....	8.50 to 9.00
Scrap girder rails.....	8.00 to 8.25
No. 1 railroad wrought...	8.50 to 9.00
No. 1 yard wrought.....	7.00 to 7.50
Machine shop turnings...	5.00 to 5.50
Cast iron borings (steel works and rolling mill)...	5.50 to 6.00
Bundled skeleton, long....	7.00 to 7.50
Forge flashings.....	7.00 to 8.00
Blast furnace borings and turnings	5.00 to 5.50
Forge scrap	5.50 to 6.00
Shafting	12.00 to 12.50
Steel car axles.....	14.00 to 14.50
Wrought pipe 1 in. in diameter (over 2 ft. long)	8.00 to 8.50
Rails for rolling.....	9.50 to 10.00
Cast iron borings, chemical	9.50 to 10.00

Prices per gross ton deliv'd consumers' yards:

Textile cast	\$13.50 to \$14.00
No. 1 machinery cast.....	15.00 to 15.50
No. 2 machinery cast.....	13.50 to 14.50
Stove plate	10.00 to 10.50
Railroad malleable	13.50 to 14.50

Canada

Iron and Steel Business Continues at High Level for This Time of Year

TORONTO, ONT., Aug. 21.—The bet-terment that has featured business in the Canadian iron and steel industry since the beginning of this year continues. Demand has been holding at a high level.

The financial report of the Lake Superior Corporation for the year ended June 30, last, shows sales for the year at \$14,740,613, compared with \$10,775,558 for the preceding year, or a gain of 37 per cent. Orders on hand at the close of the fiscal year totaled \$3,277,183.

Ross H. McMaster, president Steel Co. of Canada, Ltd., Hamilton, Ont., has outlined a development program of the company to be carried out during the next two years, which will call for an expenditure of between \$6,000,000 and \$7,000,000, funds for which are available in the company's investment account. It has been decided to dismantle the original open-hearth installation, which was supplemented by the building of No. 2 open-

hearth department in 1915-16. The latter department will be extended. Plans also include the replacement of the present 14-in. and 10-in. rolling mills with a modern combination 10-in. and 12-in. train.

Pig Iron.—Business remains steady and local blast furnace representatives report sales at a high level for this season. Demand for merchant iron in lots from 50 to 200 tons reached a total of approximately 800 tons for the week, while inquiries call for close to 1200 tons for delivery during the next six weeks.

Prices per gross ton:

Delivered Toronto

Structural Steel.—Sales for the week total more than 10,000 tons for the Toronto and Montreal markets alone. Upward of 35,000 tons of structural steel and 15,000 tons of reinforcing bars are involved in prospective business which is expected to be closed before winter. For the new Customs and Excise building to be erected in Toronto by the Federal Department of Public Works, 4000 tons of reinforcing steel will be required; the T. Eaton Co., Ltd., 190 Yonge Street, Toronto, will call for bids shortly for the erection of a new furniture building at College and Yonge Streets, for which between 7000 and 10,000 tons of structural steel will be needed; the Grand Central Markets Syndicate, Toronto, Ont., has a building construction program for this city requiring the use of 6000 tons of structural steel and 800 tons of reinforcing bars.

Old Material.—Shipments of heavy melting steel and turnings to the Hamilton, Ont., district are large, and although most of this is against old contracts, some new business is included. Local dealers report a steady demand for machinery cast and a few other special lines. In the Montreal territory some improvement has featured demand on domestic consumption account, but export business has declined. Dealers are purchasing both for direct shipment and for winter needs, and yards are fairly well stocked. Prices are firm but unchanged.

Dealers' buying prices:

	Per Gross Ton	
	Toronto	Montreal
Heavy melting steel.....	\$9.00	\$7.00

New Buffalo Plant to Make Cold-Finished Steel Bars

Bliss & Laughlin, Inc., Harvey, Ill., will shortly begin construction of a plant in South Buffalo for the manufacture of cold-finished steel bars and shafting. This plant will be similar to the one now in operation in Illinois. Paul J. Kalman is president of the company and Walter R. Howell is vice-president and general manager. Mr. Kalman is also president of the Kalman Steel Co., which has been established in the Buffalo district for many years, having taken over the plant of the Corrugated Bar Co. in 1923. The new Buffalo plant will cost \$1,000,000.

Cincinnati

Pig Iron Market More Cheerful But Business Is Light—Alabama Coke Sold at Low Prices

CINCINNATI, Aug. 21.—Sentiment in the local pig iron market is somewhat more cheerful, being influenced by the firmer tone of Lake Erie and Valley iron. The Lake Erie producers have until lately been selling freely in the Cincinnati district at \$16.50, furnace, or less, but having announced that their minimum for shipment outside the Cleveland district is now \$17, they are expected to become less of a factor in this market. The iron market is quiet, orders being mostly for small lots, and inquiries are not of outstanding size. The Peerless Mfg. Co., Louisville, Ky., is in the market for 300 tons of Southern iron, 2.25 to 2.75 per cent silicon, and another northern Kentucky melter is inquiring for 300 tons of Northern foundry iron. Both of these inquiries are for fourth quarter. There are a few other inquiries,

including one for 400 tons for an Indiana melter. The report that a Columbus, Ohio, furnace has been quoting \$16.50 in this district is said to be incorrect.

Prices per gross ton, deliv'd Cincinnati:

So. Ohio fdy., sil. 1.75 to 2.25	\$19.89
So. Ohio malleable.....	\$20.14 to 20.89
Ala. fdy., sil. 1.75 to 2.25..	19.19
Ala. fdy., sil. 2.25 to 2.75..	19.69
Tenn. fdy., sil. 1.75 to 2.25	19.19
So'th'n Ohio silvery 8 per cent	26.89

Freight rates, \$1.89 from Ironton and Jackson, Ohio; \$3.69 from Birmingham.

Coke.—The coke market in this immediate district and in Indiana as well has been disturbed by sales of Alabama coke at delivered prices lower than Northern competitors are said to be quoting. Prices quoted by local distributors have not been changed to meet the situation.

British Exports Fall Off, Imports Higher Decline of 9 Per Cent in Outward Movement Affected Most Items—Import Gain Was 4 Per Cent

WASHINGTON, Aug. 21.—Reversing the trend of the past few months, imports of iron and steel into Great Britain increased while exports decreased in July, according to a cablegram received by the Department of Commerce from London. Imports totaled 218,957 gross tons, against 210,405 tons in June, while exports declined to 333,079 tons from 365,890 tons.

Twelve of the 19 classifications into which the British trade is divided showed import gains, while only seven registered losses. The largest increase was in ingots and semi-finished steel, with a total of 95,344 tons in July, against 86,866 tons in June.

Losses in exports were made in 18 of the 22 classifications of this movement. The increases, where made,

were only slight, except in rails, which rose to 34,897 tons from 25,388 tons. Tin plate exports dropped to 43,584 tons from 54,615 tons, and pig iron and ferroalloys showed a decline to 32,272 tons from 39,284 tons.

Returns covering the production of pig iron and raw steel in British furnaces during July showed a decided decrease when compared with June figures. In all, 537,800 tons of pig iron was poured during July, a reduction of 25,900 tons from that made in June. The output of steel totaled only 666,900 tons, against 709,500 tons for June. The end of July saw 10 fewer blast furnaces lighted, leaving but 131 in production. The number of open-hearth furnaces in operation also decreased, dropping to 236, a decline of 26.

Non-Ferrous Metal Markets

Copper Strong But Quiet, Consumers Buying Tin Actively, Lead and Zinc Firm With Buying Mod- erate

Copper.—Buying of copper by both domestic and foreign consumers has been quite heavy. Domestic users have probably contracted for 80 per cent of their September needs thus far this month, and some producers have disposed of all of their copper allotted to domestic consumption for that month. Foreign buying has been confined largely to August deliveries with some September metal sold. Very little October copper has been contracted for. Sales for export have averaged at least 50,000 tons per

*Refinery quotation; delivered price ¼c. higher.

month up to August, but thus far this month probably not more than 30,000 tons has been placed under contract, according to some estimates in the trade. Prices remain firm at the levels which have prevailed since late in May: electrolytic copper at 14.75c., delivered in the Connecticut Valley, and at 15c., c.i.f. usual European ports, as the official quotation of Copper Exporters, Inc. Following a fairly active week, Monday and Tuesday the market was quiet and featureless. Lake copper is quiet but firm at 14.75c. to 14.87½c., delivered.

Tin.—Continued fairly heavy buying by consumers for comparatively nearby delivery is still the feature of the market. Sales for the week ended Saturday, Aug. 18, probably totaled

1500 tons. Sellers regard this movement as indicating that consumers are short of stocks and have postponed their buying until nearly the last moment. Dealers, on the other hand, are nervous and are doing little business. Consumers have been buying principally for spot and August delivery as well as the first half of September. Demand for all September delivery has been light and, up to Saturday, October-November-December delivery had received little attention. This was regarded as significant and as a feature of strength for the future. Monday, however, consumers again became very active, taking 500 to 600 tons, and began to absorb the later deliveries already referred to. On Tuesday at least 500 tons for de-

livery from September to November was sold to consumers with the market again very active. Spot Straits tin was quoted Tuesday at 47.87½c., New York. At London, Tuesday, prices fell again, following a sharp decline on Monday, and spot standard was quoted at £211 17s. 6d., future standard at £207 15s. and spot Straits at £214 17s. 6d. At Singapore, the quotation was £211 10s. per ton, with sales of 325 tons, bringing the total for the last week approximately to 1500 tons, a very large volume for Far Eastern sales. A feature of the market is that consumers have been so active recently that the premium on September over December delivery is now close to 1½c. per lb. Arrivals thus far this month have been 3350 tons, with 7730 tons reported afloat.

Lead.—Following a week of fairly steady buying, mostly of carload and small lots for spot and August delivery, the market Monday and Tuesday has been quite active. Monday is reported as one of the biggest days in some time, with Tuesday's business also active but in smaller volume. Demand on Monday was for September metal. On Tuesday, September as well as some August metal was sold, one inquiry calling for 200 tons for August delivery. Prices are firm and unchanged at 6c., St. Louis. The contract quotation of the American Smelting & Refining Co. is still 6.20c., New York.

Zinc.—Buying of prime Western zinc has been moderate but quotations have been very steady at 6.25c., East St. Louis, or 6.60c., New York. The market is featureless, each day re-

vealing a moderate amount of inquiry and buying. So far this week (Monday and Tuesday) there has been the average amount of business and inquiry. Ore was again \$40 per ton, Joplin, at the close of last week. Sales were about 9000 tons with shipments about 10,500 tons and output about 12,800 tons, leaving stocks at approximately 38,800 tons on Aug. 18, against about 36,400 tons on Aug. 11.

Antimony.—The market is stronger and stocks are becoming scarcer, with not a large amount of metal reported afloat. For spot and future delivery Chinese metal is quoted at 10.25c. and higher, duty paid, New York.

Nickel.—Ingot nickel in wholesale lots is quoted at 35c., with shot nickel at 36c. and electrolytic nickel at 37c. per lb.

Aluminum.—Virgin metal, 98 to 99 per cent pure, is quoted at 23.90c. per lb., delivered.

Non-Ferrous Metals at Chicago

CHICAGO, Aug. 21.—This market is quiet. Prices for tin and lead have advanced and quotations on zinc are lower. The old metal market is sluggish.

Prices, per lb., in carload lots: Lake copper, 15.25c.; tin, 50.50c.; lead, 6.15c.; zinc, 6.30c.; in less-than-carload lots, antimony, 11c. On old metals we quote copper wire, crucible shapes and copper clips, 10.75c.; copper bottoms, 9.75c.; red brass, 9.50c.; yellow brass, 7.25c.; lead pipe, 4.75c.; zinc, 3.50c.; pewter, No. 1, 30c.; tin foil, 36.25c.; block tin, 45.25c.; aluminum, 12c.; all being dealers' prices for less-than-carload lots.

REINFORCING STEEL

AWARDS of only 2900 tons and new projects calling for 3700 tons both dropped below the average of recent weeks. The following awards include no jobs of outstanding size:

QUINCY, MASS., 100 tons, stores and offices, to Morrison-Stevens Co.
NEW YORK, 100 tons, miscellaneous work at Hunt's Point station of Consolidated Gas Co., to McClintic-Marshall Co.
BROOKLYN, 110 tons, Pierpont apartment hotel, to Carroll-McCreary Co., Inc.
STATE OF PENNSYLVANIA, 140 tons, road work in Bedford and Somerset counties, to Truscon Steel Co.
CHICAGO, 450 tons, rail steel, apartment building on Fullerton Parkway, to Calumet Steel Co.
CHICAGO, 360 tons, two public schools; 180 tons, to Concrete Engineering Co., and 180 tons to unnamed bidder.
CHICAGO, 135 tons, bridge for Baltimore & Ohio Railroad, to Jones & Laughlin Steel Corporation.
GALESBURG, ILL., 190 tons, reservoir, to unnamed bidder.
PEORIA, ILL., 100 tons, Young Women's Christian Association building, to Concrete Engineering Co.
SIOUX CITY, IOWA, 200 tons, building for Swift & Co., to Concrete Engineering Co.
OMAHA, NEB., 200 tons, Illinois Central elevator, to unnamed bidder.
SEATTLE, WASH., 150 tons, Second Avenue,

South, viaduct, to Northwest Steel Rolling Mills.

SEATTLE, 100 tons, two bridges for State Highway Department, to Northwest Steel Rolling Mills.

OAKLAND, CAL., 130 tons, office building at Twenty-ninth and Summit Streets, to Pacific Coast Steel Co.

LOS ANGELES, 225 tons, loft building at 1022 Santee Street, to unnamed bidder.

LOS ANGELES, 190 tons, apartment building at 1432 Hope Street, to unnamed bidder.

Reinforcing Bars Pending

Inquiries for reinforcing steel bars include the following:

WALTHAM, MASS., 100 tons, hospital.

NEW YORK, 110 tons, miscellaneous work in Mott Haven yards of New York, New Haven & Hartford Railroad.

BUFFALO, 350 tons, flooring for Rand Building.

BUFFALO, 150 tons, additional bins for Bessemer Cement Co.

ERIE, PA., 500 to 600 tons, West Side High School.

EAST CHICAGO, IND., 600 tons, plant building for United States Gypsum Co.

CHICAGO, 100 tons, building for Peoples Furniture Co.

PHOENIX, ARIZ., 120 tons, two bridges for Highway Commission, at Cottonwood and Leroux, Wash.; bids Sept. 4.

SALEM, ORE., 260 tons, bridge over Mill Creek; bids Sept. 4.

PORTLAND, ORE., 160 tons, bridge over

Deschutes River near Maupin; Kuckenburg & Wittman, low bidders.

SACRAMENTO, CAL., 100 tons, paving in Sacramento County; L. C. Kaistedt, low bidder.

SACRAMENTO, 395 tons, paving in Sonoma County; bids Sept. 5.

WESTLEY, CAL., 210 tons, West Stanislaus Irrigation District; bids Sept. 1.

OAKLAND, CAL., 420 tons, South Spillway, Jackson Creek Spillway and Pardee Reservoir for East Bay Municipal Utility District; bids Sept. 7.

RAILROAD EQUIPMENT

ORDERS for 500 gondola car bodies for the Chesapeake & Ohio, and an inquiry for 100 to 200 gondola cars from the Illinois Traction System, were the outstanding developments in this market last week. The Great Northern is in the market for 10 locomotives, and six locomotives have been placed for export to three countries. Details of the week's business follows:

Great Northern is in the market for 10 mallet type locomotives.

Chesapeake & Ohio has ordered 300 hopper bottom gondola car bodies and repairs to trucks from Richmond Car Works and 200 similar units from American Car & Foundry Co.

Illinois Traction System, Springfield, Ill., is inquiring for from 100 to 200 composite gondola cars of 50 tons' capacity.

Chilean State Railways is inquiring for 20 passenger coaches.

American Railroad of Porto Rico expects to purchase 100 20-ton cane cars.

Chicago, St. Paul, Minneapolis & Omaha is inquiring for six additional gas-electric rail motor cars.

Kwang Tung Yueh Han, Canton, China, has ordered two 4-8-2-type locomotives from Baldwin Locomotive Works.

Mogyana Railway, Brazil, has ordered two 4-6-0-type locomotives from American Locomotive Co.

National Railways of Mexico has ordered two 4-6-2 locomotives from American Locomotive Co.

Illinois Central has ordered one 600-hp. oil electric locomotive from Ingersoll-Rand, Inc., and General Electric Co.

Reading Railroad is inquiring for two combination passenger and baggage gas-electric cars, three combination passenger, baggage and mail gas-electric cars and three trailers.

Cuyamel Fruit Co., New Orleans, is inquiring for 75 banana cars.

Midland Utilities Co. of Indiana has ordered two steel underframe caboose cars for service on Chicago, South Shore & South Bend from American Car & Foundry Co.

Cities Service Co. has ordered 10 tank cars from American Car & Foundry Co.

Sanitary District of Chicago has taken bids on 54 air dump cars of 30 cu. yd. capacity.

Use of the air mail between its Aurora, Ill., plant and its Pacific Coast factory at Los Angeles has made possible the production and shipment three or four days ahead of schedule of an elevator or conveyor built by the Stephens-Adamson Mfg. Co., according to C. H. Adamson, secretary of the company. The saving in time has been traced directly to the regular use of the air mail.

Fabricated Structural Steel

Brooklyn Department Store Takes 20,000 of Awards of 53,400 Tons—10,580 Tons Go for River Barges

WITH 20,000 tons for a department store building in Brooklyn and 10,580 tons required for 92 Mississippi River barges, awards of fabricated structural steel reported in the last week amounted to 53,400 tons. New projects, calling for 20,800 tons, included 7200 tons of plates for a municipal water undertaking at Oakland, Cal. Awards follow:

BOSTON, 200 tons, theater in Brighton district, to A. L. Smith Iron Works.
CAMBRIDGE, MASS., 250 tons, hospital, to New England Structural Co.
FALL RIVER, MASS., 125 tons, bank, to unnamed local fabricator.
NEW HAVEN, CONN., 1000 tons, high school, to Levering & Garrigues Co.
NEW YORK, 1500 tons, apartment house at Ninety-fourth Street and Central Park West, to Easton Structural Steel Co.
BROOKLYN, 20,000 tons, department store buildings for Abraham & Straus, to Post & McCord, Inc.; 6200 tons in first unit to be erected immediately.
BROOKLYN, 1250 tons, Pierpont apartment building, to Dreier Iron Works.
HARMON, N. Y., 250 tons, shop building for New York Central Railroad, to American Bridge Co.
ERIE RAILROAD, 250 tons, bridge at Rutherford, N. J., to Phoenix Bridge Co.
ATLANTIC CITY, N. J., 350 tons, garage for Chalfonte-Haddon-Hall, to Bethlehem Steel Co.
CARNEGIE, PA., 100 tons, mill building, for Superior Steel Corporation, to Fort Pitt Bridge Works.
PITTSBURGH, 120 tons, warehouse for Pennsylvania Railroad, to Pittsburgh-Des Moines Steel Co.
PITTSBURGH, 150 tons, Brookline public school, to McClintic-Marshall Co.
PITTSBURGH, 500 tons, Dithridge Street apartment building, to Levinson Steel Co., Pittsburgh.
PITTSBURGH, 130 tons, river barge for American Tar Products Co., to Jones & Laughlin Steel Corporation.
PITTSBURGH, 600 tons, post office and garage building, to McClintic-Marshall Co.
TOLEDO, OHIO, 135 tons, Toledo Garage; from Newton-Baxter Co., general contractor, to Massillon Bridge & Structural Co.

DETROIT, TOLEDO & IRONTON RAILROAD, 240 tons, bridge work, to McClintic-Marshall Co.
MARSHALL, ILL., 800 tons, bridge for Pennsylvania Railroad, to American Bridge Co.
WILMETTE, ILL., 100 tons, water tank, to Chicago Bridge & Iron Co.
CHICAGO, 950 tons, bridge, to Gage Structural Steel Co.
CHICAGO, 350 tons, public school, to Vanderkloot Steel Works, Chicago.
HAMMOND, IND., 550 tons, power plant, to Vierling Steel Works, Chicago.
MEMPHIS, TENN., 10,580 tons, 92 barges for Mississippi River Commission; 32 barges, 3680 tons, to Dravo Contracting Co.; 30 barges, 3450 tons, to Riter-Conley Co., and 30 barges, 3450 tons, to American Bridge Co.
BIRMINGHAM, ALA., 115 tons, Lower Tallassee Dam for Alabama Power Co., to Ingalls Iron Works.
NEW ORLEANS, 300 tons, incinerator plant, to Ingalls Iron Works.
BATON ROUGE, LA., 2800 tons, bridges, Nashville Bridge Co., low bidder.
STATE OF LOUISIANA, 4300 tons, bridge over Alchafalala River, to Mount Vernon Bridge Co.
MINNEAPOLIS, 3000 tons, Rand Building, to Minneapolis Steel & Machinery Co.
DENVER, COLO., 500 tons, public service building, to Minneapolis Steel & Machinery Co.
SEATTLE, WASH., 200 tons, Second Avenue, South, viaduct, to Nygren Brothers, Seattle.
VERNON, CAL., 230 tons, oil refining plant for Swift & Co., to McClintic-Marshall Co.
UPLANDS, CAL., 290 tons, plates, 14 to 22 in. welded pipe, to West Coast Pipe & Steel Co.
VENTURA, CAL., 570 tons, Bardsdale bridge, to McClintic-Marshall Co.

LOS ANGELES, 100 tons, studio stage for Fox Film Corporation, to McClintic-Marshall Co.
LOS ANGELES, 100 tons, studio stage on Washington Boulevard for Metro-Goldwyn-Mayer studios, to McClintic-Marshall Co.
LOS ANGELES, 100 tons, studio stage, at Universal City for Metro-Goldwyn-Mayer studios, to McClintic-Marshall Co.
RICHMOND, CAL., 300 tons, warehouse for City and Parr Terminal Co., to McClintic-Marshall Co.

Structural Projects Pending

Inquiries for fabricated steel work include the following:

WALTHAM, MASS., 350 tons, State hospital.
STATE OF MASSACHUSETTS, 250 tons, highway bridge.
NEW YORK, 1500 tons, doctor's building on East End Avenue.
NEW YORK, 1000 tons, service station for Packard Motor Co.
NEW YORK, 800 tons, public school No. 187.
NEW YORK CENTRAL RAILROAD, 500 tons, bridges at Cleveland.
PHILADELPHIA, 600 tons, hospital for University of Pennsylvania.
WASHINGTON, 550 tons, Government hangars.
QUANTICO, VA., 500 tons, marine barracks for United States Bureau of Yards and Docks.
CLEVELAND, 1400 tons, additional work for Cleveland Union Terminals Co.
DETROIT, 700 tons, building for Fisher Body Corporation.
CHICAGO, 1000 tons, First Regiment Armory.
MILWAUKEE, 1500 tons, Camp Building.
PORTLAND, ORE., 170 tons, bridge over Deschutes River; Kuckenburg & Wittman, low bidders.
OAKLAND, CAL., 7200 tons of plates, distributing mains for East Bay Municipal Utility District; bids in.
OAKLAND, 250 tons, hangar No. 4, Port Commission; Moore Drydock Co., low bidder.
OAKLAND, 170 tons, Jackson Creek Spillway for East Bay Municipal Utility District; bids Sept. 7.
SAN FRANCISCO, 1400 tons, pier shed at Pier 45; Pacific Coast Steel Co., low bidder.
SAN FRANCISCO, 600 to 700 tons, apartment building on Chestnut Street.
SAN FRANCISCO, 200 to 300 tons, I. Magnin Department Store.

Steel Castings Orders in July at 46 Per Cent Rate

WASHINGTON, Aug. 21.—Bookings of commercial steel castings in July totaled 66,714 net tons, or 46 per cent of the 144,200 tons capacity of the 129 reporting concerns, according to the Department of Commerce. Orders in June amounted to 71,745 tons, or nearly 50 per cent of capacity. July production totaled 78,397 tons, or 54 per cent of capacity, compared with 91,387 tons, or 63 per cent of capacity, in June.

Of the July orders, 20,483 tons was for railroad specialties, being 30 per cent of this class of capacity, against 22,597 tons, or 34 per cent of such capacity, in June. Orders for miscellaneous castings in July totaled

46,231 tons, or 60 per cent of capacity, against 49,148 tons, or 64 per cent of such capacity, in June.

Orders for steel castings for the seven months ended with July, amounted to 573,644 tons, compared with 611,435 tons for the corresponding period of last year.

Production of railroad castings in July totaled 27,501 tons, or 41 per cent of this class of capacity, compared with 30,742 tons, or 46 per cent of such capacity, in June. Production of miscellaneous castings in July amounted to 50,896 tons, or 66 per cent of this class of capacity, against 60,645 tons, or 79 per cent of this class of capacity, in June.

Production of castings for the seven months ended with July totaled 603,327 tons, against 627,949 tons for the corresponding period of last year.

Lebanon and Scranton Mills in New Corporation

Following ratification by stockholders of the Lebanon Iron Co., Lebanon, Pa., it is understood that a new company will be formed, which will include the Lebanon company and the recently acquired Scranton Bolt & Nut Co., Scranton, Pa. The new corporation, to be known as the Wrought Iron Co. of America, will probably be headed by Charles Hart, president Delaware River Steel Co., who has been active in reorganizing the Lebanon Iron Co. and arranging for acquisition of the Scranton company. It is reported that H. M. Clymer, general sales manager of the Lebanon company, will be vice-president of the new corporation.

PERSONAL

GEORGE M. NEWCOMER, who recently retired as first vice-president of F. L. Smidth & Co., New York, after 33 years of service, first became associated with the cement industry in 1893 as sales agent for the Aalborg Cement Co. of Denmark. In 1895 he aided in the formation of the American corporation of the F. L. Smidth Co. and had been prominent in its management until his retirement. HAROLD OSTERBERG, who has been identified with the company for 20 years, most recently as manager of its French and Belgian business, has been elected a vice-president.

JOSEPH H. DILLON, formerly chief engineer at the Coatesville, Pa., plant of the Bethlehem Steel Co., has been made assistant chief engineer at the Wisconsin Steel Works, International Harvester Co., South Chicago.

HORACE C. KNERR, consulting metallurgical engineer, Germantown, Philadelphia, is president of Metallurgical Laboratories, Inc., of Pennsylvania, 1116 West Montgomery Avenue, Philadelphia, which has been formed to specialize in the commercial heat treatment of aircraft parts. A. H. WILSON, JR., is secretary and general manager of the heat treating department, and others associated with the project are John J. Crowe, Arthur L. Collins, Charles William Potts, S. L. Gabel, Donald W. Kent, Horace Drever and Matthew M. Kennedy.

FRANÇOIS DE SAINT PHALLE has resigned as vice-president in charge of foreign sales for the Baldwin Locomotive Works and will devote his entire time to his general partnership in de Saint Phalle & Co.

HOWARD F. KULAS, who has been secretary in charge of production and manufacturing in the Cleveland division of the Midland Steel Products Co. since its formation in 1923, has been appointed vice-president with supervision of sales. J. E. MALONEY, formerly sales manager of the Cleveland plant, has been named general sales manager, succeeding W. G. Langdon, who has resigned.

JOHN W. BRAY, sales manager of the Bullard Machine Tool Co., Bridgeport, Conn., with Mrs. Bray, sailed on the Homeric, Aug. 18, for an extensive European trip. He will visit the Olympia Machine Tool Exhibit in London and will also spend time in Norway, Sweden, Germany, Belgium, Switzerland and Czechoslovakia, returning to this country late in November.

W. G. LANGDON, formerly sales manager of the Midland Steel Products Co., Cleveland, and previously sales manager of the Detroit Pressed

Steel Co., Detroit, has been appointed director of sales of the automotive parts division of the Cincinnati Ball Crank Co., Cincinnati. R. H. WALLACE, formerly manager of the Detroit plant of the Parish Mfg. Co., and more recently works manager of the Detroit plant of the Midland Steel Products Co., has been made director of manufacturing and engineering for the Cincinnati company, which will open a Detroit office at 10-253 General Motors Building on Sept. 1.

DAVID O. STEWART has been appointed St. Louis representative of the Clark Controller Co., Cleveland, and will have headquarters at 619 Bank of Commerce Building.

J. K. WISWELL of Chase, Parker & Co., Boston, dealer in mill supplies and heavy hardware, and Mrs. Wiswell, have sailed for Europe, where they will spend several weeks.

MAX EPSTEIN, founder and president of the General American Tank Car Corporation, has been elected chairman of the board, and ELIAS MAYER, for many years general counsel and vice-president, has succeeded Mr. Epstein as president.

THOMAS W. KENNEDY of the Mystic Iron Works and the Massachusetts Gas Cos., Boston, contrary to reports, is not to sever his connections with these companies. Announcement recently was made in Boston newspapers of the election of Mr. Kennedy as vice-president and secretary of the Boston Whippet Knight Corporation, and the report of his relinquishing his connections with the blast furnace was probably based on this announcement. Mr. Kennedy's connection with the automobile company is purely as an investment.

L. BLAINE SNOW, resident manager at Pittsburgh for Hickman, Williams & Co., and HENRY L. CAULKINS, who serves the company in a similar capacity at Detroit, have been made directors of the firm. Mr. Snow, who has been identified with the company for 12 years, was made Pittsburgh manager in 1919. Mr. Caulkins opened the company's Detroit office in 1923.

G. E. RANDLES, president of the Foote-Burt Co., Cleveland, has returned from a two months' trip to Europe.

WILLIAM JACOBSEN, recently associated with the Asbestos & Mineral Corporation, New York, has been appointed sales manager of the fiber department of the Keasbey & Mattison Co., Ambler, Pa., sales agent for the Bell Asbestos Mines, Inc., Thetford Mines, Quebec, Canada.

JOSEPH THOMPSON, for the last 21 years superintendent of the Steel Car Forge Co., Pittsburgh, has been appointed works manager at Hammond, Ind., for the Standard Steel Car Co., succeeding the late Emil Eiselt. JAMES H. RYAN, who has been located at the Pittsburgh office of the Standard company, has been made assistant works manager.

W. W. DEAL has been elected president of the United States Products Corporation, Birmingham, manufacturer of boiler treatments and distributor of industrial supplies. L. J. SAUERBORN continues as vice-president and general manager.

JOHN N. OSTROM, consulting bridge engineer, Chicago, has removed his office from 547 West Jackson Boulevard to the Engineering Building, 205 Wacker Drive.

ARTHUR L. TUSHBANT has been appointed director of sales for the Great Lakes Chemical Works, 5440 West Jefferson Avenue, Detroit, maker of solder, babbitt metal, lead, zinc, tin and special white metal alloys.

C. W. NIXON, who has been superintendent of the Bessemer, Ala., plant of the Central Foundry Co., has been made assistant general manager of all the company's Southern plants.

C. L. TAYLOR, chief engineer Morgan Engineering Co., Alliance, Ohio, has resigned, effective Sept. 1, to become associated with the Aetna-Standard Engineering Co., Youngstown.

HERBERT J. WATT has been appointed manager of railroad material sales for the Jones & Laughlin Steel Corporation, Pittsburgh, succeeding GEORGE D. BRANSTON. Mr. Watt has been assistant manager of the Pittsburgh district sales department.

THOMAS W. HARDY, for five years chief metallurgist of the Timken Roller Bearing Co., Canton, Ohio, has resigned to become metallurgical engineer in the Department of Mines, Ottawa, Canada.

Group Insurance for Colorado Company

Over 98 per cent of the 11,000 employees of the Colorado Fuel & Iron Co. have been signed, since July 1, for cooperative group insurance. The total amount now approximates \$20,000,000. Since the issuance of the contract, on which the company pays all costs of the insurance in excess of 60c. a month on \$1,000, there have been two death claims, both due to natural causes. The gross premium now is in excess of \$250,000 annually. The maximum protection an employee can take is \$2,000.

OBITUARY

FLOYD E. PATTERSON, secretary and treasurer and a director of the American Steel Foundries, Chicago, died on Aug. 12 at St. Luke's Hospital in that city. He was born at Yorktown, Ill., in 1859 and had devoted his entire business life to the steel and allied industries. At the formation of the American Steel & Wire Co. in 1898 he became assistant secretary and New

F. E. PATTERSON

York office manager, continuing with that company until 1902, when the American Steel Foundries was formed. He was elected secretary and treasurer of that company at its founding and retained that position until his death. He was also vice-president and a director of the Griffin Wheel Co., vice-president of the Damascus Brake Beam Co. and president and a director of the Galesburg Malleable Castings Co.

WILSON L. GOODRICH, Eastern sales representative of the A. Finkl & Sons Co., Chicago, died on Aug. 3, at the

Clinton Hotel, Springfield, Mass., after a short illness. He was born at Southington, Conn., and, when 15 years of age, entered the drop forge industry at that city, learning his trade as a die sinker. He continued in the drop forge industry until 1912, when he retired as superintendent of the Page-Storms Drop Forging Co., Chicopee, Mass. After a short period he entered the die block field and since that time had been engaged in the sale of die block and drop forge supplies. Before becoming Eastern representative for the Finkl organization four years ago, he was vice-president and sales manager of the Union Electric Steel Co.

GEORGE O. BERGSTROM, president of the Bergstrom Stove Co., Neenah, Wis., manufacturer of stoves, ranges, etc., died suddenly on July 29. He was 71 years of age and had established the industry more than forty years ago.

CLARENCE H. WAHNER, superintendent Paul E. Mueller Co., Milwaukee, manufacturer of steam and vapor heating plants, died suddenly at Hanover General Hospital on Aug. 13, aged 40 years.

J. B. FORD, for a number of years associated with the Standard Supply Co., Portland, Ind., died recently at his home in Muncie, Ind., aged 69 years. He had been engaged in the sale and manufacture of machinery during the greater part of his business life.

THOMAS G. MEACHEM, for a number of years vice-president and general manager of the New Process Gear Corporation, Syracuse, N. Y., and a pioneer in the development of gears for the automotive industry, died on Aug. 17 at the Mount Sinai Hospital,

New York, following an operation. He had been in ill health for about three months. Born at Onondaga Valley, N. Y., in 1878, Mr. Meachem attended Syracuse High School and St. John's Military Academy. In 1900 he became identified with the New Process Rawhide Co., founded by his father in 1888, which was engaged in cutting rawhide pinions and gears. The company later became the New Process Gear Corporation, and Mr. Meachem was connected with it until 1918, during the greater part of this period as vice-president and general manager. In the automotive field the company first made driving gears for early

T. G. MEACHEM

electric vehicles, but later produced an entire line of timing, transmission, differential and other gears for motor vehicles. The business was taken over by the Willys Corporation in 1918, and Mr. Meachem retired from the company. The following year, with his brother, he founded the Meachem Gear Corporation, of which he was president. When the business was sold to other interests a few years ago, Mr. Meachem retired from active business, but had continued to devote his time to other financial and civic enterprises at Syracuse. He was a member of the Society of Automotive Engineers.

Expansion in Industrial Use of Electricity

Industrial consumption of electricity is placed by *Electrical World* at 120.2 in July, compared with 116.4 in June, both being based on 100 as the monthly average of 1923-1925. Activity is considerably higher than in July, 1927, when 110.6 was reported. The average for the first seven months of 1928 was 119.9, compared with 115.7 in 1927.

An increase was shown in the metal industries group, which went from 122.7 in June to 124.2 in July. This gain came from the metal-working plants, ferrous and non-ferrous,

which advanced from 123.7 to 126.3, while rolling mills and steel plants at 121.2 remained stationary. Automobile plants, including those making parts, advanced from 136 in June to 143.7 in July. Several industries, however, showed drops, those for textiles and shipbuilding being sharp.

Chromium plated metal in sheets or strips, ready for immediate fabrication, will be marketed by the American Nickeloid Co., Peru, Ill., under the trade name "chromaloid." Articles made from this sheet metal are said to have the corrosion resistance, color and durability of the best chromium plated ware.

Sheet Steel Seaplane Hangar in Brooklyn

A sheet steel seaplane hangar, now being built by the Guaranteed Garages Corporation, Richmond Hill, N. Y., for the Brooklyn Air Transport, Inc., at Mill Basin, Brooklyn, is to be equipped with leak-proof interlocking device sheets. Every interlocking joint is equivalent to an upright, strengthening the building to carry roof load and walls and withstand storms. The hangar is designed to meet the requirements of the Dock Department or the Government and can be taken down and re-erected with 100 per cent salvage.

Sheet Sales Increase Heavily in July

Sales of steel sheets showed considerable gain in July over June, being 333,357 tons, as compared with 318,902 tons, according to the monthly report of the National Association of Flat Rolled Steel Manufacturers. However, production fell off 44,000 tons during July, and shipments decreased 30,000 tons. Sales exceeded shipments by 57,047 tons and shipments were 10,625 tons in excess of production. Unfilled orders Aug. 1 were 550,468 tons, a gain of 23,670 tons over July 1. The July report and comparisons follow:

	July	June	May
Total number of mills.....	721	721	721
Capacity per month.....	464,422	471,350	506,000
Percentage reporting.....	70.1	72.2	70.1
Sales.....	333,357	318,902	250,316
Production.....	287,885	311,629	349,367
Shipments.....	273,310	308,741	326,324
Unfilled orders	550,468	526,798	527,477
Unshipped orders.....	106,653	100,904	112,664
Unsold stocks.....	55,280	50,702	54,047
Percentages to Capacity			
Sales.....	102.4	96.5	68.5
Production.....	82.2	94.3	95.6
Shipments.....	85.5	93.4	89.3
Unfilled orders	169.1	159.4	170.4
Unshipped orders.....	32.8	30.5	30.8
Unsold stocks.....	17.0	15.3	14.8

Gain of 8 Per Cent in Building Permits

Reports from over 600 principal cities, which represent 80 per cent of the urban population of the United States, show a gain of 8 per cent in building permits during July, 1928, as compared with the same month a year ago, according to the national survey report issued by S. W. Straus & Co. The loss in July from June this year was about 8 per cent. This report does not consider particularly significant, because practically all of the plans for one and two-family houses which are to be erected during the summer months are filed in May or June. In July the total value of building permits was \$338,819,896, compared with \$313,666,388 in July, 1927, and \$368,416,737 in June, this year.

Steel Barrel Production Continued High

WASHINGTON, Aug. 21.—Production of steel barrels in July totaled 647,844 units, or 55.5 per cent of capacity, against 712,779 or 61.4 per cent of capacity in June, according to reports received by the Department of Commerce from 27 companies owning or operating 31 plants. Shipments in July totaled 645,881 barrels, compared with 717,496 barrels in June, while stocks at the end of July amounted to 55,806 barrels, against 53,868 barrels at the end of June. Unfilled orders at the end of July for delivery within 30 days totaled 341,346 barrels, while at the end of June this total was 319,

443. Unfilled orders at the end of July for delivery beyond 30 days amounted to 891,066, against 840,313 at the end of June.

Production in July was the greatest yet recorded for that month. It was exceeded by the three preceding months, each of which provided, in turn, a new high record. For the seven months, production has been 4,356,436 barrels, a gain of 10 per cent over the 3,969,974 produced in the first seven months of 1927.

Automobile Production Ahead of Last Year

WASHINGTON, AUG. 21.—Production of motor vehicles in the United States in July, according to the Department of Commerce, was 390,445, of which 337,933 were passenger cars and 52,512 were trucks. This compares with 396,967 in June, of which 356,439 were passenger cars and 40,528 were trucks. Production in July of last year totaled 268,485, of which 236,868 were passenger cars and 31,617 were trucks.

For the first seven months the total has been nearly 11 per cent ahead of last year, at 2,592,592 against 2,337,459. The gain was wholly in passenger cars, which totaled 2,303,660 against 2,039,488, an increase of 13 per cent. There was a decline of 3 per cent in production of trucks, which fell from 297,971 to 288,932, despite the fact that last month's output of trucks was the highest since September, 1925.

Sharp Reduction in Foundry Equipment Orders

Orders for foundry equipment in July are reported by the Foundry Equipment Manufacturers Association at 94.8 per cent of the average monthly shipments of 1922-1924. This is a reduction of more than one-third from the 149.1 of June and is the lowest figure since last September. It compares with 89.9 a year ago. Due to exceptionally high orders in May, the three-month moving average has been about 195 for the last three months. This is the highest point which the three-month average has had in some years.

Shipments are reported at 124.8 and unfilled orders at 332.1, both on the basis of monthly shipments as above.

Wage Earners, Horsepower and Production

Study of the census of manufacturers, made by the National Industrial Conference Board, New York, shows that the average number of horsepower for each wage earner has undergone a steady increase from 2.11 in 1899 to 4.27 in 1925. Iron and steel plants are given the highest horsepower rating, at 8.83 for each wage earner, or more than double the

average. Metals and metal products have 4.21, transportation equipment 3.38, machinery 3.16 and railroad repair shops 2.06 hp. for each wage earner.

Production (reduced in each case to dollars of 1914 purchasing value) shows a fairly steady advance from \$2,992 for each wage earner in 1899 to \$4,681 in 1925. This represents an increase of 56 per cent.

Better Employment in Metal Trades

Metal trades employment in July is given an index of 101.3 by the National Metal Trades Association, Chicago. The base of 100 is the monthly average of 1925-1927. The current figure is the highest in 16 months. There was a steady decline from March, 1927, to December, and there has been a steady rise since then. Wages in manufacturing industries are given as just above 100, little change having been shown since February. Cost of living is placed at about 97, having been between that figure and 99 for a full year.

Fabricated Steel Orders and Shipments High

WASHINGTON, Aug. 20.—Orders for fabricated structural steel in July totaled 225,623 tons, or 78 per cent of the capacity of the reporting 201 firms, with monthly capacity of 290,155 tons, according to the Department of Commerce. This compares with 239,540 tons, or 81 per cent of the capacity of the 216 reporting firms, for June. Computed bookings in July were 292,500 tons, against 303,750 tons in June. Computed shipments in July totaled 273,750 tons, or 73 per cent of capacity, compared with 266,250 tons, or 71 per cent of capacity, in June.

Except for June and May, the computed bookings in July were the highest since a year ago, when a total of 345,000 tons was reached. Computed shipments for July were the highest since August, 1927.

Increase in Wholesale Prices of Commodities

Prices of commodities in July are reported by the United States Bureau of Labor Statistics at 98.3, based on the 1926 average of 100 for 550 commodities. This shows an increase from the 97.6 of June and a much greater gain over the 94.1 of a year ago. Six of the 10 major groups of commodities showed increases over June, the largest gain being 2 per cent, in foods. There were small declines in four groups, of which metals and metal products was one. These showed a drop in both iron and steel and non-ferrous metals and a stationary price situation in agricultural implements, automobiles and other metal products.

Machinery Markets and News of the Works

Orders for Machinery Steady

August Business May Not Exceed That of July but
Is Well Above Midsummer Average

AUGUST business in machine tools does not fulfill some expectations for expansion this month in preparation for fall manufacturing activities, but the average is good for midsummer, even though the total for many sellers may be less than that of last month.

Absences of executives on vacations and the growing tendency to shut down plants for one or two-week vacation periods for all employees have tended to delay the placing of orders for machines recently quoted on, but the volume of business in prospect indicates that the slack will be taken up when activities are fully resumed for the fall.

In the Chicago territory the outlook is promising, particularly because of the sustained demand from manufacturers of agricultural equipment. Gasoline engine builders are among those now inquiring for tools. Automobile companies are also prospective buyers. The Studebaker Corporation contemplates issuing a large list at an early date, and the Nash Motors Co., which is building a plant addition, may need additional equipment. Orders are expected by the Chicago trade against lists recently issued by the A. O. Smith Corporation, Milwaukee, and the Chicago, Rock Island & Pacific Railroad.

Production at machine tool plants is being held at a fairly high rate.

New York

NEW YORK, Aug. 21.—Although developments in the first half of August gave promise that machine tool buying might equal that of July, excepting the very large orders placed by the Wright Aeronautical Corporation, the past week has been relatively quiet and a falling off in sales for the month is now indicated. Absences of purchasing executives on vacations and the closing down of some plants for one or two-week vacation periods have had the result of postponing the placing of orders. Outstanding in the week's transactions was the sale of 14 special Ransom grinders by a New York company to a Western manufacturer.

Sales of the Niles-Bement-Pond Co. during the week included 18 Ransom grinders, of which 14 of special design are for a Western manufacturer. Other sales included two 6-ft. and one 4-ft. radial drill and a 48-in. carwheel boring machine. The Pratt & Whitney division reported sales of four No. 2 jig borers, seven lathes and other single tools to various companies.

Plans have been filed by New York Edison Co., Irving Place and Fifteenth Street, New York, for addition to power plant at Fourteenth Street and East River, 106 x 256 ft., to cost close to \$2,000,000. Thomas E. Murray, Inc., 55 Duane Street, is consulting engineer.

Board of Estimate, Municipal Building, New York, is arranging fund of \$37,000,000 for a sewage and garbage disposal plant on Wards Island, including pumping machinery, power equipment, unloading and conveying machinery, and other mechanical equipment, and has authorized President Miller, Manhattan Borough, to carry out preliminary surveys and prepare plans at a cost not to exceed \$650,000. City engineering department, Municipal Building, will be active in project.

Board of Trustees, Children's Village School, Dobbs Ferry, N. Y., has plans for a one-story automobile machine and mechanical shop and trade school at institution, reported to cost in excess of \$75,000 with equipment. P. B. Nichols, Depot Plaza, White Plains, N. Y., is architect.

Texas Co., 17 Battery Place, New York, has approved plans for new oil refining plant near Cody, Wyo., with initial capacity for handling about 5000 bbl. per day, including construction of 12-mile pipe line to Oregon Basin Pool, for crude oil supply. Entire project is reported to cost in excess of \$450,000 with equipment.

Ice and refrigerating machinery, power equipment, conveying machinery and other mechanical equipment will be installed in new addition to ice cream factory of Loft, Inc., Fortieth Avenue and Ninth Street, Long Island City, reported to cost in excess of \$300,000.

International Nickel Co., 67 Wall Street, New York, has arranged a fund of more than \$5,000,000 for new smelting plant of

about 3000 tons per day capacity, and concentrating plant of 4500 tons daily capacity at properties at Sudbury, Ont., to handle output of its Frood mines, and will begin superstructure for various units at early date.

Somerville Iron Works, Somerville, N. J., has work under way on a new factory branch and distributing plant at Bessemer Avenue, S. E. and Seventy-fifth Street, Cleveland, site recently acquired. It will total about 50,000 sq. ft. floor space, and is reported to cost more than \$75,000 with equipment.

Nizinite Metals Corporation, Perth Amboy, N. J., recently organized, has leased property at 303 New Brunswick Avenue, and will install new plant for chrome-zinc plating and other metal-plating work, including metallurgical laboratory. Company is capitalized at \$200,000, and headed by R. L. Tuttle, president, and Emil Stremlau, treasurer. First-noted will be in active charge of plant production.

New Jersey Lamp Works, 21 William Street, Newark, will arrange equipment and facilities at plant for extensive production of new non-glaring headlight for automobiles, recently invented and patented by Asher Maurer, president.

General Tube Co., 49 Empire Street, Newark, manufacturer of sheet iron and other tubing, is having plans drawn for a four-story addition to cost in excess of \$100,000 with equipment. Portion of structure will be used for storage and distributing service. Simon Cohen, 134 Branford Place, is architect.

Stewart Steel Products Co., New York, has removed its offices to 8 West Fortieth Street.

Imp Specialties Corporation, Schenectady, N. Y., has been organized, with capital of \$100,000, to manufacture washing machines and parts. Plant in Schenectady has been rented with privilege of purchase and production will be started this month. Company has received bids on copper and other metal parts but no contracts have been awarded.

Taintor Co., Bayonne, N. J., has let contract for construction of factory building to John W. Ferguson Co., Paterson, N. J., through Lockwood Greene Engineers, Inc., New York.

Progressive Brass Foundry Co., formerly of 3 Ainslie Street, Brooklyn, has moved to larger quarters at 408-10 Park Avenue, Brooklyn.

New England

BOSTON, Aug. 21.—It now develops that of the 50 or more tools on which Boston asked bids for its new Hyde Park district school, only 42 were purchased, the most expensive being discarded owing to lack of funds. Of the tools purchased, Stedfast & Roulston, Inc., sold six; Henry Prentiss & Co., Inc., five; Lynd-Farquhar

The Crane Market

NEW inquiry for overhead cranes is rather limited and prospective buyers are slow in placing orders. The locomotive crane field is slightly more active with fresh inquiry, particularly for crawl-tread equipment, but orders are slow in materializing. About the largest outstanding inquiry for locomotive cranes is the list from Dwight P. Robinson & Co., New York, for export to Argentina.

Among recent purchases are:

Terry & Tench Co., Inc., Grand Central

Terminal, New York, 5-ton truck crane from Browning Crane Co.

Rosenthal Engineering Contracting Co., Inc., 12 East Forty-first Street, New York, 5-ton truck crane from Browning Crane Co.

Sims Construction Co., Philadelphia, 25-ton, 8-wheel, steam-driven, locomotive crane from Browning Crane Co.

Bureau of Standards, Washington, 15-ton, 32-ft. span hand power crane from Roeper Crane & Hoist Works.

Empire Granite Co., Elberton, Ga., 7½-

ton, 30-ft. span, 2-motor, overhead crane from Roeper Crane & Hoist Works.

Canales-Grogan Granite Co., Elberton, Ga., 7½-ton, 30-ft. span, 2-motor, overhead crane from Roeper Crane & Hoist Works.

Newport News Shipbuilding & Dry Dock Co., Newport News, Va., 2-ton, 35-ft. span, 3-motor, cage operated crane from Roeper Crane & Hoist Works.

Link Belt Co., Chicago, a 5-ton electric crane from Manning, Maxwell & Moore, Inc.

Co., 12; Reed-Prentice Corporation, one; J. G. Blount Co., seven; Brown & Sharpe Mfg. Co., five; Hendey Machine Co., three; Joseph Beal & Co., three. Pneumatic Drop Hammer Co., Boston, reports the sale of one small and nine large hammers to New York State, Ohio and Indiana manufacturers. Small tools continue to sell freely.

Homes Products, Inc., Bridgeport, Conn., recently organized to manufacture electric refrigerators under patents of Westinghouse Electric & Mfg. Co., East Pittsburgh, has leased two buildings of local plant of Remington Arms Co., and will occupy at early date for new works.

American Hardware Corporation, New Britain, Conn., has filed plans for a new addition, 30 x 56 ft.

Bird Machine Co., South Walpole, Mass., manufacturer of paper mill machinery, has completed plans for new one-story addition, reported to cost in excess of \$30,000, with equipment.

H. T. McCluskey & Sons, Inc., 525 Grand Avenue, New Haven, Conn., manufacturer of wire cloth, have asked bids on general contract for one-story addition, 42 x 60 ft., Dwight E. Smith, New Haven, is architect.

Chevrolet Motor Co., 110 Cummington Street, Boston, with headquarters at Detroit, has leased two-story and basement building now in course of erection at Vassar and Amesbury Streets, Cambridge, Mass., and will use for parts, service and repair work. Entire project is reported to cost more than \$85,000. Building is scheduled for completion in about four months.

Bids are to close this week for a 41 x 65-ft. manufacturing plant in Kendall Square, Cambridge, Mass., for the Crandall Engineering Co. Ralph T. Jackson, 44 School Street, Boston, is the architect.

Permission has been granted the Julian L'Este Co., 9 Spice Street, Boston, to make alterations and improvements to its brass foundry to cost \$3,500.

Olson Brothers, Plainville, Conn., are to build a one-story, 26 x 82 ft. plant addition for manufacture of screw machine products.

M. S. Little Mfg. Co., New Park Avenue, Hartford, Conn., is to build a one-story, 50 x 120-ft. brass foundry unit.

United States Aluminum Co., Fairfield, Conn., is to build a one and two-story office, laboratory and foundry unit, 625 x 250 ft.

Taylor-Hall Welding Corporation, formerly at 3 May Street, Worcester, Mass., is now located at 99 Hope Avenue, Worcester.

Philadelphia

PHILADELPHIA, Aug. 20.—Edward F. McHugh & Co., Kingston Station, Wilkes-Barre, Pa., have been incorporated with a capital of \$150,000 to manufacture copper moldings for store front construction and to job plate and other glass. Contracts for construction of manufacturing buildings have been let.

Milco Machine Co., Inc., Pottstown, Pa., has been formed to manufacture hat blocking machinery and kindred products. Products will be made in company's own factory and pipe fittings, valves, etc., will be purchased.

Contract has been let by Brown Instrument Co., Roberts Street and Wayne Avenue, Philadelphia, manufacturer of pyrometers and other recording instruments, to Robert E. Lamb Co., 841 North Nineteenth Street, for one-story addition to power house. Ballinger Co., Twelfth and Chestnut Streets, is architect and engineer.

Lester C. Bosler, 269 West Rittenhouse Street, Philadelphia, and associates have organized Automatic Appliances Co., to operate local plant for manufacture of tools and other metal appliances, and will begin production at early date. Morris E. Van Vliet, 436 East Mount Carmel Street, Glenside, Pa., is also interested in new company.

Sleight Metallic Ink Co., 538 North Third Street, Philadelphia, has acquired property at 717-19 West Congress Street, Chicago, 50 x 112 ft., and plans early construction of two-story factory branch and distributing plant to cost about \$35,000.

Philadelphia & West Chester Traction Co., Sixty-ninth and Market Streets, Philadelphia, has awarded general contract to John N. Gill Co., City Center Building, for one-story mechanical shop.

Arrangements have been made by Cramp-Morris Industrials, Inc., Richmond and Norris Streets, Philadelphia, for occupancy of portion of former shipyard of William Cramp & Sons Ship & Engine Building Co., one of its subsidiaries, by De La Vergne Machine Co., manufacturer of ice-making and refrigerating machinery, another division of same parent company, which heretofore has operated main plant at foot of East 138th Street, New York. Marine machine shops and adjoining mechanical units at shipyard will be used by last-noted company, which will remove present works to new location and provide additional equipment for increased output. New plant is scheduled to be ready for service early in November. Company has disposed of New York plant to R. Hoe & Co., Inc., 504 Grand Street, that city, manufacturer

of printing presses, saws, etc., which will remodel and improve for new main factory.

Board of Education, Sellersville, Pa., is said to be planning installation of manual training equipment in new two-story high school at Fifth and Church Streets, estimated to cost \$165,000, for which plans will be drawn by William Martin, duPont Building, Wilmington, Del., architect.

Carlisle Engineering Works, Carlisle, Pa., recently organized by Thomas MacDonald, Carlisle, and associates, with capital of \$50,000, plans early operation of local plant for manufacture of machinery, mill equipment and other mechanical products. Walter C. Stephens, Carlisle, is also interested in new company.

American Utilities Co., operated by Gannett, Seelye & Fleming, Inc., 602 North Second Street, Harrisburg, Pa., operating electric light and power properties in Kentucky, Arkansas, Missouri and other States, has arranged for a bond issue of \$1,000,000, portion of proceeds to be used for expansion and improvements including transmission line construction.

Lancaster Airways, Inc., Lancaster, Pa., J. P. Jones, head, has acquired tract of two acres of land on Manheim Pike, adjoining company airport, and plans early construction of new plant for manufacture of airplane motors, including parts and assembling departments, reported to cost close to \$25,000.

Reading Co., Reading, Pa., has authorized removal of its railroad shops at Seventh and Franklin Streets to another location, where increased facilities will be provided. Buildings abandoned will be leased for industrial service.

Pittsburgh

PITTSBURGH, Aug. 20.—Actual business in machine tools still is light, but the common tendency is to ascribe this condition to the vacation period and the absence from their offices of men who place orders rather than to a lack of requirements. The prospect, based upon the inquiries on which dealers are figuring, is considered bright. The Westinghouse Electric & Mfg. Co. has yet to buy some tools on its third quarter list. The Carnegie Steel Co. is expected to be in the market shortly for fabricating equipment for its new Pittsburgh warehouse to replace one which the Pennsylvania Railroad bought to get the site for an extension of its produce yard.

Plans have been filed by Board of Education, Fulton Building, Pittsburgh, for new Clifton B. Connelley trade and vocational school on Bedford Avenue, near Fullerton Street, to cost \$1,500,000 with equipment.

Standard Sanitary Mfg. Co., Bessemer Building, Pittsburgh, manufacturer of enameled iron and other sanitary ware, has awarded general contract to Hossler Brothers, Tiffin, Ohio, for three-story addition to plant at Broad Avenue and Fourth Street, Tiffin, reported to cost more than \$75,000 with equipment.

Board of Education of Franklin Township, Greensburg, Pa., is said to be planning installation of manual training equipment in new high school at Newlinsburg, estimated to cost about \$130,000, for which superstructure will soon begin. J. H. Phillips, Pittsburgh, is architect.

David H. Weisberg, 22 Tannehill Street, Pittsburgh, and associates have organized new company to be known as Sun-sine Electric Co., with capital of \$25,000, to operate local plant for manufacture of electrical specialties, and will soon begin production. Morris A. Cooper, 3330 McNeill Place, is also interested in new company.

Board of Education of Hempfield Township, Jeannette, Pa., is considering installation of manual training equipment in new consolidated junior high school on West Newton Road, reported to cost \$140,000, for which plans have been completed by C. H. Sorber, First National Bank Building, Greensburg, Pa., architect.

Goldberg Iron & Steel Co., Columbus, Ohio, operated by Harry and Arthur Goldberg, has acquired an interest in former plant of Becker Steel Co., South Charleston, W. Va., recently sold under receivership proceedings, and will be active in management in connection with proposed operation of works for production of high-speed tool steels. New equipment will be installed at early date. Company will operate under name of Trojan Steel Co.

South Atlantic

BALTIMORE, Aug. 20.—Benedict Stone Co. of Maryland, Inc., Montford Avenue and Boston Street, Baltimore, has taken over one of main buildings formerly used by Bethlehem Shipbuilding Co., Fort Avenue, Locust Point district, and will remodel and equip for new stone-working plant. Present works will be removed to new location and capacity increased. J. Kemp Bartlett is vice-president. Shipbuilding company has work under way on new drydock and shops to cost more than \$1,000,000.

Pollard Cyanite Co., Burnsville, N. C., recently organized by J. A. Pollard, Burnsville, and associates is said to have plans under way for new mining and refining plant to handle capacity of about 1000 tons of raw rock material per day, estimated to cost in excess of \$450,000.

Carolina Power & Light Co., Raleigh, N. C., is concluding negotiations for purchase of municipal electric lighting plant and property at Fremont, N. C., and plans expansion in that district, including transmission line construction.

Bureau of Yards and Docks, Navy Department, Washington, is asking bids (no closing date stated) for an electric bridge crane for installation at navy yard at San Diego, Cal., specification 5713. Also, until Sept. 5, for steam-generating plant at Quantico, Va., including 400 hp. water-tube boiler, motor-driven pulverizers, pumping machinery, coal and ash

handling equipment with ash tank and traveling weigh larry, ice-making and refrigerating machinery, specification 5602.

School Board, Baltimore, plans installation of manual training equipment in proposed new Northeast junior high school at Shaffer, Sefton and Carter Avenues, where site has recently been acquired, to cost approximately \$500,000, for which William W. Emmart, Union Trust Building, architect, has been engaged to prepare plans.

Maryland Dry Dock Co., Baltimore, is carrying out expansion and improvement program at shipyard in Baltimore harbor, opposite Fort McHenry, and has completed new drydock, 80 ft. wide and 400 ft. long; additional facilities will be provided for repair and reconditioning service in connection with proposed early operation of drydock unit. Hadley F. Brown is vice-president and general manager.

Feldspar Milling Co., Bowditch, (P. O. Micaville) N. C., recently organized, will proceed with construction of new local feldspar mill on tract of land lately acquired, reported to cost more than \$100,000, with machinery, and plans to have ready for occupancy in November. Rudolph Glatly, formerly head of North State Feldspar Co., Micaville, will be in charge of construction and production at new plant. C. P. Rogers, Tryon, N. C., is president.

Drayton Mills, Spartanburg, S. C., are erecting weave building, for which Lockwood Greene Engineers, Inc., is general contractor. Structural steel will be furnished and erected by Carolina Steel & Iron Co., Greensboro, N. C., and sash and glazing will be provided by William Bayley Co., Springfield, Ohio.

Buffalo

BUFFALO, Aug. 20.—A site has been acquired at Buffalo by Bliss & Laughlin, Inc., Harvey, Ill., manufacturer of steel shafting and kindred products, for new branch mill, for which plans will soon be drawn. Initial unit will cost more than \$500,000, with machinery and will provide facilities for employment of about 150 men.

Dupont Rayon Co., River Road, Buffalo, is said to have concluded negotiations for purchase of large tract of land at Waynesboro, near Richmond, Va., as site for new multi-unit mill, to include power house, machine shop, pumping station and other mechanical departments. Entire project is reported to cost more than \$15,000,000.

International Casement Co., Hopkins Avenue, Jamestown, N. Y., manufacturer of steel casements, casement adjustments, etc., is said to have authorized immediate call for bids for new one-story addition to cost more than \$75,000, with equipment, for which plans have been completed by Beck & Tinkham, Bailey Building, architects.

Curtiss Aeroplane & Motor Co., Kail Street, Buffalo, contemplates expansion in plant for considerable increase in present output. It is understood that details will be arranged during fall.

Rochester Empire Power Corporation, Rochester, N. Y., operating Rochester Gas & Electric Corporation and other power utilities in that district, has secured permission to acquire New York Central Electric Corporation, Perry; Elmira Water, Light and Railroad Corporation, Elmira; Marcellus Lighting Co., Geneva; and a number of other light and

power companies in neighboring sections, and will consolidate with its organization. Expansion plans are under consideration, including transmission line construction for connection with different systems, power switching stations and substations.

Department of Public Works, Municipal Building, Buffalo, is arranging for extensions in municipal airport at Cheektowaga, including hangar, repair and reconditioning shop and other units, reported to cost about \$60,000. H. Beck, Huyler Building, Buffalo, is architect.

Cleveland

CLEVELAND, Aug. 20.—Machine tool sales in this territory were quieter the past week than earlier in the month. Orders were confined to single machines. Little new inquiry developed. However, a fair amount of business is in prospect and dealers look for a more active market next month. The demand for turret lathes in single machines is holding up to recent heavy volume.

Ohio Rubber Co., Willoughby, Ohio, has placed contract with Austin Co., Cleveland, for \$50,000 plant extension for manufacture of automobile running boards.

L. D. Round, president Cleveland Chain Co., Cleveland, and associates, have purchased Bridgeport Chain Co., Bridgeport, Conn., and will operate it as a separate company as the Bridgeport Chain & Mfg. Co. Mr. Round will be president of the Bridgeport company and L. D. Hull, secretary and treasurer of the Cleveland company, will hold the same position with the Bridgeport company. Plants now controlled by the Cleveland company in addition to the Bridgeport company include the Krein Chain Co., Wapakoneta, Ohio, and the Seattle Chain & Mfg. Co., Seattle, Wash.

J. C. Virden and several associates, all of whom were connected with the J. C. Virden Co., Cleveland, which was recently moved to Philadelphia and merged with another plant, have organized a new company to manufacture residential and commercial lighting fixtures. This plant will be located in the plant formerly occupied by the Virden company at 6103 Longfellow Street, Cleveland.

Ramsey Chain Co., Albany, N. Y., has opened a branch warehouse and office at 2721 West Twenty-fifth Street, Cleveland. H. M. Davis is district manager.

McKinney Tool Co., Arabella Road and Roseland Avenue, Cleveland, has awarded general contract to A. H. Moss, Berea, Ohio, for one and two-story addition, 60 x 60 ft., and 40 x 40 ft., to cost about \$35,000, with equipment. E. G. Hoefler, Keith Building, is architect. E. W. McKinney is president.

Ohio Public Service Co., Hanna Building, Cleveland, is arranging an expansion and improvement program in plant and system at Elyria, Ohio, and vicinity, to cost about \$500,000. Work will be carried out over a two-year period.

City Council, Marion, Ohio, has acquired tract of about 100 acres of land for municipal airport, and plans construction of hangars, repair and reconditioning shops, oil storage and distributing buildings, and other mechanical units.

National Screw & Mfg. Co., 2440 East Seventy-fifth Street, Cleveland, has plans in progress for new one-story addition, 65 x 85 ft., to cost close to \$45,000 with equipment.

Board of School Trustees, State Normal School, Kent, Ohio, will receive bids until Aug. 31 for manual training equipment

for institution, including drill, bench grinder, lathe and other tools.

Winton Engine Co., 2116 East 106th Street, Cleveland, manufacturer of gasoline engines, Diesel combustion engines, parts, etc., recently organized to take over and expand Winton Engine Works, has arranged for sale of preferred stock to total about \$1,140,000, a portion of fund to be used for expansion and development. Company is said to have plans under way for two one-story units to cost upward of \$60,000 with equipment. George W. Codrington is president.

Board of Education, Newark, Ohio, plans installation of manual training equipment in new junior high school, estimated to cost \$225,000, for which bids are being asked on general contract until Aug. 31.

National Air Transport, Inc., Eastern Division, Riverside Drive, Cleveland, has plans for new hangar, 100 x 120 ft., with repair and reconditioning department, etc., reported to cost close to \$35,000.

Universal Crane Co. has removed its general sales offices from Cleveland to Twenty-eighth and Fulton Street, Lorain, Ohio.

American Fuel Economizer Corporation, 1100 Harter Bank Building, Canton, Ohio, has been formed to manufacture fuel economizer for high and low pressure boilers and to conduct engineering service to ascertain present efficiency of boilers. Company does not contemplate construction of new plant and purchases raw materials in open market.

St. Louis

ST. LOUIS, Aug. 20.—Century Electric Co., 1806 Pine Street, St. Louis, will proceed with construction by day labor on one-story foundry, 240 x 260 ft., at 3937 Market Street, to cost in excess of \$175,000, with equipment. E. S. Pillsbury is president.

City Council, St. Louis, has been authorized to arrange for bond issue of \$2,000,000, for establishment of municipal airport buildings and facilities, including hangars, machine and repair shops, oil storage and distributing buildings, and other mechanical units. City engineering department will be in charge.

Prest Machine Works, 303 East Grand Avenue, Oklahoma City, Okla., has awarded general contract to Reinhardt & Donovan Co., Tradesmen's National Bank Building, for one-story machine shop addition, 100 x 120 ft., for which superstructure will begin at once. Baldwin & Baldwin, Magnolia Building, are architects.

City Council, Lincoln, Neb., has sold bond issue for \$100,000, proceeds to be used for municipal airport, including hangars, repair and reconditioning shops, and other mechanical units.

Muskogee Iron Works, Frankfort and Spaulding Streets, Muskogee, Okla., has plans for new one-story foundry, 140 x 200 ft., reported to cost about \$35,000, with equipment. S. M. McManus is general manager.

Higgin Mfg. Co., 1820 Lydia Street, Kansas City, Mo., manufacturer of weatherstrips, screens, etc., has leased building at 505 West Twenty-fifth Street, and will occupy for expansion. Equipment will be installed at early date.

Radium Springs Water Co., 1316 Oak Street, Kansas City, Mo., is planning construction of new factory and plans

early purchase of sterilizing, bottling, conveying and other mechanical equipment.

Chicago

CHICAGO, Aug. 20.—Miscellaneous orders for machine tools are holding August sales at, or a trifle above, the July rate, making the last two weeks the best early August period a number of Chicago dealers have ever had. Farm implement manufacturers, though heavy buyers in recent months, are now in need of additional equipment, some of which is for special purposes. Gasoline engine builders are also in the market. Studebaker Corporation, South Bend, Ind., has made several small inquiries and contemplates issuing a large list at an early date. Nash Motors Co., Racine, Wis., is building a plant addition. Lists of the A. O. Smith Corporation, Milwaukee, and the Chicago, Rock Island & Pacific are active and orders are expected by the trade at an early date. Fresh inquiry is holding up well and it portrays a favorable outlook for the remainder of this month. Used machines are moving in fair volume and at good prices.

Leinert Valve Co., 310 South Michigan Avenue, Chicago, has received an order from one of the large steel companies in Germany for Leinert patented automatic plate valves for blast furnace blowing engines. The company also received orders from the same source for gas blowing engine piston rings of 1500 mm. diameter, 2000 meters of wire rope 1 11/32-in. diameter and 66,000 kg. tensile strength.

Plans are reported as being under way for the construction of a pipe line to supply El Paso, Tex., with natural gas from Winkler County, Texas, and Lea County, New Mexico.

International Harvester Co., 606 North Michigan Avenue, Chicago, will build factory addition, 180 x 510 ft., to cost \$170,000.

W. H. Hutchinson & Son, manufacturers of bottling machinery, will erect factory building on North Cicero Avenue, between Division and Augusta Streets, Chicago, representing an investment of \$250,000. Construction will be in charge of the Austin Co.

Wilson Steel Products Co., Chicago, will build a one-story plant, 93 x 100 ft. Fred A. Felder, 109 East Twenty-sixth Street, is architect.

Western Packing & Provision Co., 3830 South Morgan Street, Chicago, will install power equipment to cost \$200,000. B. K. Gibson, 3830 South Morgan Street, is architect.

Granger & Bollenbacher, 333 North Michigan Avenue, Chicago, architects, have preliminary plans for a two-story and basement automobile service, repair and garage building, 110 x 160 ft., at Evanston, Ill., to cost in excess of \$150,000 with equipment.

Toledo, Peoria & Western Railroad Co., Peoria, Ill., has work in progress on new engine house with repair facilities at East Peoria, Ill., to cost close to \$85,000 with equipment.

John Deere Harvester Co., Moline, Ill., has awarded general contract to J. H. Hunzinger Co., Security Building, Davenport, Iowa, for four-story and two-story addition to plow shop, estimated to cost in excess of \$200,000 with equipment.

City Council, Chicago, is considering establishment of municipal airport on Lake Michigan, foot of Madison Street,

including hangars, machine and repair shops, oil storage and distributing buildings, and other mechanical units, with entire project to cost more than \$5,000,000.

John W. Henney & Co., Freeport, Ill., manufacturers of automobile bodies, are said to be arranging for purchase of plant and business of Weatherproof Body Corporation, Corunna, Mich., and will consolidate with organization. Purchasing company is increasing capital from 100,000 to 125,000 shares, common stock, and from 25,000 to 50,000, preferred stock, no par value, portion of fund to be used for expansion.

Fox & Fox, 38 South Dearborn Street, Chicago, architects, will soon begin construction of five-story and basement automobile service, repair and garage building, 80 x 140 ft., at Eleventh and State Streets, estimated to cost in excess of \$150,000 with equipment.

Board of Education, Pekin, Ill., contemplates installation of manual training equipment in new two-story high school, estimated to cost \$325,000, for which plans are being prepared by Royer, Danely & Smith, Flat Iron Building, Urbana, Ill., architects.

R. B. Kurzon, 105 West Monroe Street, Chicago, architect, has filed plans for two-story automobile service, repair and garage building at 2546-58 South Michigan Avenue, 140 x 180 ft., to cost about \$100,000 with equipment.

Detroit

DETROIT, Aug. 20.—Contract has been let by Hupp Motor Car Co., East Milwaukee Street, Detroit, to Everett Winters Co., 1651 East Grand Boulevard, for eight-story and basement addition, reported to cost in excess of \$900,000, with equipment.

Bay City Rubber Co., Bay City, Mich., recently organized, has acquired former local plant of Wildman Rubber Co., and will occupy for manufacture of inner tubes and other rubber goods. New equipment to cost more than \$50,000 will be installed.

Pontiac Pattern & Engineering Co., Pontiac, Mich., is said to have plans nearing completion for one-story foundry, 70 x 80 ft., to cost close to \$25,000, with equipment.

Detroit Edison Co., Second Avenue, Detroit, will make extensions and improvements in automatic power switching stations at Marysville, Conners Creek, Waterman, Madison, Walker and other points, to cost more than \$1,500,000, with equipment.

General Motors Corporation, Detroit, will build one-story addition to plant at Walkerville, Ont., to be equipped primarily for manufacture of axles for Chevrolet and Pontiac automobiles, estimated to cost about \$85,000.

Walter O. Briggs, president of Briggs Mfg. Co., 11631 Mack Avenue, Detroit, manufacturer of automobile bodies, will be head of Verville Aircraft Co., recently organized as an interest of Briggs Commercial & Development Co., of which he is president. New company will specialize in light planes for commercial service, and plans early production in former plant of Rickenbacker Motor Co., Cabot Avenue, lately secured at receivership proceedings.

Grand Rapids Store Equipment Co., Grand Rapids, Mich., recently formed by merger of Grand Rapids Show Case Co. and Welch-Wilmarth Corporation, has plans nearing completion for addition to

local plant, reported to cost more than \$75,000. Company will also carry out expansion and improvements at Portland, Ore., plant and is projecting plans for new branch on site to be selected in Texas.

United Steel & Wire Co., Oakland Avenue, Battle Creek, Mich., has awarded general contract without competition to F. J. Skidmore, 59 Guest Street, for new two-story addition, to be equipped largely for storage and distributing service, reported to cost in excess of \$40,000.

Consumers Power Co., Jackson, Mich., will build two new units to steam-operated electric generating plant at Saginaw, Mich., to cost more than \$2,500,000. A new automatic power substation will be built in same city to cost approximately \$200,000.

Wayne County Board of Supervisors, Detroit, has selected tract of land on Pennsylvania Road, about 12 miles from city, as site for new Wayne County Airport, to include construction of hangars, repair and reconditioning shops, oil storage and distributing buildings, and other mechanical units. Entire project is reported to cost more than \$1,000,000.

Monroe Steel Castings Co., Monroe, Mich., has installed Tate-Jones low-pressure, oil-fired, car-type annealing furnace. Car is 6 x 15 ft., with load capacity of 15 tons. Furnace is automatically controlled and is housed in addition built for purpose.

Cincinnati Ball Crank Co., Cincinnati, Ohio, on Sept. 1 will open an office at 10-253 General Motors Building, Detroit, for distribution of automotive parts.

Milwaukee

MILWAUKEE, Aug. 20.—Production of machine tools continues at an unusually high level for the season, and new business is developing in a satisfactory way. Local shops which are engaged in plant enlargement have placed the bulk of their needs, but still have some purchases to make to round out the new tooling. Inquiry from other centers is fairly active and the outlook for continued good demand is undisturbed. Complaint of a shortage of skilled machinists is general.

Globe Steel Tubes Co., 1345 Burnham Street, West Allis, Milwaukee, is starting construction work on rolling mill addition, 110 x 240 ft., one story, to cost about \$50,000. It is to be ready Oct. 1. Frank J. O'Brien is president and general manager.

National Lumber & Creosoting Co., Superior, Wis., has commissioned Roland C. Buck, Inc., local consulting engineer, to design new plant estimated to cost from \$200,000 to \$300,000. Equipment will include boring and perforating machinery, locomotive crane, gasoline locomotive, etc. George P. Rex is vice-president in charge.

Aluminum Goods Mfg. Co., Manitowoc, Wis., contemplates erection of manufacturing addition to its plant at Two Rivers, Wis., to cost \$450,000 complete. Plans are being drawn by Lockwood, Greene & Co., 400 North Michigan Avenue, Chicago. George Vits is president.

Belle City Malleable Iron Co., Racine, Wis., is erecting addition, 77 x 100 ft., to its annealing building. C. S. Anderson is general manager.

MotoMeter Co., Long Island City, N. Y., has decided to defer until early next year the proposed enlargement of its

Western division, National Gauge & Equipment Co., LaCrosse, Wis., according to P. M. Gelatt, president of the division, upon his return from a visit to the general offices.

Wesley Steel Treating Co., 651 South Pierce Street, Milwaukee, is building a one-story fireproof addition, 45 x 51 ft., according to plans by Siebert & Kegler, architects, 230 Wisconsin Avenue, local. Charles I. Wesley is president.

A. J. Simonds, Dayton Co., Dayton, Ohio, manufacturer of cutlery, etc., has acquired controlling interest in R. J. Dowd Knife Works, Beloit, Wis., established in 1857. Enlargement of the Beloit plant is in early prospect. G. A. Dowd is general manager.

Seaman Body Corporation, Milwaukee, plans to install power equipment in connection with additions to its automobile body manufacturing plant. This company is a subsidiary of the Nash Motors Co., Kenosha, Wis.

Follen-Strom Mfg. Co. has purchased a new plant in Kenosha, Wis., where it will continue to make check and bond perforating machines.

Gulf States

BIRMINGHAM, Aug. 20.—Bids will be received by M. G. James, city secretary, Dallas, Tex., until Sept. 7 for power and pumping machinery for municipal waterworks, including two 1000 kw. turbo-generators, complete with accessories; three 300 hp. watertube boilers with auxiliary equipment; two turbine-driven pumping units with rated capacity of 15,000,000 gal. per day, with accessories; and three motor-driven pumping units with capacity of 15,000,000 gal. per day, with accessories; also, for water purification plant with capacity of 32,000,000 gal. daily, including filter piping and accessories. Plans and specifications for latter at office of David Morey, Jr., Praetorian Building, engineer. J. B. Winder, chief engineer of water department.

Board of Commissioners, Mobile, Ala., is asking bids until Sept. 4 for equipment for municipal waterworks, including two 150,000-gal. steel tanks on 75 and 100-ft. towers, respectively; two 100,000-gal. steel tanks, on 75 and 100-ft. towers; and 60,000-gal. tank on 75-ft. tower. Wright Smith is city engineer in charge.

City Commission, Jacksonville, Fla., will receive bids on revised plans on Aug. 27 for municipal machine and repair shop, and service and garage building on West Third Street, reported to cost in excess of \$65,000, with equipment. Bids recently received have been rejected.

Moody-Seagraves Co., Esperson Building, Houston, Tex., is at head of project to construct and operate a 16-in. pipe line from Winkler County, Tex., and Lea County, N. M., adjoining, to El Paso, Tex., and vicinity, about 220 miles, for natural gas supply, reported to cost more than \$2,000,000.

City Council, Oxford, Miss., is asking bids until Sept. 4, for a municipal power plant, and for 2-ton hand-operated traveling crane (recently incorrectly noted in these columns as electric-operated). Frank P. Gates, Edwards Hotel Building, Jackson, Miss., is architect and engineer.

Power equipment, conveying machinery, forced draft equipment and other mechanical equipment will be installed in new packing plant to be erected by Texas Citrus Fruit Growers' Exchange, San Benito, Tex., to cost about \$100,000.

Daltex Spring Bed Co., Dallas, Tex., recently formed by Lyle Marshall, 4905 Swiss Street, and associates, plans early operation of local plant for manufacture of metal bedsteads, springs, etc.

Cincinnati

CINCINNATI, Aug. 20.—Contract has been let by Armleder Motor Truck Co., John and Exeter Streets, Cincinnati, to Frank Hill Smith & Co., Winters National Bank Building, Dayton, Ohio, for one and three-story addition, to cost close to \$100,000 with equipment.

Wilson-Weesner-Wilkerson Co., 422 Front Street, Knoxville, Tenn., manufacturer of contractors' equipment, has plans for new one-story plant, totaling about 10,000 sq. ft. floor space, with storage and distributing unit adjoining, reported to cost approximately \$30,000 with equipment.

Board of Education, Jackson, Tenn., is considering installation of manual training equipment in new three-story and basement high school, estimated to cost \$230,000, for which bids are being asked on general contract until Aug. 27. R. A. Heavener, K. C. R. Building, is architect.

Ohmer Fare Register Co., Dayton, Ohio, is planning production on large scale of new type of ticket printing register for transportation companies, recently invented by John F. Ohmer, president, and will arrange increased facilities for this purpose.

Air Corps, Material Division, Wright Field, Dayton, Ohio, is asking bids until Aug. 27, for quantities of clevis bolts, castle nuts, shear nuts, cowl pins, shackles, studs, turnbuckle assemblies, union nuts, washers, etc., circular 79; for quantity of conduit, cable and wire, circular 85.

R. E. Franklin, commissioner of public utilities, Jackson, Tenn., is asking bids until Sept. 11 for a motor-driven centrifugal deep-well pump, with controls and accessories, as per specifications at office of E. R. Dike, city engineer.

Board of Shelby County Commissioners, Memphis, Tenn., will soon begin construction of general mechanical works, machine shop, and work house, 75 x 260 ft., at Mullins Station, for county equipment, reported to cost in excess of \$100,000 with equipment.

Board of Education, Bowling Green, Ky., is considering installation of manual training equipment in proposed new junior high school, reported to cost in excess of \$250,000, for which plans will be drawn by Marr & Holman, Stahlman Building, Nashville, Tenn., architects.

Indiana

INDIANAPOLIS, Aug. 20.—Additions to cost approximately \$40,000 are being made to plant of Federal Foundry Co., Indianapolis, maker of stove castings and subsidiary of American Stove Co., St. Louis. Improvements include added shipping rooms, machine shops, sand storage bins and other storage facilities.

Portion of former plant of Midwest Engine Co., Nineteenth Street and Martindale Avenue, Indianapolis, has been leased by Eaglesfield-Link Co., Brazil, Ind., manufacturer of woodworking machinery, and new plant will be established. Heretofore company has had its machinery manufactured in outside shops, and will use new works primarily for

assembling plant, with proposed later development to include castings and parts manufacture. For present, foundry work will be given out on contract. Dick Link is president; R. D. Eaglesfield is vice-president.

Bastian-Morley Co., Laporte, Ind., manufacturer of water heaters, parts, etc., has acquired land on East Fifty-ninth Street, near Central Avenue, Los Angeles, and will have plans drawn for a Pacific Coast branch factory, reported to cost more than \$50,000 with equipment. S. J. Lonergan is vice-president in charge of production.

Smithfield Township Board of Education, Waterloo, Ind., contemplates installation of manual training equipment in two-story addition to high and grade school at Ashley, reported to cost in excess of \$300,000. E. I. Brown, First National Bank Building, Fort Wayne, Ind., is architect.

City Council, Anderson, Ind., has authorized purchase of tract of 160 acres of land for municipal airport, and will build hangars, repair and reconditioning shops, oil storage and distributing buildings. A fund of \$75,000 has been voted for project.

Studebaker Corporation, South Bend, Ind., manufacturer of automobiles, has awarded general contract to H. G. Christman & Co., 306 Notre Dame Street, for two-story engineering building unit, 240 x 432 ft., reported to cost in excess of \$200,000 with equipment. Albert Kahn, Inc., Marquette Building, Detroit, is architect.

Wheeler-Schebler Carburetor Co., Inc., 1302 Barth Avenue, Indianapolis, manufacturer of automobile accessories, has acquired adjoining property, 130 x 140 ft., and will raze present buildings on site for new one-story addition, reported to cost more than \$50,000 with equipment.

Pullman Car & Mfg. Co., Pullman, Ill., is arranging for removal of its entire engineering department to branch works at Michigan City, Ind., early in September.

Pacific Coast

SAN FRANCISCO, Aug. 17.—Los Angeles Ladder Co., 1630 South Central Avenue, Los Angeles, manufacturer of ladders, hardware products, etc., has awarded general contract to L. R. Armstrong, 144 Glendale Boulevard, for new one-story plant, 150 x 160 ft., on Alameda Street, to cost close to \$40,000 with equipment.

Pacific Gas & Electric Co., 245 Market Street, San Francisco, has made application for permission to issue preferred stock in amount of \$10,000,000, of which about \$3,500,000 will be used for expansion and improvements in power stations and system.

Arizona Edison Co., Douglas, Ariz., is planning construction of new steam-operated electric power plant at Naco, Ariz., to cost more than \$100,000 with transmission lines. Company will also build a power substation, and ice-manufacturing plant at Lowell, Ariz., to cost in excess of \$75,000.

Safety Step Ladder Co., Spokane, Wash., has filed plans for a new factory at 3301 East Sprague Street.

City Council, Los Angeles, has taken lease on Mines' Field, near Inglewood, as site for municipal airport, and has appropriated \$300,000 for development, to include hangars, machine and repair shops, oil storage and distributing buildings, etc.

Central Arizona Light & Power Co., Phoenix, Ariz., is having plans drawn for two-story equipment storage and distributing plant on South Third Avenue, with repair and mechanical facilities, estimated to cost \$100,000 with machinery. Lescher & Mahoney, Phoenix, are architects.

A Seattle firm, the name of which has not yet been publicly announced, has taken a tract of land in Brooklyn district, the industrial section of Portland, with the idea of building a \$250,000 plant within eight months, according to Dorr E. Keasey, of Keasey, Humason & Campbell, real estate dealers, who handled the transaction. The plant will be used to make logging and railway equipment and steel tanks. The site cost \$30,000.

Canada

TORONTO, ONT., Aug. 20.—Demand for machine tools continues steady and the volume of new business in prospect continues to grow. Current demand is mostly for single tools, with a few orders appearing at intervals for as many as half a dozen tools. A number of lists are being prepared and are expected to appear about the first of next month for equipment for new industrial plants now under construction. Present demand is of a diversified nature and is from many parts of the country. The demand for small tools has been showing improvement of late. Inquiries and sales are reported in better number from the mining fields.

Gale Iron Works, Ltd., A. W. Lau, manager, is asking for prices on equipment for the manufacture of steel sash, pressed steel stairs and ornamental iron work, to be installed at its recently acquired plant at Petrolea, Ont.

Canadian General Electric Co., head office, Toronto, Ont., has awarded contract to R. Sheehy & Sons, 751 George Street, Peterborough, Ont., for the erection of unit No. 1, of addition to its plant at Peterborough, Ont. Bids are now being received by E. G. Paterson, local plant superintendent, Canadian General Electric Co., Park Street, Peterborough, Ont., for the construction of unit No. 2.

Canadian Hydro-Electric Corporation, Gatineau, Que., will start work immediately on construction of a sub-station to cost \$275,000. C. Glidden is engineer.

Gatineau Power Co., subsidiary of the Canadian Hydro-Electric Corporation, Gatineau, Que., proposes to build switching station at Hull, Que., to cost \$275,000.

New Brunswick Power Co., Dock Street, St. John, N. B., has awarded contract to Sanderson & Porter, New York City, for addition to plant on Dock Street there to cost \$760,000, including equipment.

Wyndels Construction Co., Ltd., 654 Aulneau Street, St. Boniface, Man., has been awarded contract for addition to plant of Dominion Wheel & Foundries, Ltd., Archibald Street, St. Boniface, Man. Building to cost \$10,000.

Foreign

PLANS have been approved by General Motors Export Co., General Motors Building, Detroit, operated by General Motors Corporation, same address, for new assembling plant at Bombay, India, to be equipped for initial output of 100 complete automobiles per day, reported

to cost more than \$400,000 with equipment. General Motors India, Ltd., has been organized as subsidiary to carry out project, which is scheduled for completion by end of year.

Embanef Oil Syndicate, Moscow, Russia, operated under direction of Soviet Russian Government Co., is planning construction of new refining plant at Samara, on Volga River, with capacity of about 200,000 tons per year. Amtorg Trading Corporation, 165 Broadway, New York, official buying agency of Soviet Russian Government, has information regarding project.

Town Council, Johannesburg, South Africa, has authorized a fund of about \$2,400,000 for municipal expansion and improvements, including extensions in municipal power department with installation of steam turbo-generating sets and auxiliary equipment; construction of automatic power substation; underground conduit system; sewage disposal works, with pumping machinery and other mechanical equipment; and cold storage and refrigerating plant.

Secretary of Public Works, Supply and Tenders Board, Wellington, New Zealand, is asking bids until Oct. 30 for 110,000-volt transformers, 11,000-volt potential transformers, control panels, control cables, spare parts, etc., as per specifications on file.

South Manchuria Railway Co., Peking, China, is perfecting plans for early construction of new steel mill at Anshan, Manchuria, for manufacture of steel bars, black sheets, railway sleepers, steel poles, and other iron and steel products used in railroad construction and operation.

Koninkijle Nederlandsche Hoogovens en Staalfabriek, in IJmuiden, Netherlands, operating an iron and steel works, is perfecting plans for early construction of a new nitrogen plant, to be operated in conjunction with existing mills. It is purposed to organize a subsidiary company to carry out enterprise. The unit will be equipped for production of ammonia as a by-product of coke-oven gas, with equipment for combining synthetically with nitrogen from air for commercial fertilizer production.

New Trade Publications

Electrical Devices.—Crouse-Hinds Co., Syracuse, N. Y. Bulletin G-2, dealing with groundlets and other safety circuit devices, and Bulletin G-8, describing and illustrating installations in wiring methods.

Foundry Cupola Flux.—Mathieson Alkali Works, Inc., 250 Park Avenue, New York, in a 32-page pamphlet with the title "Why Purite?" presents a series of full-page illustrated expositions of the application of its product. Purite, which is described as a development from the commercial production of sodium carbonate, or soda ash, in fused form, is employed in the foundry cupola as a flux. The text refers to its basic properties, its low melting point and its high chemical activity at cast iron temperatures.

Ventilating and Metering Equipment.—P. H. & F. M. Roots Co., Connersville, Ind. Bulletin 40-B2, dealing with the company's new positive displacement meter. Units are built in sizes with hourly capacities ranging from 100 to 1,000,000 cu. ft. per hr., and are adapted to pressures up to and including 100 lb. per sq. in. Bulletin 10-B1 is of general nature, covering blowers, gas pumps, boosters, exhausters, liquid and vacuum pumps, meters and accessories.

THE IRON AGE

New York, August 30, 1928

ESTABLISHED 1855

VOL. 122, No. 9

Metals Studied for Fifteen Years

Review of Achievements Since Organization of Metallurgical Division of Bureau of Standards in 1913—Much Effort Put on Developing Correct Methods of Test

BY H. W. GILLET^T*

IN 1926 the Bureau of Standards celebrated its twenty-fifth anniversary. It was a dozen years after the foundation of the bureau before its metallurgical work became grouped in a separate division, even though sections of various divisions, such as those dealing with pyrometry, were already dealing with problems of metallurgical interest.

The original six divisions of the bureau dealt with electricity, weights and measures, heat and power, optics, chemistry and mechanics, and were indeed organized with the idea of serving all industries concerned with those subjects.

The metallurgical and two other technical divisions of the bureau that were set up later were organized on a somewhat different basis. They are not so much concerned with absolute standards of measurement or facts relating to a particular science as they are with the application of known facts and the finding of new facts of interest to the industries they serve.

Dr. S. W. Stratton (then director of the Bureau of Standards, but now president of the Massachusetts Institute of Technology) selected Dr. George K. Burgess as the chief of the new division. The latter had been working for 10 years on pyrometric problems of very direct metallurgical interest. Trained both as a chemist and a physicist, he had become, from his own

interest in the metallurgical field, a metallurgist as well. He guided the destinies of the new division until he became director of the whole Bureau of Standards in 1923.

Fifteen years have now passed since the metallurgical division was formed. Instead of confining discussion merely to the fiscal year as has been customary in recent reports made to the metal industries through the pages of *THE IRON AGE*,¹ it is proposed to review some of the basic ideals that have guided the division for the past 15 years and some of the accomplishments of that period.

Funds Are Stationary

Obviously the scope of the work is limited by funds, personnel and equipment. For the past few years the direct appropriation, the funds transferred from other Government departments and the overhead expenditures for general bureau purposes have totaled about \$125,000 yearly for the metallurgical division. About this same amount will be available for 1928-29. Since the funds have remained practically stationary for several years, so has the personnel of the division.

Researchers Average Eight Years at Bureau

The division staff consists of 26 employees of professional grade qualified to do research, a small number of research associates (probably four for the coming year), 10 sub-professional assistants, a clerical staff of three and a machine shop staff of three. That is, the group consists of 45 workers.

As a rule there is a rather rapid turn-over of the staff

Figure 1—Improved Apparatus for Determining Gases in Metals by Vacuum Fusion. This provides for the determination of oxygen and hydrogen in a metal either gravimetrically or volumetrically, the analysis being made with circulation of gases by a mercury diffusion pump; the determination of nitrogen volumetrically; the melting of the sample under high vacuum; the loading of the furnace without relieving the vacuum

*Chief, Division of Metallurgy. Published with the approval of the director of the Bureau of Standards.

of a Government laboratory. Yet the 38 technical and clerical employees now on the staff of the metallurgical division have served there an average of six and one-half years. Six have been on the staff over 10 years. The average length of service of the 26 in the professional grade is about eight years.

Two-thirds of the entire experience gained in the work of the division is still being brought to bear on Government work, and over half of it is still available within the division. While most of the staff have spent the better part of their careers in research, they have previously done metallurgical work for 18 different firms.

Much Special Equipment Constructed

In the 15 years of its existence the division has bought much standard equipment. It has various types of electric, gas and oil furnaces and a cupola for melting steel, cast iron and the non-ferrous metals; foundry equipment, extensive furnace equipment for heat treatment and for pyrometric control of the furnaces; a forging press, a trip hammer, a 16-in. rolling mill, two small mills for special work, wire-drawing equipment, with a range from 1½ to 0.001 in. in diameter; two swaging machines with a range of 0.4 to 0.03 in. and a lathe for spinning. Alloys can therefore be made and formed as needed. The division has a variety of tensile testing machines, hardness testing devices, and other common testing machines of its own, besides easy access to the very complete equipment in the engineering mechanics section of the bureau. An especially complete set is available for the study of endurance of metals.

Besides the equipment for study of crystal structure

by X-ray methods, both slit and pin hole, and a densitometer for further study of the X-ray films, the fine radiographic equipment of the optics division has recently been augmented to make radiographs for study of defects in metals. The extensive metallographic equipment has also been augmented by a heavy microtome for preparing soft metals. A mechanical polishing apparatus has also been constructed.

In its particular fields of work it has constructed much special equipment, such as that for study of corrosion, of properties of metals at high temperatures, including bearing metals; for determination of gases in metals and for the production of the special refractories needed in that work and in the study of the properties of pure metals; for determination of critical points and for study of cooling during quenching; for the study of the metal spray process; for study of molding sand and core binders; for study of machinability and the wear of metals.

Individual Attention Given to 3600 Inquiries Yearly

Although sufficient funds, an experienced staff and complete equipment are important, little constructive work will be done by any laboratory unless this work is directed along proper lines and from the proper point of view. First and foremost, the division gets the guidance of Director Burgess, whose long service in metallurgy makes him especially conversant with its problems. Receipt every year of some 3000 letters and of visits from some 600 people asking for metallurgical information gives some idea of the type of information that is needed. For example, such a large proportion of these inquiries deals with the wear of metals that there can be no question of the need for work in that field.

The meetings of the metallurgical advisory committees, at which in 1928 over 60 practising metallurgists spent two

Figure 3—Machine for Repeated Pounding of Bearing Metals

The weight A is repeatedly raised by the mechanism D and dropped on the specimen B mounted on the anvil C. The mechanism F is to prevent auxiliary blows associated with the rebound of the falling weight. Tests at high temperatures are made by placing the furnace E about the specimen

days discussing with the bureau staff what had been done in the previous year and what should be done in the next, are of great service in orienting the work.

A Plant to Produce Information

The product of these men and this plant is metallurgical information. A small proportion of such information is for routine needs of Government departments; much is in the form of replies to inquiries, but the great bulk of the work is on research for publication. The list of metallurgical publications of the division itself has over 400 titles.

Some of the larger projects of the last year are: wear testing of gages, wear and other properties of railroad bearing metals, endurance of rail steel, creep in steel at high temperatures, corrosion test methods, air-hardening rivets, machinability of steel, impurities in high-speed steel, corrosion of duralumin, abnormal carburizing steel, determination of gases in metals, density of carbon steels, crystal structure, microstructure of ferrite, strain lines, protective

metallic coatings, cast iron for enameling, and an extensive revision of the circular on light alloys, besides many minor publications.

Research Associates Utilize Facilities

Inasmuch as there has been no material change in the funds available for research for the past five years and there is a slight diminution for 1928-29, the "research associate plan," by which outside agencies pay the salaries of research associates for cooperative work at the bureau, is the only method by which the available equipment and experience can be applied to a wider range of problems. Six research associates are now in attendance. These are from the American Petroleum Institute, on corrosion of metals in the oil industry; from the American Zinc Institute, aiding in the preparation of a circular on zinc; from the Steel Castings Development Bureau, on properties of steel castings; from the Bunting Brass & Bronze Co., on automotive bearing metals; from the A. M. Byers Co., on properties of wrought iron made by different puddling processes; and from the Midvale Co., on high temperature properties of special steels. This

number could be materially augmented.

Important Achievements of 15 Years

Since all the work of the past 15 years has been aimed to fill the need of science and industry for new facts and most of the problems have been urged by technical societies or groups representing industry, most of the work should have been of some commercial value.

Some accomplishments deserve special mention. The work of Burgess and co-workers (and in all that follows the co-workers deserve credit which space is lacking to give) on pyrometric problems, on the A_2 point in iron, on the manufacture of platinum of high purity, and on sound in-

Figure 5—Top View of Automatic Polishing Machine for Metallographic Specimens

Rapidly rotating disk polishes three specimens simultaneously. Slowly moving cam at center traverses specimens across disk and also rotates them to avoid parallel scratches

got's and rails, certainly should be mentioned. Burgess' leadership in the important cooperative work on the effect of phosphorus and sulphur in steel is also well known.

Perhaps the most far-reaching bit of work done in metallurgy at the bureau was that of Merica, Waltenberg and Scott on the mechanism of the heat-treatment of duralumin, which paved the way for an understanding of precipitation-hardening and for the slip-interference theory. Jeffries and Archer have also utilized facts about the dimensional changes of steel on hardening from the work of Scott, and on the hardening of spark-fused iron from the work of Rawdon, as foundation stones in the structure of the theory of the hardening of steel. Merica and Waltenberg straightened out the problem of the malleability of nickel. Merica also added much to the understanding of internal stress and season-cracking of brass. Scott's work on the effect of nickel on the critical points of steel is also of fundamental value.

Rawdon has contributed much to knowledge of inter-crystalline corrosion, and (with Groesbeck) of metallographic methods. The work of Rawdon and Marshall on brittleness in galvanized malleable castings has had useful commercial application. Epstein's work on abnormal steel is highly creditable.

French has done pioneer work on the high-temperature properties of metals and methods of testing, has added materially to knowledge of methods for testing tool steels and machinability, and has done constructive work on wear testing and on gages. French and Klopsch's work on the mechanism of the quenching of steel has been practically applied by Smith to improve the product of the bolt industry.

Freeman has shown the alleged allotropy of zinc to be non-existent and has added to our knowledge of the properties of babbitt metal and of the endurance of rail steel.

Cain has worked on the Ledebur method for oxygen in steel and Jordan has brought close to perfection the vacuum fusion method for determining oxygen, hydrogen and nitrogen in steel and cast iron.

The work of Neville and Cain on the pure iron-carbon-manganese alloys has served as a baseline for the study of the influence of other elements in steel. The successful working by Jordan and Swanger of pure rhodium into wire

Figure 4—Brinell Wear Testing Machine

Possible application of this machine to shovel materials is now being studied. Sand from reservoir H is fed through hopper H and dragged past specimen S under pressure from weight F by wheel W

has made possible decided improvements in apparatus used by other divisions of the Bureau of Standards.

Saeger has developed methods of testing molding sand for permeability, compression and sintering point. His recent work on rubber as a core bond also deserves mention in any such list. His studies on metal spray led the metallurgical division to try to protect duralumin against corrosion and intercrystalline embrittlement by a coating of pure aluminum, a scheme recently commercialized. In the same connection, Rawdon proved the importance of cold water quenching of duralumin itself as a means of minimizing intercrystalline attack.

In looking back at this research work it is noteworthy that important advances in theory have resulted from work undertaken for purely practical purposes, and vice versa. It is the writer's belief that the distinction between "practical" and "fundamental" (i.e., theoretical) research is an artificial one and that search for experimental facts and the reasons for them is no less "fundamental" because it

happens to have angles of immediate practical importance. Nor should a question apparently of pure theory be avoided because it does not show immediate practical angles.

Present and Future Work

Most of the present work is concentrated upon fields in which the bureau has previously been working and whose importance seems demonstrated.

In all of it as much stress is being laid on the development and appraisal of suitable test methods as on the obtaining of data by those methods. Once superior methods are available, which really tell what one wants to know, producers and users will apply them to the materials they make or use, and the needed data will rapidly be collected. But in many of these fields industry is not getting these data for lack of suitable tests. It seems of more importance to the metallurgical public that the bureau concentrate on test methods rather than on getting masses of test data.

Hot Blast Invented One Hundred Years Ago

ON Sept. 11 there will be celebrated in Glasgow, Scotland, the centenary of one of the most remarkable inventions. On this day, 1828, there was granted to J. B. Neilson, a city gas works manager, patent No. 5701 for "improved application of air to produce heat in fires, forges, and furnaces where bellows or other blowing apparatus are required."

Extracts from the original specification show that Neilson had in mind the principles of good combustion and fuel economy rather than their application to any particular case.

"A blast or current of air must be produced by bellows or other blowing apparatus in the ordinary way. . . . The blast or current of air so produced is to be passed from the blowing apparatus into an air vessel or receptacle, made sufficiently strong to endure the blast, and through and from that vessel, by means of a pipe, tube or aperture, into the fire, forge or furnace. . . . At the commencement and during the continuance of the blast it (the vessel) must be kept heated artificially to a considerable temperature. It is better that the temperature be kept to a red heat or nearly so, but so high a temperature is not absolutely necessary to produce a beneficial effect. The air vessel or receptacle may be conveniently made of iron, but the effect does not depend on the nature of the material. . . . The form or shape of the vessel or receptacle is immaterial to the effect, and may be adapted to the local conditions or circumstances. The air vessel may generally be conveniently heated by a fire distinct from the fire to be affected by the blast or current of air, and generally it will be better that the air vessel and the fire by which it is heated should be inclosed in brickwork or masonry, through which the pipes or tubes connected with the air vessel should pass. The manner of applying the blast to the air vessel is, however, immaterial to the effect if it be kept at a proper temperature."

The far reaching effects of this invention on the iron industry and prosperity of the world in general have frequently been described. It marked the first step in fuel economy and consequent high output of blast furnaces; these in turn have given the world cheap iron and steel.

Stimulated Scotch Iron Making

The immediate effects of hot blast as applied to the early nineteenth century blast furnaces were truly astound-

ing. In 1829 a stove was built at the Clyde Ironworks, giving a preheat of only 300 deg. Fahr., but this resulted in the coal consumption (as coke) being reduced from 8.05 to 5.15 tons per ton of pig, together with a greatly increased output. By 1833 the blast temperature had been raised to 600 deg. Fahr. and the coal consumption (now fed into the furnaces raw to avoid heavy coking losses) had come down to 2.25 tons per ton of pig. It was not until some years later that Faber du Faur's idea (patented in 1832) of using the waste gases from the furnace to heat the blast came into general use, so the above figures include the raw coal burned under the stoves. In practice it was found that 250 lb. of coal burned under the stoves saved a ton of coal in the charge.

The resulting growth of the iron trade in Scotland following the general adoption of Neilson's patent is another indication of its importance. In 1830 the total output of all furnaces was only 37,500 gross tons, but by 1840 this had increased to over 200,000 tons.

A Product of "Industrial Research"

The invention was not a "shot in the dark," but the outcome of scientific observation and reasoning. J. B. Neilson, the son of an engine wright, was a self-educated man. After serving his apprenticeship with the firm that employed his father, he took work at the City Gas Works, Glasgow. Studying in his spare time as best he could, he rose to foreman and finally to manager. In this position he was able to establish one of the earliest industrial laboratories for works control and training his men. It was while experimenting here that he realized the importance of preheated air in combustion, though it is improbable that he realized at the time how far reaching his discovery would be. That its most important application came in another industry illustrates again the value of a sound scientific education with its wide and fruitful results.

"The Employment Interview" is the title of the second of a series of manuals of employment practice, which is being issued by the Policyholders' Service Bureau of the Metropolitan Life Insurance Co., New York. Methods of various companies in conducting hiring interviews are outlined in the booklet, and of particular interest is the policy of the Curtis Publishing Co., Philadelphia, in emphasizing the undesirability of over-stressing the good features of the job.

Carbonizing Dodge Parts Electrically

Parts Quenched from Pot Given 10½ to 16½ Hours' Heat
in Turret Furnace—Pot-Cooled Parts Stay Twice as
Long in Straight-Line Counterflow Furnace

IN a previous article, published in THE IRON AGE Aug. 16, page 389, it was noted that nearly all heat treating operations in the Detroit plant manufacturing Dodge motor cars have been electrified. Not only are forging and finished parts heated electrically, but carburizing is done in special types of furnaces, heated with electrical resistors. The latter equipment will now be described.

It should be understood that this modern installation does all the case hardening required, with the exception of those parts which are heated in cyanide, either for superficial case or merely for a heating out of contact with air. For such purposes 40 oil-fired cyanide pots of conventional type are retained. Parts which are quenched from the box are carburized in furnaces with rotary hearths. Work that is box-cooled is done in counterflow or recuperative furnaces, thus saving considerable heat energy.

Rotary Electric Furnaces

All parts that are to be quenched from the box at carburizing temperature are treated in three rotary-type furnaces built by the George J. Hagan Co. These are 26 ft. 3½ in. in outside diameter, 13 ft. 2 in. high above floor level and extend 5 ft. 8 in. below floor level.

The outside diameter of the rotating table is 22 ft. 8 in. and its inside diameter 12 ft.; its total loaded weight is between 60 and 70 tons. This hearth is supported by 91 1½-in. balls riding in a hardened gear race and supplemented by eight dead eyes and rollers riding on a circular track. The table is connected with a shaft projecting through the center of the furnace, on which is mounted a 6-ft. driving gear. A 1-hp. 220-volt motor, operating through a Foote Brothers speed transformer, gives a predetermined table speed of 10½, 13½ and 16½ hr. per revolution respectively in the three furnaces.

The table is equipped with 27 alloy bucks or piers equally spaced, 26 of which are active, the twenty-seventh being either unloading or loading. (These bucks support the

work 7 in. above the hearth, allowing the heat to strike the under side of the boxes. This elevated position also facilitates loading and unloading). Thus the time cycle is divided among 26 parts in the heated zone and one part for discharging and charging one pier of carburizing boxes.

After removing the hot boxes of carburized charge, the furnace operator presses the motor control button and moves the table forward until the empty buck automatically stops and indexes in front of the charging door. A baffle wall between the discharge and charging doors insulates the incoming from the outgoing boxes.

A lift-platform electric truck is used for loading. It brings five carburizing boxes from the loading platform. The truck moves into position in front of the charging door, its arms carrying the boxes are raised to the proper level, a compressed air cylinder opens the door and the truck moves forward, the arms straddling the pier. The arms are then lowered, depositing the boxes on the pier, and the truck backs away.

An interesting detail is the construction of the three-piece carburizing boxes, 11½ x 16 x 8¾ in. in dimensions. They have cast corners and

rolled alloy sides that are cast into the corners. The Dodge company finds that with this type less breakage occurs than with the more conventional cast boxes. Boxes are made of Q-alloy or a nichrome heat-resisting alloy.

Direct Labor Reduced One-Half

Each rotary furnace requires 500 kw. in five 100-kw., 220-volt, three-phase circuits arranged for three-point control. Settings on three Leeds & Northrup recorders control these circuits through their respective thermocouples; limit stops on these recorders actuate relays that control the power input switches. The first thermocouple, approximately 10 ft. from the loading door, controls two circuits and is set for 1725 deg. Fahr. The second, controlling two circuits, is at approximately one-half the travel and is set at

Fig. 1—Double-Ended Counterflow Carburizing Furnace. Two pot loads of ring gears on a single tray about to be charged into furnace

1700 deg. Fahr. The third is close to the discharge door and is set for 1650 deg. Experience in the Dodge plant has shown that the higher temperatures on the charging side reduce the heating portion of the cycle without danger of overheating the work. A saving of approximately 1½ hr. has been made in the cycle by this arrangement. Heating elements suspended from both side walls are 80:20 nickel-chromium ribbon operating at a density of approximately 8 watts per sq. in., giving a maximum temperature on the ribbon of approximately 100 deg. Fahr. higher than the furnace atmosphere as registered by the thermocouple.

These three furnaces produce the work that formerly required 26 oil-fired 10 x 11-ft. furnaces. While the heat cost is somewhat higher, it is stated that the direct labor cost of the furnace operation has been reduced one-half and that the quality of work produced approaches the ideal condition, i. e., uniform penetration of carbon and no rejects.

Hot carburizing boxes are carried from the furnace by the electric truck to motor-operated dumping machines located back of the furnaces. The box is clamped to the machine and inverted, dumping the contents on a screen, through which the carbonizing compound falls. The work slides down the screen into an oil bath.

Counterflow Carburizing Furnaces

Camshaft, ring gears, pinions and some miscellaneous parts are box-cooled. Such parts are carburized in seven counterflow-type furnaces of 159-kw. capacity, built by the Electric Furnace Co. These furnaces are 71 ft. long and have a hearth 72 in. wide, with no dividing wall. Fig. 1 shows the end door. The furnace is "double-ended," that is, it is loaded and discharged from both ends.

Furnace 11, for instance, is loaded from the near end (Fig. 1) and unloaded from the far end. Furnace 12 (not separated from No. 11 in any way) contains a row of pots moving in the opposite direction. The rows of boxes are pushed forward at a predetermined rate from opposite di-

rections, so that the discharge end of one row is alongside the charging end of the other. With this arrangement the cold boxes absorb heat as they enter from the hot boxes passing by on the other rollers.

Of the 71-ft. furnace length the preheating zone at either end is 16 ft. long. Next comes 6½ ft. of heating zone, and in the center is the holding zone, 26 ft. in length. The power for the holding zone is 49 kw. and for each heating zone 55 kw. These three zones are separately controlled, and are powered top and bottom with T-grid elements. Current is transformed from a 220-volt, three-phase circuit, a single-phase to each zone, to obtain the required current density on the heating element. Fig. 2 shows the automatic control operating from Leeds & Northrup recorders.

Packing and discharging is done on roller tables at the side of the furnaces shown in Fig. 3. As shown at the left, the boxes are packed with work and carbonizing compound and a tight-fitting cover is placed. Then the box is moved forward into a roll-over device and emerges on the far side upside down—the lid now forms the base on which have been cast the lugs necessary to keep the track through the furnace. A narrow-gage truck carrying a roller table then transports one loaded box to the furnace end, as shown in Fig. 1. When the truck is in the proper position at the charging point, it is locked in place, the door is opened and the pot is shoved into the furnace. A cooling box may also be withdrawn from the other row at the same time.

Six rows of Q-alloy rollers are placed in each furnace, as shown in Fig. 1. Each pot-base is attached to the pot just ahead by an inverted U link, and the string is moved through the furnace by a hydraulic pusher mechanism manufactured by the Oilgear Co. Time is regulated by the setting on a Stromberg clock.

Boxes which have passed through the furnace are trucked to the racks shown in the left foreground of Fig. 3. After further cooling, the pots are lifted and contents

Fig. 2—Control for Battery of Counterflow Carburizing Furnace. Oil gear pushers regulated by motor driven contactors in foreground. Power input regulated by switches above, controlled by recording pyrometers

Fig. 3—Loading and Unloading Equipment for Pot Carburizing. Straight-line counterflow furnaces in the rear

dumped on the screen, which catches the metal parts and passes the compound into pans placed beneath.

Long narrow boxes have a capacity of 20 camshafts. Ring gears are packed in round pots, which ride through the furnace in pairs.

Incoming boxes are heated in the preheating zone to a temperature of 750 to 800 deg. Fahr. in the center of the box. The pyrometer settings are for 1650 to 1660 deg. in the heating zones and 1670 to 1680 deg. in the holding zones. A case 0.060 in. deep is obtained in a total time of 32½ hr. Economy in operation is shown by the low power consumption: the output is 16½ lb. per kw. hr. gross on the above cycle.

Definite heat-treating schedules follow:

The rear axle drive pinion, of chrome-vanadium steel, is first annealed at 1700 deg. in a continuous electric furnace,

remaining in the furnace 3 hr., of which one hour is at full temperature. It is then cooled in boxes and machined. Threads are copper-plated to prevent carbon penetration during carburizing. The rest of the pinion is carburized to an average depth of 0.035 in. It is then heated in cyanide for 10 min. at 1320 deg., transferred to a lead pot for 6 min. at 1450 deg., and then quenched. The final operation is drawing 40 min. in oil at 300 deg. The pinion after these successive operations is tested on its teeth for file hardness.

Camshafts, made of series 1020 S.A.E. steel, are rough-machined after forging. Then they are copper-plated all over, the copper is ground off the cams and bearings, and they are carburized to a depth of 0.060 in. After this they are hardened out of a cyanide pot, quenched in a solution and drawn. They are held to a scleroscope hardness of 80 to 90.

Japanese Scientists Study Crystal Lattice of Martensite

IF the density of quenched steel be measured it will be found to decrease as the carbon goes up, from about 7.860 for quenched Armco iron to 7.757 for quenched 1-per cent carbon steel. The reason for this expansion may be (a) high internal tensile stresses, (b) the presence of sub-microscopic cavities or (c) the expansion of the space lattice.

Sinkiti Sekito has tested the last assumption by means of X-ray analysis, and the results are published in Science Reports of Imperial Tohoku University for June, 1928. He used carefully prepared rods of quenched Swedish steels, varying from 0.1 to 1.0 per cent carbon. Measuring the distance between spectral lines (a function of the space lattice) and interpreting his results he finds that the space lattice of a quenched 1-per cent carbon steel is 0.45 per cent greater than of quenched carbon free iron. Since this agrees with the 0.44 per cent calculated from specific gravity experiments, he concludes that the expansion on quenching is due to a general increase in size of space lattice.

Diffusion of the spectral lines is also more marked in quenched high carbon steels. Breadths of these markings were measured by refined methods and appear to be a func-

tion of the carbon content. Prof. Honda believes this phenomenon indicates distortion of the lattice by balanced internal stresses, some positive, some negative, caused by carbon atoms present in the interspaces between iron atoms. On this assumption, the observed widening of the spectral bands would require an internal stress of 275,000 lb. per sq. in., which is nearly the ultimate tensile strength of quenched high carbon steel.

On the other hand, the Swedish investigator Westgren believes that the broadening of the spectral bands indicates a great refinement in the size of the ultimate crystal grain. Mathematical analysis of the experimental results indicates that an average grain size of 150 Angstrom units would produce the observed effects, a size which is far below the limit of microscopic resolution. The Japanese investigators reject the supposition that the well defined crystals of martensite observed under the microscope are further composed of a large number of elementary crystals, oriented at random, as called for by Westgren's hypothesis, and by Jeffries and Archers' slip interference theory of hardening.

Making Nuts and

BY F. W. MANKER*

SELF-CONTAINED from raw material to finished product, rolling its own steel bars and drawing its own steel wire, the Buffalo Bolt Co., North Tonawanda, N. Y., is one of the country's largest manufacturers of nuts and bolts. These are hot forged or cold headed and then carefully heat treated.

Rolling is done in a mill which includes two stands of 16-in. and six stands of 12-in. in a continuous train and five stands of 10-in. and two stands of 8-in. Belgian trains. These roll down to $\frac{1}{4}$ in. As the hot rods pass from the finishing stand, they are coiled in machines which automatically discharge the coils on to a 125-ft. muffle conveyor for slow cooling. The coils are picked off from the other end and placed on industrial cars for delivery to different departments.

There is also a 240-ft. cooling bed for straight bars and a rotary shear for cutting these bars to length.

A continuous billet heating furnace fired with gas fuel brings the steel to rolling temperature. This furnace is 34 ft. long and 17 ft. wide and is equipped with a 20-ft. charging table and electric pusher. Nine gas burners, located in the discharge end, fire above the hearth. A temperature of 2500 deg. Fahr. is obtained. The waste heat flows back to the charging end, where it passes out through an opening in the roof of furnace, over which is mounted the air preheater. Fresh air, taken in through this heater, is premixed with the gas and this gas-air mixture is fired through the burners.

Steel billets, which range from $2\frac{1}{2} \times 2\frac{1}{2}$ in. to 4 x 4 in., 15 ft. long, lying at right angle to the long axis of the furnace, are pushed through from one end to the other on skids. The side-door discharge principle is employed; another

pusher forces the hot billets out endwise through a small opening at the discharge end, at right angle to their line of travel through the furnace on to a conveyor which takes them directly into the roll train.

Other departments in this plant include the following: wire mill, cold heading and cold nut department, hot forge and hot punch department, pointing and trimming department, bolt threading and nut tapping, tumbling and nut storage, machine shop and tool department, and hot galvanizing and electroplating sections. In addition there is the jobbing department for special work.

Nut Department Laid Out for High Production

In the cold heading and cold nut department are long lines of cold heading machines for upsetting the bolt ends and batteries of punch presses for cold punching nuts. Raw material for the bolts and small sizes of nuts comes in coils, while that for the large work is in bars. This material, delivered on industrial cars, is unloaded and distributed to the individual machines by overhead cranes. Finished work is discharged automatically into buckets and is removed by the same cranes and industrial cars.

In this department there are made, every working day, 2,000,000 nuts and 1,000,000 bolts. Some of these nut machines produce as high as 10,000 nuts an hour.

In layout this nut department is typical of the labor-saving methods utilized elsewhere in the plant. The machines are placed in two long parallel rows with an aisle between. A crane spanning this aisle distributes the raw material from the industrial cars to the machines. One man suffices for this work. The finished product is discharged on the other sides of the machines into buckets, which are handled by monorails operating in the outer aisles.

Long lines of mechanical headers for bolts and punch presses for nuts are in the hot forge department, all served with furnaces in which the material is heated. This department is capable of turning out 1,000,000 bolts and 500,000 nuts daily. Most of the furnaces are of the box slot type,

*Vice-president Surface Combustion Co., New York.

At Top of Page Is Shown a Battery of Continuous Automatic, High-Speed Hot Bolt-Heading Machines with Their Heating Furnaces. Wire is fed from coils through the furnaces and thence, properly heated, into the machines.

Section of Forging Department, with Row of Forging Machines, Each Served by Its Own Heating Furnace (top of right-hand page).

Bolts from Billets

and many of them are fired with gas. They are about 6 ft. wide, 5 ft. high and 3 ft. deep. Another type of furnace with about the same cross section, but 28 ft. long, heats 25-ft. bars over their entire length. These bars are then removed and put through automatic and continuous bolt-heading machines.

Combination Furnace and Hot-Heading Machines

Many of the machines in this plant were designed and made by the company engineers and mechanics. There are seven high-speed hot bolt-heading machines fed by wire in coils, the first end of one coil being welded on to the rear end of the preceding coil, so that the machines run without interruption. The principal feature is the forging furnace which is coupled to each. The wire from the coils passes first through the furnace, where it acquires the correct forging temperature, and then directly into the machine, which heads, shears and ejects the bolts automatically.

This is one of the few instances in industry where the two operations of heating and forging have been synchronized into straight-line mechanical production. This necessitated automatizing the heating operation and the designing of a furnace with sufficient capacity to deliver wire at forging heat at a very high speed. How successfully this was accomplished is reflected in the fact that each unit will turn out 85,000 bolts a day. They are served with overhead cranes in front, to bring in the raw material, and a monorail in the rear to remove the finished work.

For pointing and trimming a department is equipped with several types of machines. Here is a battery of automatic pointing machines for carriage bolts and gimlet pointing machines for coach screws. The first are hopper fed and continuous in operation. Automatic flash trimmers shear the flash from the heads of the forged bolts, while others trim cold upset heads, either square or hexagonal. Some of these were designed and built at the plant. One type is provided with a hopper which feeds the bolts into it; rotary cutters trim two sides, the bolt is given a quarter

Automatic Machines, Associated
With Gas-Fired Furnaces, Give
Large Output—Heat Treating
Important

turn and the same cutters trim the other sides. This unit has a capacity for 90,000 bolts daily.

Another group consists of three machines to a unit which point, thread and screw on the nut in three continuous operations. These are equipped with a device which automatically picks out and rejects any bolts which may pass through without being nuted. There is also a battery of full automatic nutters here, which were designed and made by the company.

One Boy Feeds Ten Tapping Machines

Most of the bolt threading and nut tapping is accomplished in another section, where are located batteries of vertical machines designed and built by the company for this purpose. One line of 42 semi-automatic tappers requires the services of only one boy to feed every ten machines. There is also a bank of machines for cold rolling threads on to small bolts. Close by is a group of full automatic tapping and threading machines, while for facing the top and bottom of bolt heads a line of semi-automatics is provided.

Drill presses are used for drilling cotter pin holes and automatic bolt slotting machines for slotting the heads of screws. The finished products all go through a huge rotary washing machine. From this they are discharged on to a long belt conveyor which runs between two lines of girls who inspect the work for imperfect specimens. Ten rotary tumblers located in an overhead gallery are used for pol-

ishing. These are fed by cranes and discharged by gravity into storage bins. In some of these the material is heated, to impart a better polish to the product.

Finished work is all heat treated so that it shall have the greatest possible strength, toughness and resistance to wear. A recent innovation in the heat-treatment room was the installation of a distinctly new type of heat-treating machine or furnace designed expressly for small work on a large scale. Known as the Victor-Peninsular furnace, this unit was built by the Surface Combustion Co., Toledo, Ohio. It is a combination of furnace and traveling conveyor.*

The furnace, of brick, is equipped with an automatic temperature control. The conveyor has motor drive through variable-speed gearing, so that the entire unit is continuous and automatic in operation. It is about 18 ft. long, 4 ft. wide and 3 ft. high, the heating chamber occupying about 12 ft. The conveyor belt is suspended between two steel pulleys, located at either end of the furnace, and rests directly on the hearth. It is made of stainless steel and is about 12 in. in width.

At the charging end a 6-ft. roller table is provided which acts as an aid in loading, while at the other end the product drops by gravity directly into the quench. The burner equipment consists of a number of tunnel burners firing below the hearth. These are manifolded to low-pressure inspirators which automatically proportion the gas and air for perfect combustion and the furnace atmosphere desired.

Motor-driven valves actuated by automatic heat control units are provided, the first to control the temperature in the preheating and heating zones and the second to regulate that in the soaking zone. The rest of the equipment consists of two thermocouples and two recording controllers. In this manner the correct heat gradient is maintained automatically and without attention of a workman. This furnace is so fired and the gradient so regulated that the work is heated gradually to the maximum temperature, with a

minimum temperature differential between the furnace and the work.

Reducing Atmosphere Avoids Scale Formation

When the inspirators are set so as to provide a reducing atmosphere in the furnace, the work is discharged in a practically scaleless condition. At the unloading end is a quench tank 6 ft. long, 3 ft. wide and 2 ft. deep, into which the work is discharged through a chute or water seal, which prevents contact with the room atmosphere and thus avoids scale. The tank is equipped with a woven wire conveyor, of the rotary elevator type. This carries the work slowly through the quenching fluid and finally removes it from the tank and discharges it into containers. This conveyor is driven by the same motor that drives the furnace conveyor.

Another type of furnace in this plant is used for forging the ends of the oil-well sucker rods. This unit is about 6 ft. long, 3 ft. wide and 4 ft. high and of the slot type. Constructed of brick, it is heated with gas fired through Surface Combustion Co. tunnel burners. There are six of these, grouped in a battery and located in the roof of the furnace, so as to fire down on the work.

Gas is supplied through two manifolds and one inspirator for proportioning the gas-air mixture. This system of firing has resulted in marked fuel saving as compared with the previous method used for this work. An upsetter is placed alongside the furnace and the ends of the rods, which are 25 ft. long, are shaped in it. A unique, hand-operated conveyor consisting of three endless chains is utilized for advancing the rods, and the ends projecting into the furnace, as the work progresses.

There is a completely equipped machine shop for making practically all the machines used here and an engineering and research department where they are designed and improved. A tool room is supplied for making tools, dies, jigs, etc. Laboratories, both chemical and physical, are used to analyze and test all material coming into the plant and finished work going out. All lots of raw material are immediately analyzed on receipt and are tagged with this analy-

*Furnaces of this type were illustrated and described by THE IRON AGE, in the issue of Oct. 27, 1927, page 1158.

Battery of Automatic Tappers, of Which One Man Handles Ten. Trays of nuts move on conveyors, as shown

Long Line of Automatic Threaders, With Boxes of Bolts Ready to Be Threaded

sis. The same tag is put on the material after it is rolled and follows it through the plant. In this manner any de-

fective products can be traced back to the original shipment of raw material.

Using Business Statistics to Improve Business

IN the recently issued publication, "How to Use Current Business Statistics," prepared by Mortimer B. Lane, editor *Survey of Current Business*, published by the Department of Commerce, it is shown how business men can make the best use of current statistics. As pointed out in the foreword by William M. Steuart, director Bureau of Census, the use of current statistics is so widespread and varied that a description of the methods must draw its materials from many sources, and this has been done by Mr. Lane. He deals with a number of specific industries, among them those making metals and machinery. He precedes discussion of use of statistics by the various industries with a rather detailed description of the problems involved and their solution, the different phases of statistics and the results obtained from their use.

In his comment on metals and machinery, Mr. Lane points out that a great range of statistical data is used by steel manufacturers in planning their business policies. One company, it is stated, watches particularly the statistics of agriculture, building construction, automobiles, railroads and exports, to see how the consumption of steel may be affected; while prices, wages and living costs are watched as bearing on wage questions. A manufacturer of sheet steel products compares his new orders with those of allied industries, to find out and improve his weak points. A fabricator of structural steel watches the figures on building construction and the trends of the various industries, to ascertain their prospects for expansion, which would mean larger sales of structural steel.

A manufacturer of steel barrels, Mr. Lane says, uses the monthly steel barrel statistics as publicity material in his monthly price bulletin to companies using steel containers for shipment or storage. This manufacturer also determines regularly the proportion of the total business that he is getting, as well as the proportion in each territory, so that weak spots in the sales organization can be picked out. Another firm in this line has compared its productive capacity with that for the industry as a whole by months

for three or four years, and it has found that its business is becoming more stabilized each year.

Statistics of the iron and steel industry, it is stated, are used extensively by another firm in planning its sales programs and in checking up on the results. A company manufacturing tools and hardware finds that the curve of its sales is preceded by construction figures three months ahead, by speculation nine to 12 months ahead and by money rates, inverted, 12 to 15 months ahead. Study of the proportion of the individual business to the machine tool industry as a whole led two managers in this field to determine the cause for the reduction in their proportionate share of the total business, although gaining in actual value. This study led in one case to a reconstruction of the selling department, this being the weak point in the organization.

Other manufacturers in this same line found from figures of stocks, shipments, etc., that they had locked up a larger amount of capital for each unit sold than had their competitors as a group. This led to revamping their production system, installing better methods of process and inventory control, and the liquidation of stocks, resulting in the accumulation of interest-bearing investments. The sales manager of a machine tool company uses the trade statistics to concentrate his efforts in the prosperous centers, and a distribution of the business statistics throughout the sales department has been found to produce new confidence in business.

Adoption of a commercial standard for 250-lb. iron or steel screwed unions will be the subject of a conference under the auspices of the Commercial Standards Unit, Department of Commerce, on Monday, Sept. 24, at the Commerce Building, Washington. Notification of the conference has been given to producers, distributors and consumers by I. J. Fairchild of the Commercial Standards Unit, and has been accompanied by copies of the proposed standard.

Two Shifts and 88 Hours a Week

Morgan Plan at Worcester, Mass., Gives Each Worker Nearly Half a Day of Daylight Out of the Shop

FOR six years the Morgan Construction Co., Worcester, Mass., builder of rolling mill and wire mill equipment, has been operating its machine shops on a schedule of 88 hours per week, or 4500 hours a year. This unique arrangement is continued with satisfaction to the management and evidently to the 600 employees affected. Company officials state that the double shift has produced economies, particularly in a wider distribution of overhead.

One of the two shifts goes to work at 6:30 a.m. and ends its day at 2:30 p.m.; then it is replaced by the second shift which is on until 11:42 p.m. With 24 minutes out for each shift for a meal, and with the first shift working up to 12:30 noon on Saturday, each shift has a 44-hour week. The first has for five days a daily work schedule of seven hours, 36 minutes, followed by six hours on Saturday. The second shift works five days of eight hours, 48 minutes each. The shorter week does not materially af-

fect the employees' weekly wage, which compares favorably with the average paid in similar lines of manufacturing, locally and the country over, where the hours of the men are somewhat longer.

The Morgan management thus sums up the advantages which time has demonstrated for the plan: Overhead costs are kept much below what they would be were the machinery operated only 48 to 54 hours per week. Investment in equipment is kept down, and machines yield a maximum return during the years when they are still modern; that is to say, before machines of more efficient design are available to supersede them.

The employees have given every evidence that they like the plan. No work is required of them Saturday afternoon or Sunday. As it has worked out, the younger men generally prefer the second shift, with its longer hours but only five days a week, for it gives them a very long week end, from 11:42 Friday night

to 2:30 Monday afternoon. On the other hand, the older men as a rule prefer the first shift with its shorter day, but something to do every week day. Every man has approximately half a day of daylight outside of the shop. Every one has ample time to work a garden or otherwise occupy himself about his home or in recreation elsewhere. Sleeping in the hotter hours of a summer day is never necessary. All the men may travel to and from their work during off-peak hours of local traffic.

Another advantage to the company is a full overlapping hour of supervision. The foremen of the first shift stay on half an hour after their men have departed and the foremen of the second shift go on duty half an hour ahead of their men.

The company regards its two-shift system as a happy medium between the one-shift and the three-shift plans. Naturally where manufacturing processes are continuous the three-shift day is necessary. But studies made by the Morgan Construction Co. have demonstrated that in a machine shop the night shift, from midnight on, is the least productive, and that, all things considered, better results are obtained by eliminating it.

Steel Piling Sections Redesigned

Jones & Laughlin's New Shapes Combine Strength, Stiffness and Hardness by Economical Disposition of Metal

THE Jones & Laughlin Steel Corporation, Pittsburgh, is placing on the market the first two of a series of improved sections, known as the "improved double lock steel sheet piling." The new types, invented by Charles S. Boardman of the Jones & Laughlin organization, take the place of piling sections formerly manufactured by the company.

A saving in weight of as much as 20 per cent is one of the claims made for the new Jones & Laughlin sections. The sections are integrally rolled from blooms of steel selected to give them a tensile strength of 70,000 to 80,000 lb. per sq. in. and a hardness sufficient to prevent upsetting while being driven. The figure shows section C-27. Section EC-23.75 has exactly the same cross-sectional shape except that the wings are bent to 35

deg. from the perpendicular. Type SW-22 is a straight web or tension section.

The C sections form a deep channel and are primarily intended for dock or bulkhead work, and to be driven for permanent constructions. The EC sections are rolled as extended channel general utility sections for cofferdam, dock and shallow cofferdam work. Sections C and EC may be used in combination as intermediate

sections in order to economize on weight.

All sections have the same compact interlock, of three-line contact, of high tensional strength and watertight qualities, with ample clearance for free driving. Deflection in each interlock can be 20 to 30 deg. each side of center line. Interlocks are so designed that they tighten under stress or pressure. A special engineering department will furnish reports, suggestions and plans to assist in the correct and economical use of Jones & Laughlin steel sheet piling in the many forms of construction for which it is adapted.

A 600-hp. oil-electric locomotive will be used in switching service in Chicago by the Illinois Central Railroad. The locomotive is one of those developed by the Ingersoll-Rand and General Electric companies.

New J. & L. Sheet Piling. Weight 32.5 lb. per linear ft. of bar

Precision Units for Welding Operations

Fig. 1

Fig. 2

AUTOMATIC welding or cutting machines are by no means the rough devices which one might expect from the association with such high temperatures. Not only is the greatest ingenuity exhibited in the jigs and fixtures, but self-indexing and automatic control devices worthy of the best quality machine tools are installed on equipment for production work.

Thus, Fig. 1 is a close-up view of the main drive of an automatic shape cutter made by General Welding & Equipment Co., Boston. This drives a parallel motion device, directing the motion of an oxy-acetylene cutting blowpipe. A floating tube mounted on a ball-bearing turntable presses

two sharp cones a-straddle the bent aluminum template strip. The cones are motor driven through a differential, allowing one to slip around square corners.

Automatic drive and current control for a single spot welder (Model No. 275, Thomson Electric Welding Co., Lynn, Mass.) is constructed on entirely different lines. Fig. 2 shows a motor and train of gears which drives a main cam, which through connecting levers opens and closes the welding electrodes at adjustable pressure up to 600 lb. The contactors shown in the view control the welding current through remote-control switches on incoming power lines. One depression of the foot treadle results in one complete cycle and the production of one spot weld.

Even more intricate is the machinery installed by Ford to make steel automobile wheels. Fig. 3 shows the steel rim and ten short spokes placed in a fixture. Welds are made between the rim and the spokes, one at a time, the machine indexing and welding automatically, and stopping when the tenth weld is made.

Flash welding of steel sheets is utilized to join stampings, or even sheets before stamping. The Thomson welder, shown in Fig. 4, will take sheets up to 54 in. wide, and the clamps and dies are designed to weld a 13-in. strip of flat steel (which will later be formed into a windshield post) to the bent side of an automobile cowl. These clamps are shown in closed position from the rear side of the machine. A double cam is necessary on the push-up mechanism because of the extreme width of the platen.

Fig. 3

Fig. 4

Adds to Line of Standard Milling Machines

TWO new machines, designated as the No. 1A universal and No. 1B plain, have been added to the line of standard milling machines of the Brown & Sharpe Mfg. Co., Providence. They are similar in design to the company's Nos. 2A and 3A standard universal and the Nos. 2B and 3B plain milling machine described in THE

construction, and are provided with automatic longitudinal and transverse table feed. Vertical feed for the table is by hand. Similar to the "standard machines" previously brought out by the company, the Nos. 1A and 1B are of the sliding gear type. They are provided with a single lever, located at the front of the

spindle is mounted on three roller bearings.

Automatic lubrication throughout is another feature, a pump in the column delivering filtered oil to all mechanism within the column and to the driving pulley. Automatic lubrication is also provided for the knee assembly. The knee may be clamped either

The Machines Are of Motor-in-the-Base Type, with Double Overarm and Automatic Longitudinal and Transverse Table Feed. The No. 1A universal, with motor drive, is at the left and the No. 1B plain milling machine, with belt drive, at the right

IRON AGE of Jan. 19, but are of slightly smaller capacity. They are not equipped with the power fast travel feature, dual control for feed changes nor furnished with a pump, although the power fast travel and pump can be provided as an extra, if desired.

The machines are of the motor-in-the-base type, with double overarm

machine, for operating the feed changes. Speed changes in two series are also obtained by means of a single lever, which is on the side of the column. Direct reading dials indicate in both cases the feed or speed for which the machine is set. Feed and speed units are equipped throughout with heat-treated alloy steel gears. The

from the front or rear of the table by a single lever. It is provided with a one-piece knee screw which is completely guarded in all positions and does not extend below the floor. The driving clutch, located outside of the column, is of the dry multiple-disk type, operated by a single lever on the side of the machine.

Brake Drum Turning and Honing Lathe

A MACHINE for turning and honing the brake drums of both passenger cars and trucks has been placed on the market by the Reed-Prentice Corporation, Worcester. The unit for passenger car brake drums is illustrated herewith; for truck brake drums an outboard support attachment with steel floor plate is furnished. Operation of the machine equipped for truck wheels is the same as that for the turning of passenger car drums, and in both cases the brake drums can be turned without removing the tire or rim.

Modern engine lathe standards are followed in the construction of the machine, which is provided with a pedestal base and is equipped with a tapered roller bearing spindle. The spindle drive is through worm and worm wheel, which run in oil, power being supplied by ½-hp. or 50 or 60 cycle, single phase, 110 or 220 volt alternating current, or 115 or 220 volt direct current motor. The tool-slide is actuated by a 1/12-hp. electric mo-

For Turning and Honing the Brake Drums of Trucks an Outboard Support Attachment Is Employed

tor through worm and worm wheel. Both motors are connected with a tumbler switch which automatically controls the feed of the tool-slide through an adjustable rod, the tumbler switch controlling both the drive and the feed motors. Passenger car and truck wheels are applied to the machine by a taper arbor which fits a corresponding taper hole in the spindle. The arbor, in turn, is threaded for a draw-bar. Arbors, bushings and other parts necessary for mounting the various passenger car and truck wheels are regularly supplied.

A honing tool, consisting of a bar which fits the tool block in the same manner as the cutting tool and is arranged to hold two honing stones, is available as an extra for use with the machines. The honing attachment is arranged so that it will function both on the outside and the inside of the brake drum. It is intended for use in getting a better finish, although it is stated that in the majority of cases the turned drum is satisfactory.

General-Purpose Marking Machine of Improved Design

INCREASED ease of operation and greater capacity are major features of a new general-purpose hand-operated marking machine, which is being introduced by the Noble & Westbrook Mfg. Co., East Hartford, Conn.

The new machine, designated as the No. 4, supersedes the No. 3 model previously manufactured by the company. It is designed to mark, by means of steel dies, trademarks, names, letters and numbers on flat or round metal parts of various shapes and sizes. The frame is heavier than that of the previous model and projecting parts that might interfere with the operator have been eliminated. The operator stands or sits in front of the machine, instead of at the sides as before, which arrangement enables the operator to put the work in the holding fixture more rapidly and also to observe more conveniently the movement of the marking die.

Parts to be marked are held in a suitable fixture which is fastened to the work table of the machine. Pressure on the foot-treadle raises the table and brings the work in contact with the marking die, this movement being accomplished through a compound lever arrangement. By pulling the handle down the die is moved across the piece to be marked. This handle may be set in the position most convenient for the operator. The

The Machine Is Heavier and Easier to Operate Than the Former Model. Projecting parts have been eliminated

slide is extra heavy and is fitted with roller bearings. It is regularly built

to give a mark $4\frac{1}{2}$ in. long, but can be furnished for making marks up to 6 in. long. Adjustable stops are provided at the front of the machine to control the length of the stroke. Movement of the slide is through heat-treated steel gears. The table is set to the proper height by means of a handwheel on the elevating screw and graduations in increments of 0.001 in. permit close control of the table stroke so that accurate depth of impressions may be obtained. The maximum distance between the slide and the table is $8\frac{1}{2}$ in., and $6\frac{1}{2}$ in. under a round die.

A roll die-holder of new design can be supplied. It is inserted in the machine in a dovetail slot just above the table, and an adjusting screw is provided to facilitate changing the position of the die-holder from front to back, which eliminates the necessity of moving the entire work-holder. The die is returned to position for making the next mark by means of a spring of simple design. The die-holder can be taken out of the machine without lowering the table, which is a new feature. Replacable bronze bushings and a hardened spindle are other features of the die-holder. The starting point of the die is adjustable by means of a thumbscrew.

Floor space occupied by the machine is 20 x 20 in. The weight is 425 lb.

Roller-Bearing Equipped Roll Lathes

TWO direct motor-driven heavy-duty roll lathes with roller bearings on all gear shafts, which is emphasized by the builders, the Mackintosh-Hemphill Co., Pittsburgh, as a departure in roll lathe design, are shown in the accompanying illustrations. The improved design, including the provisions for lubrication of the headstock mechanism, is intended to provide a fool-proof drive which operates with the minimum amount of friction and requires the minimum of attention from the operator.

The 31-in. machine, the shorter of the two lathes illustrated, is designed to operate at speeds ranging from 0.73 to 6.50 r.p.m. It is motor-driven and the headstock is entirely inclosed, which permits the gears to

dip in a bath of oil. In addition, spray lubrication is provided.

Two rolls 36 in. in diameter and 8 ft. 6 in. in length can be turned simul-

taneously on the second lathe here shown, the headstock of which is also equipped with roller bearings. It has spray lubrication for the gear teeth

The Headstock Mechanism Is Automatically Lubricated. The 31-in. roll lathe is shown above and the 36-in. lathe, which simultaneously turns two rolls 8½ ft. long, is at the left

and pressure grease lubrication for the bearings. The motor is mounted directly on the headstock and is arranged to drive the machine through a flexible coupling.

Offers New Portable Pneumatic Riveter

THE Hanna Engineering Works, 1765 Elston Avenue, Chicago, has made available the portable pneumatic riveter illustrated, which weighs

Pressure of 1 Ton Is Exerted on the Dies When the Riveter Is Operated at 100-Lb. Air Pressure. The weight of the machine is 15 lb.

only 15 lb. and is designed for driving tubular bronze or steel rivets up to 3/16 in. in diameter. The machine exerts 1-ton pressure on the dies when operated at 100 lb. per sq. in. air pressure. The depth of throat, or reach, is 5 in., the gap, 2 in. and the die stroke, 1 in.

Air supply to the tool is controlled by a thumb-actuated valve in the pistol grip. The rivet driving die is connected directly to the pistons, of which there are two, the return stroke being actuated by springs. The handle may be located at the end of the machine as shown, or at the top, to suit conditions. The machine is said to be particularly adapted for the riveting of automobile hoods, bodies, instrument panels and similar work.

Establish New York-Cleveland All-Water Line

A through water transportation line between Cleveland and New York is being established by the Erie & St. Lawrence Corporation, a subsidiary of the Great Lakes Grain Corporation, Buffalo. This company has five 252-ft. steel ships, driven by Diesel engines and having a capacity of 1500 to 1600 tons at 9½-ft. draft. These boats have been in service carrying grain from Buffalo to New York and Montreal.

The establishment of the new line is the result of negotiations with the Cleveland Chamber of Commerce. The operation of this line will be somewhat experimental this year, but, if it proves successful, regular service will be established next season. It is stated that there will be no difficulty in securing cargoes for west-

bound shipment, but experimental service will be necessary to determine whether there will be sufficient east-bound cargoes.

The route of the line is via Lake Erie, the Welland Canal, Lake Ontario, the Oswego Canal, the New York State Barge Canal and the Hudson River. Boats will make the trip between Cleveland and New York in six days. A cargo of sugar will be delivered in Cleveland on one of these boats at the end of this week, and

some steel products, including wire and rivets, have been lined up for the return cargo. A rate of 30c. per 100 lb. is being made on iron and steel, this including marine insurance and terminal charges. This rate is 10c. per 100 lb. under the rail rate. It is expected that if the line is permanently established considerable tonnage in steel products will be shipped over its boats to New York for reshipment to Gulf ports and the Pacific Coast.

Railroads Protest P., L. & W. Extensions

Intervening Roads Maintain That Proposed Connecting Links Would Give Pittsburgh Coal Co. Monopoly on Coal into Youngstown

WASHINGTON, Aug. 28.—Exceptions to the proposed report of C. V. Burnside, assistant director of the Interstate Commerce Commission, recommending that the commission authorize the Pittsburgh, Lisbon & Western Railroad to establish a new rail route between Smiths Ferry, Pa., and the Youngstown district, were filed with the commission last week by the three intervening Trunk Line carriers, the Pittsburgh & Lake Erie, the Pennsylvania and the Baltimore & Ohio. They contended that the new construction would not be in the public interest, as required by the act under which application for permission to construct the new route was made.

In the course of their numerous exceptions, the three roads protested against the failure to find that the proposed construction and operation by the P., L. & W., under the control of the Pittsburgh Coal Co., would enable the latter company to enjoy a monopoly in the marketing of coal in the Youngstown district. It was maintained that the operation of the new line would enable the Pittsburgh Coal Co. to suppress competition between shippers of commercial coal from the Pittsburgh and Connellsville districts to the Youngstown district and, in effect, limit the operation of the P., L. & W. to the private purposes of the coal company. It was pointed out that the report failed to mention the fact that the P., L. & W. would own no terminal facilities at Smiths Ferry for transferring coal from barges to railroad cars, but that those facilities would be owned and operated by the coal company.

Private Shipping Prevented

Replying to the statement in the report that the Government has expended large sums of money in the improvement of the Monongahela and Ohio rivers for the purpose of encouraging navigation on those rivers, the Trunk Line carriers declared that the Government has not expended this money to encourage private shipping and control by a private industry of the wharves and other facilities giv-

ing access to a railroad owned by that industry.

The purpose, it was stated, is to have the rivers utilized by common carriers so that the general public may receive the benefits.

The Pittsburgh Coal Co. and the Youngstown Sheet & Tube Co., it was explained, have acquired about one mile of the water frontage at Smiths Ferry, "and in view of the testimony that available sites at that location are not plentiful, it is evident that any other shipper would very likely have considerable difficulty in finding a location for terminal transfer facilities of its own." It was declared that the Republic Iron & Steel Co. and the Sharon Steel Hoop Co., which intervened on behalf of the applicant, as did the Youngstown Sheet & Tube Co., would find themselves subjected to the dictation of the Pittsburgh Coal Co. as to whatever terms the latter company might see fit to exact for the privilege of using the proposed new line.

Pittsburgh's Advantage Geographical

It is conceded by the applicant, the Trunk carriers said, that the latter have ample facilities for handling traffic that would be moved over the proposed extensions. A principal reason assigned for the construction of the proposed lines is to enable the publication of certain rates on bituminous coal inbound to Youngstown and on finished steel products shipped from the Youngstown district, the Youngstown district industries claiming that they are at a disadvantage compared with the Pittsburgh district companies as to rates on raw materials used in making steel. The advantage, if any, that may be enjoyed by the Pittsburgh and Aliquippa, Pa., industries, it was declared, is due to geographical conditions, and the commission in many cases has decided that rates cannot be equalized on that account. The carriers also contend that the P., L. & W. would have no assurance that it could legally maintain the proposed rate of 60c. a ton on coal between Smiths Ferry and Youngstown.

Business Analysis and Forecast

Better Business Conditions Predominate

Upturn of P-V Line Indicated, Presaging Improvement in
General Trade—Many Conflicting Factors

BY DR. LEWIS H. HANEY

DIRECTOR, NEW YORK UNIVERSITY BUREAU OF BUSINESS RESEARCH

WHILE the total industrial situation is about normal and, on the average, the demand and supply in the commodity markets are in fair balance, the situation is not definitely bullish. Commodity prices in general have moved somewhat irregularly during the past few months, with no pronounced trend. Weakness in agricultural commodities and in some of the basic raw materials indicates that the supply is in excess of requirements and larger than the demand could take care of at existing prices. We think steel production has been recently somewhat in excess of requirements, an opinion that is confirmed by the sharp decline in unfilled orders during the latter part of July. The total situation is illustrated by the nearly sidewise movement of the P-V line, which shows no great maladjustment be-

tween supply and demand, on the average.

As to the money situation, there is no change to report in fundamentals except that the outward movement of gold has apparently ended, leaving conditions to become adjusted to our reduced gold supply. Commercial loans continue to increase and brokers' loans, in spite of recent small declines, remain too large. The seasonal demand for funds in connection with crop moving and currency requirements has already begun. The member bank borrowings from the Reserve banks remain at over one billion dollars. The banks continue to liquidate securities. Their net demand deposits are declining.

We see no prospects of any considerable gold imports, as, on the one hand, foreign governments are certain to support exchange rates and are pre-

pared to raise their rediscount rates if necessary, while, on the other hand, the Federal Reserve Board's policy is obviously unchanged. We must remember that the yield on invested capital in the United States is now too low to be attractive, and that high short-term money rates can be permanently relieved only by the process of liquidation in those quarters which are responsible for the current stringency.

Influence of Money Rates

TIGHTENING of bank credit is the most immediately active unfavorable factor in the business situation. Ultimately building activity will slow down as a result of this factor. The let-up in July may have been due to high rates for money and may possibly mark the beginning of a decline in building operations. Such an occur-

Factors in the General Business Outlook

Favorable Factors

- (1) *Automobile production and sales large for the season.*
- (2) *Retail trade in good volume and above a year ago.*
- (3) *Merchandise exports and imports increased in July; gold exports reduced.*
- (4) *Payrolls and earnings increased in July; employment held steady.*
- (5) *Moderately favorable agricultural situation.*
- (6) *Earnings statements indicate that average company has been making fair progress.*
- (7) *Strong financial position of leading companies.*
- (8) *Light mercantile inventories.*

- (9) *Absence of any important industrial maladjustment.*

- (10) *General commodity prices firmer recently; non-agricultural prices in July were the highest in a year and a half.*

Unfavorable Factors

- (1) *Building activity fell off in July; sharp slump in contemplated new construction.*
- (2) *Money tighter and bank credit more strained; net demand deposits declined, while loans continued near record levels.*
- (3) *Decline in unfilled steel orders.*
- (4) *Railroad earnings and traffic relatively low.*
- (5) *Large average stocks of manufactured goods held by producers.*
- (6) *Political uncertainties.*

Freight Traffic Has Dropped to Almost Its Lowest Point Since 1924 and Is Far Below Its Normal Relation to Bank Debits. These have declined after making the highest record ever known, but it is largely speculative

Sidewise Movement of the P-V Line (Ratio of Commodity Prices to Physical Volume of Trade) Seems to Indicate an Early Rise. Steel production (adjusted) has moved upward sharply

Unfilled Orders Have Again Turned Downward, and Are Lower Than in March; Stock Prices, Though at a Higher Level, Are Irregular and Scrap Prices Are Still Weak but Better

Both Building Activity and Automobile Output Showed Continued Strength in July. They are higher than they were at any time during 1927 or the last quarter of 1926

rence would have a considerable effect in retarding all business.

The farm situation appears favorable, but it is too early to appraise it fully, for if wheat and cotton were to fall much lower in price the total receipts from these great cash crops could easily show a decline, in spite of the large yields. Wheat farmers particularly are threatened by the competition of a bumper Canadian crop in the world market. Any favorable developments in the farm situation are likely to be counter-balanced by the bank situation, which promises to continue strained for several months.

Retail trade continues to be a rather uncertain factor, the reported gains being chiefly due to changes in the number of stores included in the reports. Department store sales showed an approximately steady trend last month, considering the season. Factory employment held steady at about the low level of July, 1924. Payrolls and earnings increased sharply, indicating a high percentage of full-time operation.

Weighing all the favorable and unfavorable factors, we incline to the opinion that the money conditions and their effect on building operations hold the keys to the situation, and that at present the outlook is therefore uncertain, with the evidence at hand showing a balance on the unfavorable side. The absence of severe industrial maladjustment, however, aided by the strong financial position of leading companies and light mercantile inventories, and the proved ability of the majority of the leading companies to make fair earnings in the first half of the year, all indicate that business is not likely to decline much.

Ingot Production Remains Very High

AFTER allowing for the usual seasonal change, steel ingot production in July reached a new high for 1928; in fact, even after allowing for estimated normal growth, the index stood at the highest point since July, 1923. This action is in accordance with the tendency for the P-V line to move upward after a sidewise trend for several months. As yet this is only a tendency, but the condition of firming commodity prices and moderate volume of trade, if continued, may lift this barometer in August. Any such rise would have a favorable significance for steel production and business in general. It should be remembered, however, that the decline in unfilled orders in July indicates that the rate of steel shipments was higher than that of sales, and casts doubt on the probability of much further increase in production.

Rampant Speculation Continues Unabated

OUR second chart portrays a situation that has lately become all too familiar. Business activity as measured by an index of the volume of railroad traffic is not quite up to a year ago. Meanwhile, the index of bank

debits, which is influenced by speculation, remains far out of line with the volume of trade, even after a certain amount of liquidation has taken place in the stock market. The latest car loadings statements indicate a volume of trade about equal to that of a year ago, while the renewed public interest in speculation and the consequent increase in the volume of trading will tend to increase the amount of debits and intensify what appears to be a maladjustment.

Building Activity and Automobile Output High

THE third chart is of interest, as it shows the situation in two of the leading key industries (building and automobiles), which ordinarily consume over one-third of all the steel produced. Both of these industries held at a high level in July, and they were largely responsible for the high rate of steel production at a season when conditions are normally dull.

Automobile production in July, according to our estimates for the United States and Canada, was 127.3 per cent of the average of the past seven years. Allowance was made for the usual seasonal changes. This compares with an index of 122.2 in June and 87.5 a year ago. Thus, activity in July reached the highest point since September, 1926. However, current reports indicate a falling off in production which may be more than seasonal. Sales are said to be holding up well, so that no severe decline is looked for. Moreover, Ford plans to step up production through the rest of the year, and this may help to offset the usual seasonal decline from July through December.

Building activity slumped in July. Contracts have declined only slightly more than is usual for the season, but there has been a rounding off tendency for several months, which leaves the

Pig Iron Imports Drop Sharply

IMPORTS of pig iron in July are reported by the Department of Commerce at 6055 gross tons, compared with 11,799 tons in June and 9732 tons in May. As recently as April a total of 20,845 tons was reported. The July figure is 42 per cent lower than that of a year ago, when 10,377 tons came in. For the first seven months there has been an in-

crease of about 15 per cent, the total reaching 81,350 tons. Nearly half of the incoming movement was from the United Kingdom, which supplied almost 35,000 tons in the seven months, against less than 15,000 tons a year ago. British India, which stood first last year, showed a slight decline and is now second. The Netherlands also showed a slight decline and is in third position. Germany has almost disappeared as a supplier of pig iron to the United States.

Steel Shipments Have Outrun Orders

RENEWED drop in unfilled steel orders in July confirms our statement that the sharp June increase was unconvincing. Production and shipments have increased too fast for sales to keep ahead. It is true that, taking the past two months together, unfilled orders have increased, but they are now well below the level of March. Prices of heavy melting steel scrap declined in July, but showed signs of turning. The August average will be up sharply, which action follows the big increase in unfilled orders in June. The effect of the July decline had not yet been felt in the scrap market.

The price of steel stocks has increased rather sharply of late. The stock price index fluctuates in more or less sympathy with that of scrap prices. The recent increase in stocks followed closely upon the marking up of \$1.50 a ton in scrap prices during the past month. The high rate of production, however, has increased the supply of scrap and, in view of the decrease in unfilled orders, a check may be expected in the scrap market. Steel stocks will probably respond to any such change.

UNITED STATES IMPORTS OF PIG IRON BY COUNTRIES OF SHIPMENT (In Gross Tons)

Fabricated Structural Steel

Chicago Apparel Mart Will Take 74,000 Tons—Awards of 37,500 Tons Include 12,000 Tons for Toronto Building

INCLUDING 74,000 tons for the Chicago Apparel Mart, new structural projects reported during the week totaled 104,000 tons. Other large jobs announced were a hotel addition at Toronto, calling for 7000 tons, a warehouse at Akron, Ohio, taking 4000 tons, and an automobile plant building at Weston, Ont., which will require 3500 tons. Awards of 37,500 tons were swelled by 12,000 tons for a furniture building at Toronto and 4000 tons for a rubber plant building at the same city. Awards follow:

BOSTON, 120 tons, George White Fund health unit No. 4, to A. L. Smith Iron Works.

NEW YORK, NEW HAVEN & HARTFORD RAILROAD, 150 tons, bridge, to Shoe-maker Bridge Co.

STATE OF NEW JERSEY, 200 tons, State hospital work, to Dover Boiler Works.

STATE OF NEW JERSEY, 200 tons, highway bridges, to American Bridge Co.

PENNSYLVANIA RAILROAD, 150 tons, bridges, to Bethlehem Steel Co.

READING RAILROAD, 500 tons, Fifth Street Bridge at Reading, Pa., to Bethlehem Steel Co.

PENNSYLVANIA RAILROAD, 100 tons, electrification work, to Lehigh Structural Steel Co.

BALTIMORE, 300 tons, highway bridge, to Deitrich Brothers.

WASHINGTON, 1500 tons, Lincoln Memorial Bridge, to Phoenix Bridge Co.

ALBERTVILLE, ALA., 150 tons, Saratoga Victory Cotton Mills, to Virginia Bridge & Iron Co.

RANKIN, PA., 220 tons, Monongahela River bridge traffic circle, to John Eichleay, Jr., Co.

CHARLESTON, W. VA., 3000 tons, two Kanawha River bridges, to Independent Bridge Co., Pittsburgh.

TORONTO, 12,000 tons, furniture building for T. Eaton Co., to Dominion Bridge Co.

NEW TORONTO, ONT., 4000 tons, plant building for Goodyear Tire & Rubber Co., to McGregor & McIntyre Structural Steel Co., Ltd.

CLEVELAND, 1400 tons, subway work for Cleveland Union Terminals Co., to Carnegie Steel Co.

CLEVELAND, 545 tons, West 117th Street grade crossing for New York Central Railroad, to unnamed fabricator.

TOLDO, OHIO, 500 tons, addition to Willys-Overland plant, to American Bridge Co.

SPRINGFIELD, OHIO, 600 tons, building for Springfield Metallic Casket Co., to Bellefontaine Bridge Co.

CINCINNATI, 100 tons, Eastern Hills Y. M. C. A. building, to General Iron Works.

DETROIT, 800 tons, furnace bindings for Ford Motor Co. steel works, to Jones & Laughlin Steel Corporation.

DETROIT, 135 tons, car storage building for Chrysler Corporation, to McClintic-Marshall Co.

FLINT, MICH., 150 tons, theater, to Guibert Steel Co.

STATE OF INDIANA, 500 tons, miscellaneous work, to Indiana Bridge Co., Muncie, Ind.

STATE OF ILLINOIS, 3000 tons, lock gates at Brandon Road and Dresden Island for Illinois Waterways Commission, to Independent Bridge Co.

STATE OF ILLINOIS, 575 tons, miscellaneous work in Indiana and Illinois, to Rochester Bridge Co., Rochester, Ind.

CHICAGO, MILWAUKEE, ST. PAUL & PACIFIC RAILROAD, 900 tons, bridge, to unnamed bidder.

WABASH RAILWAY, 260 tons, bridge, to American Bridge Co.

MILWAUKEE, 500 tons, Bankers' Building, to American Bridge Co. and Milwaukee Bridge Co.

EAST MOLINE, ILL., 800 tons, building for Deere & Co., to Rochester Bridge Co.

ST. LOUIS, 150 tons, freight house for Wabash Railway, to Stupp Brothers Bridge & Iron Co.

OLYMPIA, WASH., 450 tons, Marblemont bridge over Skagit River, to Pacific Car & Foundry Co.

WARDEN, WASH., 400 tons, highway bridge, to Pacific Car & Foundry Co.

SEATTLE, 200 tons, Second Avenue extension, to Hofius Steel & Equipment Co.

OAKLAND, CAL., 1160 tons, office building at Fourteenth and Franklin Streets, to Judson-Pacific Co.

OAKLAND, 250 tons, hangar No. 4 for Port Commission, to Moore Dry Dock Co.

SAN FRANCISCO, 1400 tons, pier 45 for State, to Pacific Coast Steel Co.

SAN FRANCISCO, 100 tons, apartment at Ninth Avenue and Judah Street, to Judson-Pacific Co.

Structural Projects Pending

BOSTON, 250 tons, Back Bay station.

BOSTON, 170 tons, stores on Newbury Street.

BOSTON & MAINE RAILROAD, 100 tons, bridge.

STATE OF VERMONT, 200 tons, highway bridges.

STATE OF NEW YORK, 700 tons, highway bridges.

NEW YORK CENTRAL RAILROAD, 300 tons, bridge at Hastings, N. Y.

BALTIMORE & OHIO RAILROAD, 500 tons, bridges at Chicago.

STATE OF PENNSYLVANIA, 400 tons, highway bridges.

CAMDEN, N. J., 500 tons, safe deposit vaults for Camden Safe Deposit & Trust Co.; Ketcham & McQuade, Philadelphia, general contractors.

WASHINGTON, 150 tons, highway bridge.

BUFFALO, 1000 tons, plant building for Bliss & Laughlin, Inc.

TORONTO, 7000 tons, extension to Royal York Hotel.

WESTON, ONT., 3500 tons, addition to plant of Willys-Overland, Ltd.

AKRON, OHIO, 4000 tons, warehouse for B. F. Goodrich Rubber Co.

MIDDLETOWN, OHIO, 900 tons, warehouse for American Rolling Mill Co.

CINCINNATI, 180 tons, building for St. Louis Parish.

CHICAGO, 74,000 tons, architect's preliminary estimate for Apparel Mart.

CHICAGO, 1900 tons, mill building for Interstate Iron & Steel Co.

CHICAGO, 800 tons, addition to Chicago Club.

ST. LOUIS, 200 tons, Delmar Avenue station for Wabash Railway Co.

ST. LOUIS, 100 tons, St. Michael's and All Angels' Church.

NEW ORLEANS, 1800 tons, American Bank Building.

SAN ANTONIO, TEX., 1300 tons, Nix office building.

SAN ANTONIO, 1300 tons, Alamo National Bank Building.

SAN ANTONIO, 200 tons, Groor National Bank Building.

SEATTLE, WASH., 500 tons, addition to Olympia Hotel.

STATE OF WASHINGTON, 375 tons, two State highway bridges.

OLYMPIA, WASH., 450 tons, Nugents bridge in Whatcom County; Ward Construction Co., Tacoma, Wash., low bidder on general contract.

TACOMA, WASH., 330 tons plates, 32-in. pipe line for city; Birchfield Boiler Co., low bidder.

TACOMA, WASH., 700 tons, addition to Hooker Chemical Co. plant.

RICHVALE, CAL., 170 tons, plant for Pacific Coast Paper & Pulp Co.

Reinforcing Steel

Chicago Apparel Mart Calls for 12,000 Tons

WITH the Chicago Apparel Mart calling for approximately 12,000 tons of reinforcing bars, new projects reported during the week amount to 15,600 tons. The following awards, totaling 5200 tons, include no projects of outstanding size:

NEW YORK, 700 tons, foundations for Western Union Building; from Turner Construction Co., general contractor, to Jones & Laughlin Steel Corporation.

KEARNY, N. J., 700 tons, plant buildings 51 and 52 for Western Electric Co., Inc., to Joseph T. Ryerson & Son, Inc.

CHICAGO, 140 tons, miscellaneous work for city, to Joseph T. Ryerson & Son, Inc.

COOK COUNTY, ILL., 850 tons of rail steel, road work, to Barton Spiderweb System, Inc.

STATE OF ILLINOIS, 100 tons of rail steel, road work, to Calumet Steel Co.

RIVER FOREST, ILL., 100 tons, reservoir, to Concrete Engineering Co.

EAST CHICAGO, IND., 600 tons of rail steel, plant building for United States Gypsum Co., to Calumet Steel Co.

ST. LOUIS, 600 tons, Terminal Railway Association express terminal for American Railway Express Co., to Laclede Steel Co.

ST. LOUIS, 400 tons, sections 2 and 3 of Southwestern Joint Sewer District, to Missouri Rolling Mills Corporation.

SEATTLE, WASH., 650 tons, Hanford Street sewer, to Pacific Coast Steel Co.

SEATTLE, 175 tons, Cushman spillway, to Northwest Steel Rolling Mills.

SEATTLE, 150 tons, West Waterway bridge, to Northwest Steel Rolling Mills.

SEATTLE, 100 tons, addition to Seattle Ice Cream Co. plant, to Pacific Coast Steel Co.

SAN FRANCISCO, 150 tons, pier No. 45 for State, to Pacific Coast Steel Co.

SACRAMENTO, CAL., 145 tons, State hospital at Eldridge, to Pacific Coast Steel Co.

Reinforcing Bars Pending

RIVERTON, N. J., 200 tons, road work. Cizzienti Brothers, general contractors.

BUFFALO, 300 tons, Genesee garage, Metzger Construction Co., general contractor.

BUFFALO, 200 tons, superstructure for Rand Building; bids in.

CLEVELAND, 950 tons, Lakeside Hospital buildings.

CHICAGO, 12,000 tons, architect's preliminary estimate for Apparel Mart.

WAUKEGAN, ILL., 225 tons, department store building.

SEATTLE, 500 tons, addition to City-County buildings; bids in September.

SEATTLE, 500 tons, addition to Olympic Hotel.

SAN FRANCISCO, 525 tons, Bernal Cut project; bids Sept. 17.

SAN FRANCISCO, 200 tons, warehouse for Simmons Bed Co.

This Issue in Brief

Heating and forging operations are synchronized into straight-line mechanical production in bolt plant. Forging furnace, coupled to each hot bolt-heading machine, is fed by wire passing from coils through furnace and directly into machine. This necessitated automating heating operation and providing capacity for delivering wire at high speed.—Page 517.

* * *

Will observe centenary of invention of hot blast. First step in fuel economy and consequent high output of blast furnaces increased furnace output from 37,500 tons in 1830 to 200,000 tons in 1840.—Page 512.

* * *

Three electrically operated rotary furnaces in automotive plant do work formerly requiring 26 oil-fired furnaces. Heating costs are higher, but direct labor charges have been reduced one-half and quality of product is greatly improved.—Page 514.

* * *

Says tightening of bank credit is most immediately active unfavorable factor in present business situation. Dr. Haney holds that this will ultimately slow down building activity and that let-up in July, resulting possibly from high money rates, may mark beginning of decline in building operations.—Page 525.

* * *

Metallurgical division of Bureau of Standards receives 3000 letters and 600 personal visits requesting information each year. Majority of these inquiries deal with wear of metals.—Page 510.

Carburizing boxes at Dodge plant are of three-piece construction, $11\frac{1}{2} \times 16 \times 8\frac{3}{4}$ in. in dimensions, and are made of Q-alloy or a nichrome heat resisting alloy. Cast corners and rolled alloy sides which are cast into corners help to prevent breakage.—Page 513.

* * *

Cold heading and cold nut department produces 2,000,000 nuts and 1,000,000 bolts daily. Nut machines are placed in parallel rows with aisles between, which are spanned by cranes distributing raw materials from industrial cars to machines. Finished product is discharged into buckets handled by monorails operating in outer aisles.—Page 516.

* * *

Exports and imports of iron and steel both declined in July. Export total was 3.3 per cent under June, but considerably larger than total for corresponding month last year. July imports declined 27.3 per cent.—Page 555.

* * *

Distinction between "practical" and "theoretical" research is artificial, says metallurgist. Important advances have often resulted from work undertaken for purely practical purposes, and vice versa. Search for fundamental facts is not affected by reasons prompting investigation.—Page 512.

* * *

Precision is achieved in automatic cutting and welding machinery. Self-indexing and automatic control devices worthy of best quality machine tools are now installed on equipment for production work.—Page 521.

Raw materials used in bolt plant are analyzed upon receipt and are tagged with this analysis. Same tag is put on material after it is rolled and follows it through plant. In this manner all defective products can be traced back to original shipment of raw material.—Page 518.

* * *

Plant is operated 88 hours a week on two shifts. Plan gives all workers nearly half day of daylight out of shop, reduces overhead costs and keeps down investment in equipment, as each machine is made to yield a maximum return during years when it is still modern.—Page 520.

* * *

Thinks Belgium, Germany and Italy are European countries offering most promising field for American machinery. Machine tool manufacturer predicts boom for automotive industry in Europe and finds widespread adoption of American mass production methods.—Page 559.

* * *

Economist sees prospect of little decline in business activity. Absence of severe industrial maladjustment, strong financial position of leading companies, light mercantile inventories and proved ability of majority of companies to make fair earnings in first half are sound conditions.—Page 525.

* * *

Fabricated structural steel, sheets and corrosion-resisting alloys have profited by well directed publicity. Steel industry as a whole is failing to avail itself of opportunities seized by particular branches in marketing special products.—Page 530.

ESTABLISHED 1855

Publicity Pays

FROM time to time attention has been called in these columns to the fact that the steel industry taken as a whole is failing to avail itself of one of the most powerful business allies, namely, publicity. It has been pointed out also that publicity means much more than advertising; it includes giving facts to the public generally, and to customers particularly, on many matters which not so many years ago were treated as secret trade information. It involves prompt issuance of statistics on production and stocks, and an adequate and accurate expression of market prices and trends. It is closely allied to an enlightened campaign to improve public relations.

Passing aside for the present any consideration of these more subtle phases, consider for a moment the power of advertising—that most obvious publicity effort. It would be trite to dwell upon the meteoric rise of prosperous companies promoting new devices such as automobiles, automatic refrigerators, vacuum cleaners, electric washing machines, safety razors and radios, and to remind the reader of the commanding part effective advertising has had in their development. “But,” it will be objected, “these people had something new, something to catch the attention of the buyer. What is there of similar dramatic appeal in steel?”

Such a reply could come only from a person of small imagination. Structural steel is apparently a humdrum every-day material to those who roll, fabricate and erect it; but it would be a mine of copy for a skilled advertising man. The very bigness of the things done with it would form a most striking series of advertisements. The Hudson River bridge, the Cleveland terminal project, sky-scrapers and massive commercial buildings in all the big cities, subways and a veritable underground world are all made possible by this common grade of steel, apparently so uninspiring to most of its makers. Indeed such possibilities for attractive publicity have already been seized upon by one of the leading steel producers and by an organization of fabricators. More power to them!

And there's sheet steel. A corrugated iron shed or a culvert is probably as prosaic a thing as could well be built. No chance to go into rhapsodies about that applied artistry, beauty and luxurious appointment which seems to permeate the multi-colored advertising pages of our popular magazines. Yet men with a vision of the needs of industry, and an ability to tell the world about the excellencies of their product, have within a generation expanded a small rolling mill into one of the large independent steel-making organizations.

Another impressive example comes in recent years

in the field of corrosion-resisting alloys. An advertising campaign in one popular magazine and 30 trade publications enabled an alloy iron to break all sales records in 1927, whereas the company's other lines were experiencing the recession which was general that year throughout the industry. The same advertising appropriation has been continued for 1928, and it is reported that the satisfactory sales for 1927 are being exceeded by as much as 30 per cent.

Such facts would be cited by advertising men as another instance of the increasing returns from continued and consistent publicity. To us it seems most important as an exhibit of special marketing of an every-day article of commerce, with the aid of proper publicity.

Bureau of Standards Carries On

MORE than once we have commented on the fact that the metallurgical division of the Bureau of Standards is prevented by lack of funds from attacking many problems which have been proposed and which are within its ability and province. A scant \$125,000 is hardly enough to maintain a going organization of 45 workers, and it is a matter of wonderment and congratulation that so much valuable information is actually produced.

Some of the problems on which work has been requested by industry or by technical societies, but which cannot be taken up until current projects are completed or until more public funds or some assistance from industry are available, are these: Study of methods of testing sheet and strip steel for deep-drawing properties and methods of controlling those properties; study of methods of testing cast iron for machinability; resistance of white bearing metals; study of the fundamentals of the hot galvanizing process; life of piping used in building construction; also several problems on malleable cast iron.

All these subjects are large ones and unless and until funds are in sight to allow work sufficiently exhaustive to bring results it would be wasteful to divide further the attention of the present staff by tackling them as side issues. It certainly would be poor policy to leave a current project unfinished and waste the investment already made in it in order to take up a new one, no matter how important the new one may be. The metallurgical division is thus well advised to adhere to the lines of work already in hand until funds are available for branching out.

No increase in Governmental funds is in sight—in fact a slight decrease appears probable for the next

fiscal year—and it seems likely, therefore, that new problems will be approached only as old ones are finished.

This situation makes it imperative to appraise the suggested new projects so they may be placed in the order of their importance and of the justification for expending public funds on them. On this matter the comments and advice of that cross-section of industry consisting of the readers of *THE IRON AGE* would doubtless be gladly received by the director of the Bureau of Standards.

Organizations in the metal-working field with specific problems to solve and yet without well equipped laboratories should also remember that the "research associate plan" may be the quickest and best way to reach an answer. Briefly the plan is this: If the problem is of sufficient general interest, the Bureau of Standards will receive as guest a competent investigator, whose salary will be paid by the commercial organization proposing the problem, but who will be tendered freely the use of the bureau's equipment.

One of the great advantages of this plan is the contacts which the research associate has with the staff at the Bureau of Standards. Every one knows that these men at the bureau have no financial interest in the problems they study and no tendency toward bias. They are interested solely in what the facts may be, irrespective of whether they lead to one conclusion or another. This impartial and unbiased point of view is a precious possession and the one from which a commercial investigator can receive most inspiration.

The Politicians and the Farmers

BOTH Mr. Hoover and Mr. Smith have now made their speeches and among many other things have expressed their views in regard to the agrarian problem. Neither has been satisfactory to the professional exponents of the corn planters and wheat growers, for to them no sound thinking man can possibly be satisfactory; and both Mr. Hoover and Mr. Smith are sound thinking.

The grievance of the Western farmers may be summarized simply as the complaint against low prices. The plain reason for the latter is that so much wheat and corn are being produced that the growers have to accept low prices in order to dispose of them. Indeed they produce an exportable surplus that has to meet the competition of producers everywhere in the world. The only economic method of elevating the world's price is for producers to reduce their output; but that is something that they refuse to do voluntarily, and will do only under economic constraint, which always is painful. In fact, we are now producing larger crops from fewer farms and with fewer men. This compels a certain migration from the farms to the towns. There is no way of preventing that, and there ought to be no thought of trying to prevent it, for it is the natural economic development. Anything like price-fixing or the bestowal of bounties would be like throwing gasoline on a fire.

In respect to demand, supply and price equilibrium the situation in major agricultural products is not unlike that which prevails in petroleum, which is another of our great industries, representing as it does about 11 billion dollars of invested capital. The investors in

that industry, especially in the producing companies, are not getting much return and they too would enjoy higher prices; but if anything artificial should accomplish an elevation of price there would be immediately a reswelling of the flood of oil, which is being but barely checked by the prevailing competitive price.

Neither Mr. Hoover nor Mr. Smith could talk so bluntly as this, but it summarizes what they both know, and they could not therefore discuss the agrarian question in anything but generalities which hold out no hopes for the immediate advent of good times to the tillers of the soil. Increased intelligence in planning, in operating and in marketing is desirable and will be beneficial, and the Government should and will do everything in its power to promote this, but such a program does not greatly intrigue the professional exponent of agrarian ills, who wants a sharply rising market for wheat and corn and farm lands, and wants it soon.

These Money-Saving Reforms!

ADVOCATES of simplified spelling say that the adoption of a phonetic system would save the American people 600 million dollars a year in their printing bills and 900 millions in the education of school children. The advocates of the metric system of weights and measures assert that their ideas would save us 800 or 900 millions a year. The advocates of calendar reform also have optimistic opinions, which they have not yet ventured to express in figures, but probably their estimates would be generous.

It is told that an energetic effort will be made to pass a bill for calendar reform through the next session of Congress. We are led to wonder why the advocates of spelling reform, weights and measures reform and calendar reform do not pool their issues and unite in one grand reforming bill. This would offer some excellent opportunities for log-rolling.

The estimates of the reformers in respect to the great savings they would effect do not apparently make any account of costs. Alas! It has been our experience in this pragmatic world that nobody ever gets anything for nothing. Even the promoters of wild-cat stocks and the vendors of gold bricks discover that apparent paradoxes to the contrary are always illusionary. If spelling, measuring and calendrical reforms would save us two or three billion dollars a year in our national economy, say a matter of 3 or 4 per cent of our national income, that would be indeed like a treasure-trove; but we fear the cost of the expeditions to get it.

Purchasing Agents and Profits

HOW far the buyer and how far the seller should be held to blame for price demoralization, whenever it occurs, has been much argued, generally without any helpful result. Not long ago the *Purchasing Agent* inveighed against the "myth of profitless prosperity." It challenged the common assertion that "manufacturers are making no money" and particularly absolved purchasing agents from responsibility for the condition, to whatever extent it might exist. Following up this article a like disclaimer was put in by George A. Renard, the secretary of the National Association of Purchasing Agents, in a New York

newspaper interview, in which we find this statement:

This charge was definitely refuted at a recent conference attended by the executives of thirty leading industries which do a very large business with purchasing agents. The thought developed at that conference was that, if the question of over-production is eliminated, such criticism of purchasing agents comes more from sellers who are not able to produce economically than from a real basis of complaint regarding unethical practices of buyers, and that for every so-called unethical practice of the latter many more could be cited against the sellers or their representatives.

There is something reminiscent of the old-time tariff debates in this "pot-and-kettle" aspect of the price problem. Your free trader saw a nation made up of two classes—on the one hand industrial employers and employees, and on the other hand the consumers of the products of industry. What was good for the former, it was argued, could not be anything but detrimental to the latter. But as reason entered more and more into the consideration of the issue, it came to be seen that this nation is not made up of two great camps, one containing all the producers and the other all the consumers, but rather that producers in one field are consumers of the products of another, that the members of the great industrial army have an interest as consumers in fair prices for all commodities, and that all of the millions engaged in agriculture profit by the existence of a large and well employed army of industrial workers.

Some of this comment on the comparative culpability of the purchasing agent and those who sell to him, where business is being done without a living profit, ignores the palpable fact that practically all buying by purchasing agents is for companies which in turn are sellers. Thus the secretary of the purchasing agents' organization, in what he says above, is really charging that for every unethical practice of the purchasing agent of a seller many more could be cited against the salesmen of that identical seller. In other words, he seems to say that the act of selling is a much more serious strain upon the ethical fiber of the average human than the act of buying; and as to that there will be general agreement.

On the charge which the *Purchasing Agent* repels—that buyers' agents would "squeeze the last vestige of profits from their suppliers"—fairness compels at least the Scotch verdict. But "profitless prosperity" being so apt a coinage and having so many grains of truth in it, why try to make it out to be altogether a myth?

WITH the end of the great war nearly ten years back, the Russian steel industry is at last getting to its feet again. The National Federation of Iron and Steel Manufacturers in London, England, reports Russian pig iron output for the first quarter of this year at 272,300 gross tons per month, a gain of about 25,000 tons per month over the 1927 rate. In steel the showing is better—354,000 tons per month for the first three months of the year, a gain of 50,000 tons per month over the rate of a year previous. While pig iron output this year is about 20 per cent under its pre-war volume, steel is only 11 per cent below the rate for 1913 when the steel ingot total was about $4\frac{3}{4}$ million tons. That

Russia could have reorganized its steel industry and brought it to a degree of activity so nearly approaching that of pre-war time will surprise many who have looked skeptically upon every effort of Sovietism to bring order out of chaos. On such a record one need not doubt that the country in the near future will be largely self-contained as to steel and that central and western European steel works, those of Germany in particular, will have to look elsewhere for much of the outlet in heavy steel products which they have found for nearly ten years beyond the Baltic and the Dniester.

Light Gains in Automobile Output

RECENT statistics of automobile production are particularly interesting on account of the complications due to the Ford stoppage in May of last year and the recent slow gain, as well as the recent heavy sale of other makes on account of new models. A superficial glance at the statistics may easily mislead to a belief that assumed arrearages are being made up. June and July made large gains over production of a year previous and also made new records for those months, but they gained over the previous records by only about 2 per cent.

It is the longer swing that counts, and the best view is obtained by comparing twelve-month totals. Such totals, of production of passenger automobiles and trucks in the United States and Canada, have been as follows:

12 Months Through July	Total Production
1925.....	4,006,806
1926.....	4,633,353
1927.....	4,120,033
1928.....	3,841,364

No one is likely to attribute to business conditions or the state of general prosperity the decreases in the last 24 months. To be precise, it may be mentioned that it was in October, 1926, that production began to fall below that of a year previous, and thus one may say that decreases began 22 months prior to the present month.

The two influences to be considered are a decrease in the number of new users developing year by year, in an approach to what used to be called "the saturation point," and also that some buyers have been waiting for delivery of the new Ford model. The former can be studied by way of the latter. Exploring the statistics, production in the 12 months through July, 1926, may be taken as a basis, to see what comes of it. Assuming for argument that such production represented a rate, a continuance of that rate during the following 24 months would have given 1,305,000 greater production than has occurred. The arrearage due to people waiting on the new Ford cannot possibly be so great. To produce 1,250,000 Fords in ten months would require 3500 daily in the present month, rising by 500 daily month by month to 8000 next May.

Undoubtedly there is a substantial arrearage, but one cannot avoid the conclusion that the best rate of the past will not in the nearby future be averaged for any great length of time. At present the rate is very high. June showed a total of 425,366 and July 415,671, representing an annual rate of 5,050,000. In the four years, 1923 to 1926, inclusive, June and July production averaged 2 per cent above the calendar year average

rate. Thus it is fair to say that production in June and July of this year typified a 5,000,000 annual rate. We have entered a period of exceptionally heavy production, which is likely to last for quite a while, but a permanent

rate materially exceeding that of two years and more ago is hardly to be expected. What might be called a permanent or regular rate will come when the new Ford is well in and the old Fords are well out.

American Export Ideas Adopted

Mechanical Engineers Act on Cable Code—Greatest Need of Aviation Said to Be Flying Instructors

ST. PAUL, MINN., Aug. 27.—Of prime interest to export competition were the results achieved by the representatives of the American Society of Mechanical Engineers at the recent meeting at the Hague of the International Electrotechnical Commission. The society, which is holding a summer convention in this city, had been appointed secretariat for the mechanical standards—which for the moment at least are receiving major attention.

According to information divulged in the meeting of the council of the Society today, American ideas were accepted to a marked degree, such as the common American provisions for overloads in such machinery as steam turbines. No similar basis in designs for prime movers was offered by European builders.

The organization's representatives in the Holland deliberations were Francis Hodgkinson, Westinghouse Electric & Mfg. Co.; I. E. Moulthrop, Boston Edison Electric Illuminating Co., and C. B. LePage, assistant secretary of the society, in charge of standards.

The council approved the proposed simplification of cable codes, authorizing the secretary to notify the Federal Trade Commission to that effect, with a proviso that cable charges must not be increased and thus add to export costs. The society approves five-letter code words instead of 10-

letter words, provided those foreign countries which so largely own or control telegraph lines do not charge more than one-half the present rate for 10-letter words.

Favorable action was also taken recommending officially the plan of the American Arbitration Association to settle commercial disputes without recourse to law.

W. B. Stout, president Stout Metal Airplane Co., Dearborn, Mich., held the sustained interest of a large audience with an address covering, in part, the future of aviation. In five years, according to Mr. Stout, the airplane will barely be recognized from those in use today. Ten hours suffices for training one to drive an airplane, and so, he said, there is a great need of trainers and of moderately priced training planes, particularly as the present available supply is 15 to 20 times the number of aviators qualified to run them. He looks for the Diesel motor to be applied to aviation.

Automobile Production Still at High Rate

NEW YORK, Aug. 27.—*Automotive Industries* this week will say:

"Continuance of automotive manufacturing in September at a rate exceeding 400,000 cars a month is practically assured by the large number of orders which will be carried over into that month by leading car manufacturers. Orders for models presented during the last two months have run far ahead of factory production capacity, demand in recent weeks having been almost as heavy as in the days immediately following the car introductions.

"Combined production figures of United States and Canadian factories in July show a total output of 415,671, comparing with 425,114 in June and with 279,472 in July last year. All indications at this time are that the August total will surpass July, though the excess over August, 1927, will probably be smaller.

"Reports from the field indicate not only that dealer stocks are small but that they are practically non-exis-

tent. This applies particularly to those dealers handling recent new model cars, though demand for cars of earlier introduction has been consistently large. Used car stocks generally are at much lower figures for the season than in recent years and buying is holding closely to the level of new car buying. Dealers throughout the country express conviction of a maintenance of the buying movement well into the last quarter."

Air Furnace Brick Reduced to Two Dozen Sizes

"Malleable Foundry Refractories" is the title of Simplified Practice Recommendation R79-28 recently issued by the Bureau of Standards. The standards contained have already been accepted by 45 manufacturers of fire brick and 82 malleable iron foundries. They list two sizes of door-opening tiles, three tap-out blocks, five 13½-in. bungs for roofs, six circle bricks for stacks ranging from 24 to 84 in. diameter, and eight shapes for general work, viz., 9-in. straight, soap,

split and large straight, No. 1 and No. 2 arch and No. 1 and No. 2 wedge.

Upon depletion of the present stocks, all other sizes shall be considered by the manufacturers as specials, and extended delivery dates may be expected.

Pittsburgh Shippers to Inspect Water Routes

To focus attention on the importance of wharf and river terminal development in order that the community may benefit by the Ohio River improvements which will be completed next year, the shippers' council of the Chamber of Commerce of Pittsburgh is arranging to take a large group of industrial leaders, business men and public officials on an all-day inspection tour of the three rivers within the Pittsburgh district Thursday, Sept. 6. The steamboat Julia Belle Swain has been chartered for the trip. It will go up the Monongahela River as far as Clairton, down the Ohio to Ambridge and up the Allegheny to Aspinwall. Terminals along the route will be inspected.

Iron and Steel Traffic on Ohio River Surveyed

WASHINGTON, Aug. 28.—The results of a traffic survey to discover the available traffic, in lots of 100 tons and over, into and out of Ohio and Mississippi River points between Pittsburgh and New Orleans, have just been compiled by the transportation division, Department of Commerce. Iron and steel products, exclusive of tin plate, are rated as having available 3,053,279 net tons from 21 cities along or near to the Ohio River, this amount being almost half of the total of 6,638,766 tons for all commodities. Tin plate is rated with 141,020 tons, and coal and coke with 577,000 tons, while the total given for fluorspar is 111,500 tons. Of the 21 cities, Pittsburgh leads the list in the amount of tonnage available, the total being 1,447,477, while Wheeling, W. Va., ranks second, with 1,159,697 ton, and Cincinnati third, with 933,260 tons.

The request for the survey was prompted by the belief that a barge line specializing in freight in quantity lots of 100 tons, or even 500 tons, could operate with a small overhead and the many shippers having such bulk freight available would have their own terminals. This scheme of operation, with large volume and small overhead, it was pointed out, promised water transportation with low rates.

Iron and Steel Markets

Further Advances in Pig Iron

Foundry Iron Prices Raised at Birmingham, Chicago, St. Louis
and Buffalo—Another Rise in Heavy Steel Scrap
at Pittsburgh—Steel Output Maintained

THE upward trend of prices in the iron and steel market has been given further impetus by the growing strength of primary materials. Advances in pig iron have been accompanied by heavy sales, and scrap prices continue to rise. Business in finished steel is mainly in specifications against contracts, and, notwithstanding scattered concessions on large current orders, mills appear determined to establish the price increases announced for the fourth quarter.

Foundry pig iron prices have gone up 75c. a ton at Birmingham, 50c. a ton at Chicago and St. Louis, and 50c. to \$1 at Buffalo. Pig iron sales for the week totaled 73,000 tons at Cleveland, 60,000 tons at Chicago and 50,000 tons in the Valleys, while commitments for the country at large were well over 275,000 tons.

Furnaces are accumulating comfortable backlogs, some of them being booked for the rest of the year. Considerable tonnage in large inquiries is still pending, and an increasing number of small melters who have been limiting purchases to immediate needs are now seeking contracts through the next quarter.

Heavy steel scrap at Pittsburgh has again advanced 50c. a ton, making a total gain of \$2 since the low point was reached in July. The shortage of steel works scrap is still acute, as reflected in competition among dealers for material to fill their orders.

Output of finished steel products remains at a high level. Ingot production at Chicago is now 80 per cent of capacity, compared with 75 per cent last week. In the Greater Pittsburgh area the rate is between 80 and 85 per cent. The average of the various Steel Corporation subsidiaries, at 75 per cent, has shown only slight variation for several weeks.

Shipping orders, although declining in some products, have increased in others. Gains in sheet specifications, as well as fresh orders for delivery this quarter, apparently reflect a desire to take advantage of the 2 per cent discount for cash payment, which expires Oct. 1. In some cases consumers are buying enough to cover all of their probable needs through the rest of the year.

Releases against contracts for shapes, bars and plates are also heavy, and it is likely that little tonnage will remain unspecified on Sept. 10. Following the practice recently established, fourth quarter contracts for plates, shapes, bars and sheets will contain a clause calling for complete specifications by Dec. 10.

Contracting for the fourth quarter is still of negligible proportions. Concessions have been reported on attractive current tonnages of sheets and heavier rolled products, but these do not preclude adherence to the

price advances announced for the next three-month period. The building up of large backlogs before assuming a stronger position on prices is not without precedent.

Price competition has been keen for pipe line tonnage, particularly between makers of lapweld and electrically welded pipe. Three gas and two oil lines, calling for a total of 1500 miles of pipe, are pending.

The latest price advance for fourth quarter delivery is an increase of \$2 a ton on alloy steel bars. While the new price becomes effective immediately, consumers are generally covered for the current quarter.

In tin plate, a product contracted for by the year or half-year, no change in prices can be expected before the end of December. A reduction in the price for 1929 is a possibility, in view of the decline in pig tin. A seasonal recession in specifications points to a tapering of tin plate output within 30 days. Production for the year will probably be a record, however.

A probable offset to the expected decline in tin plate output is the expanding production of wire products. Wire mill operations have increased to 65 per cent of capacity, and a further gain is indicated. Some makers of wire products have announced that present prices will be continued for the fourth quarter.

Chicago structural fabricators have in prospect 150,000 tons of steel work which may be awarded before the end of the year, this including 74,000 tons for the new Apparel Mart. A furniture building and a rubber plant in Toronto, Ont., one taking 12,000 tons and the other 4000 tons, account for nearly half of the 37,500 tons of structural steel awards in the week.

Railroad buying has taken a more prominent place in the steel market through the purchase of 55 locomotives by the New York Central, 6000 tons of rails by the Missouri-Kansas-Texas and 9000 tons of plates by the Chesapeake & Ohio for car repairs. The latter road will also buy 45,500 tons of rails and 14,000 tons of accessories.

Export shipments of steel have gained appreciably and help explain the high rate of output of those mills that specialize in foreign trade. Exports of iron and steel last month were 33 per cent larger than in July, 1927.

THE IRON AGE composite for pig iron has advanced to \$17.34 a ton, a gain of 30c. over the price prevailing in the previous five weeks, the lowest level reached this year. The finished steel composite is unchanged at 2.348c. a lb.

Steady Flow of Specifications on Third Quarter Contracts— Heavy Pig Iron Buying—Scrap Prices Higher

PITTSBURGH, Aug. 28.—The flow of specifications on third quarter contracts still is steady and strong to steel manufacturers in this and nearby districts and finishing mill operations remain at a rate that requires an ingot production of between 80 and 85 per cent of capacity. Makers of seamless pipe have enough business to keep them well engaged for the remainder of the year and the situation is much the same in large outside diameter pipe for oil and gas lines. Shipping instructions on sheets are pouring in freely and almost invariably the promptest possible delivery is asked. Tin plate has begun to slow up, as usual at this time of the year, but as a partial offset to that is the fact that wire products are moving a little better than they did last month. There is no let-down in the movement of strips on old orders, nor are cold-finished steel bars yet reflecting any recession in the high rate of activity of the automotive industry, the principal outlet for these products. The shipments of the heavy tonnage products leave little to be desired.

From the standpoint of plant engagement and the way consumers are ordering out their purchases, the situation has rarely been more favorable, especially at this time of the year. But most of the tonnages are moving at what are commonly said to be unsatisfactory prices. In that connection, however, there is a very general effort to bring about an improvement on supplies that will be wanted for the final quarter of the year. It is early

for much of a test, but in the face of the announcement made early in July that the fourth quarter price of bars, plates and shapes would be 2c., base Pittsburgh, there is some concern over the fact that on a railroad inquiry, 1.90c. was the common quotation and only a few mills placed any limitation upon the date of acceptance of specifications on the order.

It develops that quotations of 3.60c., base, on galvanized sheets on fourth

quarter business are for small lots and that the quotation to jobbers and large consumers is 3.50c. No fourth quarter business of consequence yet has been booked in sheets. Makers of alloy steel bars have advanced the base price from 2.65c. to 2.75c., making no changes in alloy differentials.

Higher prices are being sought by at least one maker of foundry iron as a result of good-sized sales of that grade in the past week, one of which was 16,000 tons. Pig iron sales in general have reached the heaviest total in many weeks, but the business was done at recent prices and the market is firmer only to the extent that producers now are well supplied with business and naturally a little less eager for additional tonnage.

Scrap prices again are headed higher; the short interest in the steel works grades has not been materially reduced and with no let-down in steel works operations or requirements, scrap dealers find it necessary to bid high to cover their sales. The rise from the recent low point in heavy melting steel is \$2 a ton or more, and it is predicted that a further advance will be registered on the railroad scrap to be awarded next week.

Pig Iron.—The Valley-Pittsburgh iron market has had the most active

week in several months, with total sales of approximately 50,000 tons, but prices do not appear to have been appreciably strengthened by this large turnover. On the contrary, competition for business was sufficiently active to defeat efforts made by some producers to secure an advance over recent prices and the quotable market is just where it was a week ago. The Standard Sanitary Mfg. Co. figures in the week's business to the extent of 16,000 tons of No. 2 and No. 2X iron for shipment over the next four months to its Pittsburgh and New Brighton, Pa., plants. Most of this was sold at \$16.50, Valley furnace, for both grades, but for a small part of the higher silicon iron \$16.75 was paid. Other sales of foundry iron, including one of 1500 tons to a Greensburg, Pa., melter, and probably reaching a total of more than 5000 tons carried the same prices. Basic iron has figured to an even larger extent in the week's business. The Allegheny Steel Co. was a buyer of 18,000 tons, the Edgewater Steel Co. of 5000 tons and the American Steel Foundries for its Alliance, Ohio, plant of 2000 or 3000 tons. This iron was sold at \$16, Valley furnace, or the equivalent from other points of origin, efforts to obtain more having been unsuccessful. While small lots of Bessemer iron have been sold at \$17.25, Valley furnace, a good deal more has changed hands at the recent quotation of \$17. Several producers now have fair-sized backlogs as a result of the week's business and one merchant producer has announced an advance of 50c. on foundry iron to \$17, Valley furnace, for No. 2 and has renamed the former silicon differentials of 50c. per half point of silicon, quoting No. 2X iron at \$17.50 and No. 1 grade at \$18. This action, however, has not yet been followed by other producers. An inquiry for 4000 tons of malleable iron is reported.

Prices per gross ton, f.o.b. Valley furnace:

Basic	\$16.00
Bessemer	17.00
Gray forge	\$16.25 to 16.50
No. 2 foundry	16.50 to 16.75
No. 3 foundry	16.25 to 16.50
Malleable	17.00
Low phos., copper free	26.50

Freight rate to Pittsburgh or Cleveland district, \$1.76.

Ferroalloys.—Consumers are taking unusually steady shipments against contracts for the various ferroalloys. The occasion does not exist, however, for supplementary tonnages and new business does not amount to much. The Ford Motor Co., recently in the market for 400 tons of 14 to 16 per cent ferrosilicon, is understood to have placed the order with a Western producer.

Semi-Finished Steel.—Shipments of billets, slabs and sheet bars on contracts leave little to be desired either from the viewpoint of steadiness or volume. Tin plate demands are somewhat smaller, and some recession of mill operations is likely toward the end of next month, but sheet mill operations remain high. Strip mill engagement also is fairly full. No announcement yet has been made as to fourth quarter prices of billets and slabs, but several makers of sheet bars have announced \$33, f.o.b. Pittsburgh or Youngstown, on sheet bars. There is an impression that delay in naming last quarter prices on billets and slabs is due to a desire to see whether an advance in strips is going to hold, since it has been pretty clearly demonstrated that prices of semi-finished steel cannot be sustained in a tendency contrary to that in the finished products. Producers, having recently formulated chemical extras, which they want to make part of fourth quarter contracts and which weigh a little more heavily upon billets and slabs than upon sheet bars, no doubt also wish to be certain that the new charges are acceptable to non-integrated manufacturers. Wire rods are firmly held at \$42, base, both for current and fourth quarter business.

Rails and Track Supplies.—A local mill will furnish the 6000 kegs of spikes recently inquired for by the Norfolk & Western Railroad. Otherwise, business in track supplies is moderate, although there is a fairly steady movement on old orders. Standard-section rails are quiet as usual at this time of the year and demand for light-section rails leaves much to be desired.

Wire Products.—August is proving to be a better month in point of sales

than either July this year or August last year. It is said here that most of the low-priced nails and wire shipped earlier in the year have passed into consumption and the competition set up by these tonnages to the efforts of mills to raise prices no longer amounts to much. There are no deviations reported from the July 5 schedule, which has been announced as the one to apply on fourth quarter contracts by several producers. Spring dating terms have been announced on woven wire fence, effective from Sept. 3 in the Southern territory and from Nov. 5 in the North; they call for 2 per cent discount for payment by May 10 in the North and net on July 1, while in the South the terms read net May 1 and 2 per cent discount for cash by March 10, 1929.

Tubular Goods.—Makers of seamless oil well pipe have enough business to keep productive capacity well engaged over the remainder of the year. There is also a backlog of fairly large proportions in line pipe and a good prospect of additions to the order books. But in other classes of pipe, business leaves something to be desired. There is only a moderately active demand for the butt-weld sizes and lap-weld pipe still feels the lack of oil well development work in the fields where lap-weld pipe will fill the bill. Large lap-weld pipe furnaces are running substantially at capacity and that also is the case with seamless pipe mills, but the general average is reduced by the low rate of small pipe mill engagement to about 70 per cent.

Sheets.—Specifications against third quarter contracts still are pouring in freely and an interesting feature is that most of them carry rush shipment instructions. It is not clear whether the requirement is urgent or that, because consumers are going along with a minimum stock, they request prompt shipment to be insured of having supplies constantly en route. The American Sheet & Tin Plate Co. last week had only a few tons less in total specifications than in the two previous heaviest weeks of the year. Demands of the automobile industry and the agricultural implement manufacturers are notably heavy. Not much fourth quarter con-

Carbon Vanadium	0.95	3.60

Above prices are for hot-rolled steel bars, forging quality. The ordinary differential for cold-drawn bars is 1c. per lb. higher. For billets 4 x 4 to 10 x 10 in., the price for a gross ton is the net price for bars of the same analysis. For billets under 4 x 4 down to and including 2½ in. squares, the price is \$5 a gross ton above the 4 x 4 billet price.

Slabs with sectional area of 16 in. or over carry the billet price; slabs with sectional area of 12 in. to 16 in. carry a \$5 extra above the billet price and slabs with a sectional area under 12 in. carry the bar price.

Band sizes are 40c. per 100 lb. higher.

Rails

Per Gross Ton

Standard, f.o.b. mill	\$43.00
Light (from billets), f.o.b. mill	36.00

2	53	42½	2	23	9
2½ to 4	57	46½	2½ to 4	29	15
4½ to 6	56	45½	4½ to 6	28	14
7 to 8	52	39½	7 to 8	21	7
9 and 10	45	32½	9 to 12	16	2
11 and 12	44	31½			

On carloads the above discounts on steel pipe are increased on black by one point, with supplementary discount of 5%, and on galvanized by 1½ points, with supplementary discount of 5%. On iron pipe, both black and galvanized, the above discounts are increased to jobbers by one point with supplementary discounts of 5 and 2½%.

Note.—Chicago district mills have a base two points less than the above discounts. Chicago delivered base is 2½ points less. Freight is figured from Pittsburgh, Lorain, Ohio, and Chicago district mills, the billing being from the point producing the lowest price to destination.

Boiler Tubes

Base Discounts, f.o.b. Pittsburgh

Lap Welded Steel	Charcoal Iron
2 to 2½ in.	27
2½ to 2¾ in.	37

2½ and 2¾ in.	48	4 in.	59
3 in.	54	4½, 5 and 6 in.	48

Less carloads, 4 points less. Add \$8 per net ton for more than four gages heavier than standard. No extra for lengths up to and including 24 ft. Sizes smaller than 1 in. and lighter than standard gage to be held at mechanical tubes list and discount. Intermediate sizes and gages not listed take price of next larger outside diameter and heavier gage.

Seamless Mechanical Tubing

Per Cent Off List

Carbon, 0.10% to 0.30%, base (carloads)	55
Carbon, 0.30% to 0.40%, base	50
Plus differentials for lengths over 18 ft. and for commercial exact lengths. Warehouse discounts on small lots are less than the above.	

tracting has been done, but on such business makers generally are quoting 2.75c., base Pittsburgh, on black; 3.50c., base, on galvanized; 4c., base, on body sheets; 2c. and 2.10c., base, according to width, on blue annealed, and 2.90c., base, for tin mill black.

Tin Plate.—New business is not keeping pace with completed orders and while mill operations are well up to full capacity, some recession is looked for in the next 30 days. This is merely a seasonal condition, as the requirements for packers' cans are usually well supplied by this time.

Cold-Finished Steel Bars and Shafting.—Consumers and jobbers are specifying very steadily on third quarter contracts. Not much new business is being done, as requirements are being supplied to a large extent from tonnages under order and it is early for fourth quarter contracting, since the price for that period has not yet been announced. Most shipments are at 2.10c., base, with makers asking 2.20c., base, on new business.

Hot-Rolled Flats.—Cooperage stock prices have been somewhat unsettled lately as a result of a cut of \$2 a ton in the Chicago district to 2.40c., base, this resulting in a similar drop to 2.20c., base Pittsburgh. Makers quoting on a Pittsburgh base, however, are again quoting 2.30c., base, and, as it is understood that the Chicago base is to remain at 2.40c., the spread between the two markets becomes \$2 a ton, instead of \$4, as formerly. Makers of strips are quoting 1.90c. for widths of 6 to 12 in., 2c. for 3 in. to less than 6 in., and 2.20c. for less than 3 in. widths on new business for either prompt or fourth quarter shipment. For wide strips the plate or blue annealed sheet bases govern prices, the plate price being taken as 1.90c., base, and the blue annealed sheet base as 2c. These prices are yet to be seriously tested, as new business constitutes

only a small part of the current shipments. Makers still report good specifications on third quarter contracts.

Cold-Rolled Strips.—Makers generally have gone along with the plan to substitute 3 tons or more as the base tonnage for 1 to 3 tons, and the common quotation for new business for either prompt or fourth quarter shipment is 2.85c., base Pittsburgh. Lots of 1 to 3 tons now call for an extra charge of 25c. per 100 lb. Consumers are freely releasing tonnages they have under contract, carrying prices of 2.65c. to 2.75c., base, for lots of 3 tons or more.

Bars, Plates and Shapes.—Prices named on the recent inquiry of the Pennsylvania Railroad for 25,000 tons of bars, plates and shapes have occasioned considerable discussion, and while manufacturers still insist that the fourth quarter price on these products will be 2c., base Pittsburgh, the fact that the railroad was able to get protection for the remainder of the year at 1.90c. has created the idea among buyers that the latter price is more likely to be the ruling one, with 2c. to be the small-lot figure. Specifications on old orders for bars and shapes still are large and plates also are doing well. Strictly new business still is light, because of the general coverage of buyers for this quarter, while only moderate interest yet is evidenced in fourth quarter requirements until it is seen whether the market is actually going to the announced price for that period.

Bolts, Nuts and Rivets.—Production is running close to 60 per cent of capacity. This is an increase of 10 points over the rate of a month ago and in view of close range buying is a fair measure of the increase in demand.

Coke and Coal.—Spot supplies of beehive oven furnace coke still are light and the market is firm at \$2.75 per net ton at ovens. Spot foundry coke is plentiful. The coal market presents nothing in the way of new features. Production is still ample for all requirements and there is not much strength to prices.

Old Material.—Prices have resumed their upward trend and average 50c. a ton higher than a week ago on the open-hearth grades, the strength of which has had a tendency to lift other grades. Renewed pressure on the part of steel makers for deliveries on orders placed some time ago has forced the dealers to buy, and as much as \$16.50 delivered at one point in the district has been paid for railroad heavy melting steel, while other sales to dealers are noted at from \$15.50 to \$16.25, the destination having much to do with the price. The short interest in heavy steel scrap has not been materially reduced, and, as mill stocks are light, there is rather constant pressure for shipments on contracts. Producers of scrap are impressed by the possibility of even higher prices and are not offering much, while prices are too remunerative east and west of Pittsburgh for much scrap

to come through from those directions. In view of these circumstances, there is more than the usual dependence upon railroad lists, and it is expected that the heavy melting steel in September lists will go at \$16.50 or \$17. There are shortages of scrap in this district and in Youngstown, with both dealers' and consumers' yard piles very low; only an abatement of the pressure for deliveries, it appears, will prevent still higher prices. There are suggestions that the ratio of iron to scrap in the open-hearth charge will be increased, but there are no signs of blast furnace resummptions. The September scrap list of the Pennsylvania Railroad contains 41,075 net tons.

Prices per gross ton delivered consumers' yards in Pittsburgh and points taking the Pittsburgh district freight rate:

Basic Open-Hearth Grades:	
Heavy melting steel.....	\$15.50 to \$16.50
Scrap rails	15.00 to 16.00
Compressed sheet steel....	15.00 to 15.50
Bundled sheets, sides and ends	14.00 to 14.50
Cast iron carwheels.....	15.00 to 15.50
Sheet bar crops, ordinary.....	16.00 to 16.50
Heavy breakable cast.....	12.25 to 12.75
No. 2 railroad wrought.....	16.00 to 16.50
Heavy steel axle turnings.....	14.50 to 15.00
Machine shop turnings.....	10.00 to 10.50

Acid Open-Hearth Grades:	
Railr. knuckles and couplers.....	16.50 to 17.00
Railr. coil and leaf springs.....	16.50 to 17.00
Rolled steel wheels.....	16.50 to 17.00
Low phos. billet and bloom ends	19.50 to 20.00
Low phos., mill plates.....	18.00 to 18.50
Low phos., light grade.....	17.00 to 17.50
Low phos., sheet bar crops.....	18.00 to 18.50
Hvy. steel axle turnings.....	14.50 to 15.00

Electric Furnace Grades:	
Low phos. punchings.....	16.50 to 17.00
Hvy. steel axle turnings.....	14.50 to 15.00

Blast Furnace Grades:	
Short shoveling steel turnings	11.00 to 11.50
Short mixed borings and turnings	11.00 to 11.50
Cast iron borings	11.00 to 11.50
No. 2 busheling.....	10.00 to 10.50

Rolling Mill Grades:	
Steel car axles	18.50 to 19.00
No. 1 railroad wrought.....	12.00 to 12.50
Sheet bar crops	16.50 to 17.00

Cupola Grades:	
No. 1 cast.....	14.75 to 15.25
Rails 3 ft. and under.....	16.50 to 17.00

Acquire Bridgeport Chain Co.

The Bridgeport Chain Co., Bridgeport, Conn., maker of weldless wire and flat metal chain, upholstery and torsion springs, wire specialties and metal stampings, has been purchased by the Round interests of Cleveland, which also control the Cleveland Chain & Mfg. Co. and David Round & Son, Cleveland, the Krein Chain Co., Wapakoneta, Ohio, and the Seattle Chain & Mfg. Co., Seattle, Wash. The Bridgeport company will be operated in the future under name of the Bridgeport Chain & Mfg. Co., with L. D. Round as president and L. D. Cull, secretary and treasurer. The business will be enlarged by the addition of welded chain of all sizes, chain hoists and tire chains. The upholstery and bed spring business will be continued as a separate business at the same location and all spring business will be transacted from the same office.

Milled studs	70 and 5

Chicago

Steel Production Increased Following Liberal Releases Against Contracts—Pig Iron Advanced 50c.

CHICAGO, Aug. 28.—Steel ingot production in the Chicago district has been increased not less than five points, or to 80 per cent of capacity, following more liberal releases by a broad classification of users. The expansion in specifications promises to sustain output at the new rate. August is proving to be an unusually good summer month from the viewpoint of steel shipments and it is not improbable, according to the views of local steel producers, that it will take its place with the previous seven months to make the first eight months of this year equal to or slightly better than previous records. Heavier specifications are affording better rolling schedules, though some complaint still is heard that mill costs are unduly high because of frequent roll changes.

Larger releases are in part accountable to announcements of advances in prices for the fourth quarter and the resultant anxiety of buyers to make full use of present contracts. At the same time, the fact should not be overlooked that industry in general is at a higher pitch. Less resistance is being offered to prices asked for fourth quarter, but considerable opposition has arisen against the change in the rate of discount on sheets and cold-rolled strip.

Outstanding among prospective purchases of reinforcing bars is 12,000 tons for the Apparel Mart, Chicago. The United States Gypsum Co. has placed an order for 600 tons of rail steel reinforcing bars for a new plant at East Chicago, Ind.

Pig Iron.—Pig iron sales in this district have topped 60,000 tons in the last week. The bulk of this tonnage was placed early last week prior to the announcement by local producers of a 50c. advance in prices for Northern foundry iron. Following three weeks of heavy purchases, it is evident that melters are well covered for the next four months but the increase in melt leads producers to believe that users have estimated requirements too closely. A Federal furnace, ready for blowing, probably will be lighted within the next two weeks. In some quarters the thought is expressed that part of the recent buying was speculative, but this is discounted somewhat by the fact that melters generally report business much improved, this being particularly true of the malleable foundries, and pressure for prompt and increased shipments is insistent.

Prices per gross ton at Chicago:

N'th'n No. 2 fdy., sil. 1.75 to 2.25..	\$18.00
N'th'n No. 1 fdy., sil. 2.25 to 2.75..	18.50
Malleable, not over 2.25 sil.	18.00
High phosphorus	18.00
Lake Super. charcoal, sil. 1.50.....	27.04
So'th'n No. 2 fdy. (all rail).....	22.26
So'th'n No. 2 (barge and rail).....	21.76
Low phos., sil. 1 to 2, copper free	\$28.50 to 29.00
Silvery, sil. 8 per cent	29.79
Bess. ferrosilicon, 14-15%.....	46.79

Prices are delivered consumers' yards except on Northern foundry, high phosphorus and malleable, which are f.o.b. local furnace, not including an average switching charge of 61c. per gross ton.

Ferroalloys.—Shipments of 50 per cent ferrosilicon to users in this district are measurably heavier than those of a year ago. The last of a cargo of foreign spiegeleisen has been

closed out at \$32, Hazard, Pa., and it is understood that only the domestic commodity is now available.

Prices delivered Chicago: 80 per cent ferromanganese, \$112.56; 50 per cent ferrosilicon, \$83.50 to \$87.50; spiegeleisen, 19 to 21 per cent, \$40.76.

Plates.—Oil storage tank orders this week call for 5500 tons of plates, of which 3500 tons will be fabricated and erected in the Southwest. Efforts to control petroleum output in several of the Western States are becoming more effective, but to date this move has had little or no influence on the requirements of storage capacity, largely because much of the new construction is taking place in recently developed fields. The report here last week that the Texas & Pacific had closed in the East for 3000 tons of tankage material appears to have been an error, for it is now asserted that the United Iron Works, Kansas City, Mo., is low bidder on this tonnage. It is understood here that the water pipe project in Denver, Colo., calling for 12,000 tons of steel, will soon come up for figures. The railroad equipment market remains for the second week moderately active in small orders. The North American Car Co. has ordered 100 underframes and the Barrett Co. has purchased 10 tank cars. The American Car & Foundry Co. has taken an order for 10 hopper cars from the Wabash. The Sanitary District of Chicago has rejected all bids on 54 air dump cars and has issued new inquiries for 16 30-yd. cars and 4 of 20 cu. yd. capacity. Chicago prices for plates are steady at 2c. on the general run of business. On specific orders of attractive tonnage, especially when competition among fabricators is keen, 1.90c. is being done. Mill books are open at 2.10c. for tonnages that are to be delivered after Sept. 30.

Mill prices on plates, per lb.: 2c. base Chicago.

Structural Material.—Preliminary estimates of the steel that will be needed for the Apparel Mart, Chicago, place the tonnage at 74,000 tons. It is now planned that construction on this structure is to be begun about Feb. 1, 1929. Taking the above tonnage into consideration and projects that are actively before the local trade, there is not less than 150,000 tons which is reasonably assured for Chicago and Milwaukee shops by Jan.

1. Awards during the week totaled 6000 tons, including 3000 tons for lock gates for the Illinois Waterway Commission. Noteworthy among fresh inquiries is 1900 tons for a new mill building for the Interstate Iron & Steel Co., Chicago. Shops in Chicago are well supplied with work for the next four to six weeks, but output schedules are overbalanced on the side of heavy tonnage orders. Evidence is at hand that prices asked by fabricators for large jobs have stiffened and are holding in the face of strong opposition by architects and contractors. The desire to round out shop operations by booking small tonnages is holding prices low on that kind of work. Specifications to mills for structural materials are heavier as buyers watch the tendency in fourth quarter prices and show greater anxiety to take their full contract obligations for delivery before Sept. 30.

Mill prices on plain material, per lb.: 2c. base, Chicago.

Bars.—Shipments of mild steel bars in August are running well ahead of July and the outlook is that deliveries will be heavier as users issue larger specifications in order to complete third quarter contracts. Reports that the automobile industry is slowing down are not substantiated by orders to local mills. Several new models are still to come out and from those plants orders are running lighter, but in other directions specifications are larger and net result is that from the viewpoint of Chicago producers there is little or no variation in the total output by the automobile industry. Deliveries of bars range from two to five weeks, the more extended time being necessary on a number of the special sizes called for by forgers and automobile parts manufacturers. Several scattered sales are reported at 2.10c. per lb., Chicago, for delivery in the fourth quarter. The iron bar market is quiet. Alloy bar mill schedules are well maintained by a steady flow of orders for practically all classes of users. Orders for fence posts made from hard steel bars have come in more freely and local mills have had to extend hours of operation in order to hold production at a point where stock can be accumulated against the fall demand. Users of rail steel bars are running with minimum stocks and are demanding prompt delivery. Mills are promising shipments in three to four weeks.

Mill prices per lb.: Soft steel bars, 2c. base, Chicago; common bar iron, 2c. base, Chicago; rail steel bars, 1.85c., base, Chicago Heights mill.

Sheets.—New orders and specifications continue to grow and rolling schedules are now made up for 10 days to two weeks in contrast with four to six days earlier in the month. Price advances announced for fourth quarter appear not to be of as much concern to buyers as is the change in the rate of discount. Little interest has developed on fourth quarter contracts. Specifications from the roofing trade are large, but manufactur-

ers of light tanks are taking smaller quantities of sheets.

Base prices per lb., deliv'd from mill in Chicago: No. 24 black sheets, 2.80c. to 2.90c.; No. 24 galv., 3.65c. to 3.75c.; No. 10 blue ann'l'd, 2.15c. to 2.25c. Deliv'd prices at other Western points are equal to the freight from Gary plus the mill prices, which are 5c. per 100 lb. lower than Ch'go deliv'd prices.

Rails and Track Supplies.—The Chesapeake & Ohio is in the market for 45,500 tons of standard-section rails, 9000 tons of tie plates and 5000 tons of angle bars. It is estimated here that not less than 30,000 tons of this rail business will be placed with Western mills. Three Western railroads have ordered a total of 4000 tons of rails for immediate delivery. Output of rails is steady, but production of accessories is variable because of the character of orders. The light rail market is dull.

Prices f.o.b. mill, per gross ton: Standard-section open-hearth and Bess. rails, \$43; light rails, rolled from billets, \$36. Per lb.: Standard railroad spikes, 2.80c.; track bolts with square nuts, 3.80c.; steel tie plates, 2.15c.; angle bars, 2.75c.

Cast Iron Pipe.—Chicago is reported as having closed for 1920 tons of 8 and 12-in. Class B pipe at \$33.70, Birmingham, or \$41.90, delivered. The American Cast Iron Pipe Co. has taken 350 tons for Barton, Wis., and 150 tons for Kewaskum, Wis. The E. A. Meyer Construction Co. will lay 500 tons of pipe at Highland Park, Ill., and R. J. Wilson & Co., Appleton, Wis., will supply 300 tons for Winfield, Ill. Lombard and Evanston, both in Illinois, have placed orders in the last week. Several railroads are figuring on fair tonnages through manufacturers of water treating plants.

Prices per net ton, deliv'd Chicago: Water pipe, 6-in. and over, \$42.20 to \$43.20; 4-in., \$46.20 to \$47.20; Class A and gas pipe, \$4 extra.

Wire Products.—Output of wire and wire products has again been speeded up and now stands at close to 65 per cent of mill capacity. With the harvest season well advanced, there comes a larger demand from farm communities and jobbers are ordering more freely. Stocks in the hands of distributors are low and, judging by the character of purchases, they intend keeping them in that condition

for the time being. More active country trade matches closely with the rate of increase at mills and producers' stocks are not growing as the first impulse of the fall trade is being felt. Mill books will be opened for fourth quarter business about Sept. 1. Prices for wire and wire Products are given on page 537.

Old Material.—Prices in this market remain strong and sales, especially in specialties, are fairly numerous. Small users are more active and are insistent on prompt delivery for immediate use. Shipments of cast iron borings are moderately heavy, but brokers are short and are bidding high for carload lots. An industrial plant has sold 700 tons of this grade. The sustained rate of industrial activity through the summer months has held a check on the accumulation of scrap and this situation, dealers believe, points to higher prices in the early fall. On the other hand, some resistance to prices has developed among the large buyers. The Chicago, Milwaukee, St. Paul & Pacific will sell 5000 tons and the Burlington is offering 3000 tons.

Prices deliv'd Chicago district consumers:	
Per Gross Ton

Grate bars	12.00 to 12.50
Brake shoes	10.00 to 10.50

*Relaying rails, including angle bars to match, are quoted f.o.b. dealers' yards.

Reinforcing Bars.—Greater anxiety to share in going business has definitely lowered Chicago warehouse

prices for billet steel reinforcing bars to 2.20c. a lb. for large tonnages. In a few cases even this price has been shaded in recent quotations. The rail steel commodity remains steady at 2c. a lb. for large orders. Although there still is the promise of active new projects, they are slow in developing. Shops are beginning to feel the effect of this, for they are rapidly completing the large contracts on their books and cannot fill in with current small orders. Cook County, Ill., has placed contracts calling for 850 tons of rail steel bars for highway work.

Cold-Rolled Strip.—Producers announce 2.85c. per lb., Cleveland, or 3.15c., delivered Chicago, as the new base price on orders of 6000 lb. and over. The old discounts have given way to extras, which are added for items under 3 tons. Producers are engaged at 75 per cent of capacity.

Bolts, Nuts and Rivets.—Unsteadiness is noticed in prices for large rivets, especially when used for tank construction work in the Southwest. Oil storage tanks contracted for this week call for 500 tons of large rivets. Specifications for bolts, nuts and rivets are steady. Sellers are preparing to submit fourth quarter contracts at prices which it is now said will be unchanged.

Coke.—Shipments of by-product foundry coke are measurably heavier as the melt in this district grows. Prices are steady at \$8, f.o.b. local ovens.

New Sheet Discount Protested

The reduction of the cash discount on sheets and cold-rolled strip from 2 per cent to one-half of 1 per cent, which will be put into effect by virtually all mills on Oct. 1, has brought out protests on the part of some buyers both among jobbers and manufacturing consumers.

In a letter addressed to one of its main sources of supply for steel the Columbian Steel Tank Co., Kansas City, Mo., says in part:

It goes without saying that your ruling will work a hardship on the sheet metal fabricators who pay their bills promptly, to an extent that you may or may not ever learn about, as they cannot so quickly, or will not, change their policy as you did.

We feel hurt! Is there not some other recourse? Why not adopt a better policy: As one of the leaders, figure costs and base your selling price on the results obtained. No fabricator objects to mills making a profit. However, we do object to being classed with the slow-pay fabricator who knows nothing about discounts, and cares less.

One objection raised to the reduction in discount is that it will tend to delay invoice payments and thus make it necessary for the mills to employ more capital. The banks, it is argued, are quite willing to loan money to buyers for the purpose of discounting their bills when the discount is 2 per cent, but they are not likely to be so accommodating if the saving is only one-half of 1 per cent.

Philadelphia

Some Buyers Considering Last Quarter Needs—Specifications Good and Mills Well Occupied

PHILADELPHIA, Aug. 28.—For the first time in many months, deliveries are extended slightly on some products, particularly sheets and plates. This has apparently resulted from the unexpected flow of specifications against current contracts, for which mills, operating at a moderate rate, were not entirely prepared. Small orders for prompt shipment are not receiving the early action that has been usual for some months past. New buying is small, except for some contracts on blue annealed sheets by consumers and distributors who, desirous of taking final advantage of the 2 per cent discount for cash in 10 days, effective until Oct. 1, are placing at least part of their fourth quarter requirements and specifying for delivery in September. There is a moderate volume of pig iron inquiry and some small users of foundry iron, who have been buying carload lots as needed, have recently been asking if the present base price would apply on 100 tons or more to be delivered in the next quarter. Iron and steel scrap prices are still moving upward, although much of the present activity is the result of dealers seeking to cover lower priced contracts.

Pig Iron.—A return to \$20 per ton, base, on foundry grade, the eastern Pennsylvania quotation until several weeks ago, is being considered and some buyers of small lots are showing a willingness to contract for 100 tons or more for delivery in the next quarter. The Coatesville Boiler Works, Coatesville, Pa., has closed on 100 tons of foundry grade with an eastern Pennsylvania merchant furnace. A consumer of basic is in the market for its usual requirements, probably 6000 to 7000 tons, and is understood to have rejected a quotation of \$19, delivered, as too high. The Virginia pig iron producer has sold 10,000 tons of foundry iron to a Virginia cast iron pipe foundry, and is reported to have met the competition of Birmingham furnaces, which had not then advanced their prices. Low phosphorus is in fair demand and prices are firm.

Prices per gross ton at Philadelphia:

East. Pa. No. 2, 1.75 to 2.25 sil.	\$20.26
East. Pa. No. 2X, 2.25 to 2.75 sil.	20.76
East. Pa. No. 1X.	21.26
Basic (del'd east. Pa.)	\$18.75 to 19.25
Gray forge	19.75 to 20.25
Malleable	21.00 to 21.50
Stand. low phos. (f.o.b. N. Y. State furnace)	22.00 to 23.00
Cop. b'g low phos. (f.o.b. furnace)	23.00 to 23.50
Va. No. 2 plain, 1.75 to 2.25 sil.	24.04 to 24.54
Va. No. 2X, 2.25 to 2.75 sil.	24.54 to 25.04

Prices, except as specified otherwise, are deliv'd Philadelphia. Freight rates: 76c. to \$1.64 from eastern Pennsylvania furnaces; \$4.54 from Virginia furnaces.

Ferromanganese.—Consumers are taking their full contract shipments, but not much additional tonnage has appeared. The quotation continues at \$105, seaboard.

Bars.—A leading producer reports that business in this product for the first seven months of the year was more than 20 per cent greater than in the same period of 1927 and the volume of specifications is continuing at a good rate. Prices are unchanged at 1.85c. to 1.90c. per lb., Pittsburgh, or 2.17c. to 2.22c., Philadelphia, for current delivery. On contracts for the last quarter 1.90c., Pittsburgh, appears as the possible price, although 2c., Pittsburgh, or 2.32c., Philadelphia, is still discussed.

Plates.—Small orders for prompt

shipment are beginning to be delayed and consumers in some cases are pressing for deliveries. The Virginia Bridge & Iron Co., Roanoke, Va., has closed on 5000 to 6000 tons of plates with a Pennsylvania mill, and the Chesapeake & Ohio has purchased about 9000 tons of plates, which also went to a mill in this district. Prices continue at 2c. to 2.05c., Coatesville, or 2.10c. to 2.15c., delivered Philadelphia; 2.05c., Coatesville, appears as the probable fourth quarter contract price, although in some quarters 2.15c., Coatesville, is suggested.

Shapes.—Fabricating shops are well filled with tonnage, but fabricated steel prices show no tendency to advance. One fabricator is booked with sufficient bridge tonnage for the remainder of the year and another shop has orders for delivery over the next seven months. Shape prices are slightly stronger at 2.05c., Pencoyd, or 2.11c., Philadelphia, but 1.95c., Pencoyd, or 2.01c., Philadelphia, has not entirely disappeared.

Sheets.—To secure the last possible advantage from the 2 per cent discount for cash in 10 days, effective only until Oct. 1, buyers are in some cases contracting for all or part of their last quarter requirements of blue annealed sheets and automobile body

sheets, specifying for delivery in September. One maker of highly finished sheets is not yet reported to have announced its intention of reducing the cash discount to one-half of 1 per cent on Oct. 1. Mills are beginning to extend deliveries slightly and show no inclination to recede from their announced intention of contracting for fourth quarter at 2c. to 2.10c., Pittsburgh, for blue annealed; 2.75c., Pittsburgh, for black, and 3.50c. to 3.60c., Pittsburgh, for galvanized, which is an advance from present prices on black and galvanized of \$2 a ton.

Warehouse Business.—Orders for delivery from stock are small and August is not expected to be as good a month as July. With mills in a stronger position, jobbers expect improvement in September.

Imports.—In the week ended Aug. 25, 400 tons of pig iron arrived from Sweden. Ore imports were 7600 tons of iron ore from Algeria and 298 tons from Spain and 2000 tons of manganese ore and 1500 tons of chrome ore from India. Steel arrivals consisted of 635 tons of structural shapes and 67 tons of steel bars from Belgium, 611 tons of skelp and 94 tons of steel plates from France, 228 tons of bars from Sweden, 28 tons of skelp and 4 tons of steel scrap from the United Kingdom and 54 tons of steel ingots from Germany.

Old Material.—Consumer buying of iron and steel scrap has not yet been heavy in eastern Pennsylvania, but the market is beginning to develop a strong upward movement, reflecting the strength of the Pittsburgh district, and dealers are covering on old contracts at continually advancing prices. Bundled sheets and cast borings have been bought at \$11 per ton, delivered Harrisburg, Pa., and shafting at \$17.50 per ton, delivered. Stove plate is quotable at \$11.50 to \$12 per ton, a Harrisburg consumer having offered \$12 per ton, delivered, and obtained only a small tonnage at this price. No. 1 heavy melting steel is unchanged at \$13 per ton and most of the eastern Pennsylvania consumers are apparently well covered for the present.

Prices per gross ton delivered consumers' yards, Philadelphia district:

No. 1 heavy melting steel.	\$13.00
Scrap T rails	12.50
No. 2 heavy melting steel.	\$11.00 to 11.50
No. 1 railroad wrought.	13.50 to 14.50
Bundled sheets (for steel works)	10.50 to 11.00
Machine shop turnings (for steel works)	10.50
Heavy axle turnings (or equiv.)	12.00 to 13.00
Cast borings (for steel works and roll. mill)	10.50 to 11.00
Heavy breakable cast (for steel works)	15.00 to 15.50
Railroad grate bars.	11.50 to 12.00
Stove plate (for steel works)	11.50 to 12.00
No. 1 low phos., hvy., 0.04% and under.	17.50 to 18.00
Couplers and knuckles.	14.50 to 15.00
Rolled steel wheels	14.50 to 15.00
No. 1 blast f'nace scrap.	9.50 to 10.00
Wrot. iron and soft steel pipes and tubes (new specific)	13.00
Shafting	17.00 to 17.50
Steel axles	19.00 to 20.00
No. 1 forge fire.	11.00 to 11.50

New York

Large Plate Orders Taken by Eastern Mills— Pig Iron Prices Higher

NEW YORK, Aug. 28.—With continued good demand, pig iron prices are gaining in strength. Buffalo foundry iron has been advanced to a minimum of \$16.50, base furnace, and one producer is asking \$17, while a third has raised its quotation to \$17.50. The trend is indicated by the fact that some orders have been booked at \$17, base Buffalo. Prices of other domestic irons are also stiffening. Sales in this district during the week totaled 17,000 tons. The General Electric Co. closed for about 5000 tons for various plants and there were several large New England sales, but in this territory bookings were predominantly in small lots. For one selling house, which disposed of over 4000 tons, the largest individual order was 400 tons. Although a good share of current business calls for prompt shipment, an increasing number of smaller foundries are asking for fourth quarter contracts. In addition, there are several large new inquiries for foundry iron for the last quarter—one for 6000 tons, a second for 2500 tons and a third for 2000 tons. The New York Air Brake Co. has closed against its inquiry for 200 tons of low phosphorus for Watertown, N. Y. It is becoming increasingly difficult to purchase iron for water delivery. Some furnaces are from 10 days to a month behind on barge shipments. The scarcity of barges resulting from the heavy wheat movement is still acute.

Prices per gross ton, delivered New York district:

Buffalo No. 2 fdy., sil. 1.75 to 2.25	\$21.41 to \$21.91
*Buf. No. 2, del'd east. N. J.	19.78 to 20.28
No. 2, del'd east. N. J. tidewater	19.01 to 19.51
East Pa. No. 2 fdy., sil. 1.75 to 2.25	20.39 to 21.52
East Pa. No. 2X fdy., sil. 2.25 to 2.75	20.89 to 22.02
East Pa. No. 1X fdy., sil. 2.75 to 3.25	21.39 to 22.52

Freight rates: \$4.91 from Buffalo, \$1.39 to \$2.52 from eastern Pennsylvania.

*Price delivered to New Jersey cities having rate of \$3.28 a ton from Buffalo.

Plates, Shapes and Bars.—Eastern mills have booked a large tonnage of plates in the past week or 10 days. The Chesapeake & Ohio Railroad has ordered 9000 tons of plates from one mill, while another mill has booked an order from a Virginia structural fabricator for 6000 tons. The Standard Oil Co. of New Jersey has bought about 1000 tons, of which 400 tons was wide, still-bottom steel for tanks. The Todd shipyard is in the market for 250 tons of plates. Most of the large business placed went at less than prevailing market prices. About 2000 tons or more of plates will be needed by the American Locomotive Co. for 55 locomotives ordered by the New York Central. August specifications against contracts for plates, shapes and bars have been heavier than those of July. Next week most

of the mills will impress upon contract customers the necessity of getting in the balance of third quarter specifications by Sept. 10. Some mills are informing their customers that all tonnage not specified by that date will

be cancelled. Instructions have been given to sales offices of nearly all steel companies that fourth quarter contracts will contain a clause providing for complete specifications by Dec. 10. One or two companies have definitely announced a \$2 advance on fourth quarter contracts, but in a majority of cases no announcements whatever have been made. Buyers have shown little interest in their requirements for that period.

Mill prices per lb., deliv'd New York: Soft steel bars, 2.19c. to 2.24c.; plates, 2.12½c. to 2.22½c.; struct. shapes, 2.14½c. to 2.19½c.; bar iron, 2.14c.

Wire Products.—Some of the leading makers of wire products have announced that present prices will be continued for the fourth quarter. One large producer will open its books on Sept. 1 for contracting.

Strip Steel.—Local sales offices of companies making cold-rolled strip steel have received announcements of a change in quoting prices, wherein the base price will apply on more than 3 tons, with extras for small lots. The price announced is 2.85c., Pittsburgh or Cleveland.

Sheets.—Orders and specifications for sheets are in increasing volume. Some consumers who did not contract for this quarter are taking advantage of the opportunity to make contracts at present prices on which specifications will be accepted until Sept. 10. Some mills have definitely turned down requests for October shipment against third quarter specifications. It is likely that considerable tonnage will be carried over to that month, but shipment will be at mill convenience rather than at buyer's dictation. Tonnage specified for shipment in September, but which in some cases may not leave the mills until after Oct. 1, will take the 2 per cent discount for cash in 10 days, but otherwise the new discount of one-half of 1 per cent will apply.

Reinforcing Bars.—Joseph T. Ryerson & Son, Inc., will furnish 700 tons of bars for two plant buildings for the Western Electric Co., Inc., at Kearny, N. J., and the Jones & Laughlin Steel Corporation is expected to supply a similar tonnage for foundation work on the Western Union Building in New York. Excepting these two jobs, the week's awards have been light, but there is enough pending work to assure considerable activity during September. Prices are unchanged.

Warehouse Business.—Possibly as a reflection of the better position of mills, jobbers are beginning to receive slightly larger orders and inquiries, principally for sheets and structural material. The past week has been considerably better than the earlier weeks of the month and quotations on all products are apparently quite firm.

Cast Iron Pipe.—Southern makers continue to quote on a basis of \$34 to \$35 per ton, Birmingham, which is too high to compete with foundries in the North. Northern producers are endeavoring to maintain the market at about \$37.60 per net ton, de-

livered, New York, but sales have been made down to \$35.60 per net ton, delivered. Buying is in most cases limited to small lots, orders for car-load lots and less being rather numerous. The Department of Water Supply, Gas and Electricity, New York, opens contractors' bids Aug. 31 and Sept. 6, on several hundred tons of water pipe for the boroughs of Queens and the Bronx. The lowest bid for a contract to lay 525 tons of water pipe at Amagansett, N. Y., was submitted by the W. G. Fritz Co., West Orange, N. J., and it is reported that centrifugally cast pipe will be used.

Prices per net ton, deliv'd New York:
Water pipe 6-in. and larger, \$35.60 to \$37.60; 4-in. and 5-in., \$40.60 to \$42.60; 3-in., \$50.60 to \$52.60; Class A and gas pipe, \$4 to \$5 extra.

Coke.—Quotations on all grades are stronger and on by-product foundry coke producers are well sold ahead. A rapid increase in demand for furnace grade is reported for melters in this district, with a local by-product operation quoting \$7.75 per ton alongside consumer's dock and a northern New York producer \$6.50 alongside dock. Connellsville furnace coke continues at \$2.75 to \$3 per ton, Connellsville, and standard foundry is about \$3.75 per ton, Connellsville. Special brands of foundry coke are \$4.85 per net ton, ovens, and delivered prices are \$8.56 per net ton, to northern New Jersey, Jersey City and Newark and \$9.44 to New York and Brooklyn. By-product foundry coke prices are unchanged at \$9 to \$9.40, Newark or Jersey City, and \$10.06, New York or Brooklyn.

Old Material.—With brokers endeavoring to cover themselves on old

contracts in a rapidly rising market, buying prices are in many cases not representative of the latest purchase prices of consumers. Dealers are buying No. 1 heavy melting steel at \$13 per ton and more, delivered to eastern Pennsylvania on \$13 orders, and brokers with contracts at Weirton, West Va., and Butler, Pa., have paid as high as \$10.75 per ton, New York, to which is added a freight rate of \$5.30 per ton to destination. Specification pipe is quoted at \$13 per ton and higher, delivered eastern Pennsylvania, and stove plate is reported to be difficult to obtain at \$12 per ton, delivered, which is the highest price that has been paid by a consumer. Eastern Pennsylvania consumers are pressing for deliveries on their contracts, but apparently are not yet in need of additional tonnage.

Dealers' buying prices per gross ton, f.o.b. New York:

No. 1 heavy melting steel	\$10.35 to \$10.75
Heavy melting steel (yard)	7.25 to 7.75
No. 1 hvy. breakable cast	11.25 to 12.00
Stove plate (steel works)	7.75 to 8.25
Locomotive grate bars	7.75 to 8.25
Machine shop turnings	6.25 to 6.50
Short shoveling turnings	6.25 to 6.50
Cast borings (blast furn. or steel works)	6.00 to 6.50
Mixed borings and turnings	6.00 to 6.50
Steel car axles	16.00 to 16.50
Iron car axles	23.50 to 24.00
Iron and steel pipe (1 in. dia., not under 2 ft. long)	9.25
Forge fire	6.50 to 6.75
No. 1 railroad wrought	10.00 to 10.50
No. 1 yard wrot., long	7.50 to 8.00
Rails for rolling	10.50 to 11.00
Cast iron car wheels	12.00 to 12.50
Stove plate (foundry)	8.75 to 9.00
Malleable cast (railroad)	10.00
Cast borings (chemical)	10.75 to 11.25

Prices per gross ton, deliv'd local foundries:

No. 1 machy. cast	\$15.50 to \$16.00
No. 1 hvy. cast (columns, bldg. materials, etc.)	13.50 to 14.00
cupola size	13.50 to 14.00
No. 2 cast (radiators, cast boilers, etc.)	13.00 to 13.50

prices still show an upward tendency, advances by several furnaces being reported. Sales by Cleveland interests totaled 73,000 tons during the week, or 10,000 tons more than in the previous week. This business was all in foundry and malleable iron for the remainder of the year and was well distributed among the territories served by local sellers. Consumers' stocks are reported low and shipments from several furnaces this month will sharply exceed production. Cleveland furnaces are practically sold up for the remainder of the year. Local prices on foundry and malleable iron are unchanged but another 50c. a ton advance for out of town shipment is probable. Out of town sales during the week were at the recently advanced price of \$17. Another Lake furnace interest, which for a week had been quoting a price range of \$17 to \$17.50, has established a flat \$17.50 price. One Valley producer has marked up its price to \$17, and, with higher Valley prices, the Cleveland price for local delivery, which has not been changed recently, is likely to be advanced. In Buffalo, a 50c. a ton advance to \$17 has been made for New England delivery. In Michigan, the market is unchanged at \$18. A leading producer has advanced Southern foundry iron 50c. a ton to \$16, Birmingham. Sales during the week were largely confined to small lots, one of the largest being 6000 tons placed by the Standard Sanitary Mfg. Co., with a Valley furnace. One of the Toledo furnaces of Pickands, Mather & Co. was blown out during the week.

Prices per gross ton at Cleveland:

N'th'n fdy., sil.	1.75 to 2.25	\$18.00
S'th'n fdy., sil.	1.75 to 2.25	22.00
Malleable		18.00
Ohio silvery, 8 per cent.		28.00
Basic Valley furnace	\$16.00 to	16.50
Stand. low phos., V'ley furn.		26.50

Prices, except on basic and low phosphorus, are delivered Cleveland. Freight rates: 50c. from local furnaces; \$3 from Jackson, Ohio; \$6 from Birmingham.

Sheets.—There is a good demand for auto body sheets in this territory, but other grades are rather slow. Specifications from the automotive industry in the Detroit territory continue fairly heavy and most mills have enough orders to keep them operating at present schedules from two to four weeks. Nearly all mills have adopted the new advance in prices for the fourth quarter, but consumers are as yet showing no interest in that delivery. Prices for current orders are no higher than they have been. Black sheets are being quoted

Cleveland

August Steel Shipments at a High Rate—Alloy Steel Bars and Cold-Rolled Strip Advanced—Pig Iron Active

CLEVELAND, Aug. 28.—With mill orders holding up to recent heavy volume, August will show an exceedingly good record in the volume of finished steel business. Demand for steel bars is heavy, which is attributed in a large measure to specifications from the automotive industry. Forge shops and other automobile parts manufacturers continue at near-capacity production. Structural shapes are moving well to manufacturing industries. Plates are only moderately active. With the continued good volume of business, there is quite a little slowing up of mill deliveries. There is not much new business in bars, plates and structural shapes, as most consumers are under contract. Buyers generally are taking out all the material they have contracted for and it is not expected that there will be much third quarter tonnage left unspecified on Sept. 10 when specifications must all be in against third quarter contracts. Fourth quarter contracts will require all specifications to be in by Dec. 10.

While steel bars and structural material are generally quoted at 1.90c., Pittsburgh, 1.85c. has not entirely disappeared. On plates, 1.85c. is still rather general, although mills are having less trouble than recently in getting 1.90c. The local mill bar price ranges from 1.85c. to 1.90c., Cleveland.

Alloy steel bars have been advanced \$2 a ton for the remainder of the year. Hot-rolled strip appears to be definitely established at third quarter prices for round-lot buyers for the next quarter, although the recently

announced advances will apply to small-lot consumers. Fourth quarter prices on cold-rolled strip are not yet definitely determined. While one producer has announced an advance, several have not yet named their prices for that delivery.

Pig Iron continues very active, with advancing prices. However, it is believed that prices will have to go still higher to induce idle merchant furnaces to go into blast.

Pig Iron.—The market continued very active in the past week and

Warehouse Prices, f.o.b. Cleveland

	Base per Lb.
Plates and struct. shapes	3.00c.
Soft steel bars	3.00c.
Reinforc. steel bars	2.25c.
Cold-fin. rounds and hex.	3.65c.
Cold-fin. flats and sq.	4.15c.
Hoops and bands	3.65c.
Cold-finished strip	*5.95c.
Black sheets (No. 24)	3.40c.
Galvanized sheets (No. 24)	4.25c.
Blue ann'l'd sheets (No. 10)	3.25c.
No. 9 ann'l'd wire, per 100 lb.	\$2.85
No. 9 gal. wire, per 100 lb.	3.30
Com. wire nails, base per keg	2.85

*Net base, including boxing and cutting to length.

at 2.65c. and galvanized at 3.40c., Pittsburgh and Valley; blue annealed at 1.90c., Pittsburgh, and 2c., Valley.

Semi-Finished Steel.—One producer has reestablished for the fourth quarter the present wire rod price of \$42, Cleveland. Sheet bars, large billets and slabs will probably be established at \$33, Cleveland, for the last quarter. Specifications against contracts continue heavy and deliveries are a little slow.

Cold-Rolled Strip.—One producer has announced a 2.85c., Cleveland, base price for the fourth quarter for 3 tons and over. Others have not yet named prices for that delivery, but will make efforts to get the market on a higher basis. If the advance holds, fender stock will probably be marked up \$3 a ton to 4.25c. Current orders for cold-rolled strip are still being taken at 2.65c., but the demand is not very active. The plan of applying the base price to 1 to 3 tons, with a 25c. per 100 lb. reduction for larger lots, never became generally effective in this territory and has been abandoned.

Wire Products.—A leading independent producer has announced for the fourth quarter the present prices to jobbers of 2.40c. Pittsburgh and Cleveland, for plain wire and \$2.55 per keg for nails. Current prices are firmer than in some time.

Reinforcing Bars.—An award of 450 tons for Cleveland Union Terminal work was the only one of size during the week. Rail steel bars are somewhat firmer, although 1.75c., mill, is still being quoted.

Warehouse Business.—August sales show a fair gain over those of July. Jobbers report a better volume of business, particularly in steel bars and plates, from makers of automobile parts and crane and shovel manufacturers. Deliveries by mills have slowed up somewhat, which has caused consumers to rely more on warehouses for material wanted quickly. Demand from the building field is slow.

Hot-Rolled Strip.—The third quarter prices generally will remain in force through the last quarter, as some of the leading producers have informed their regular trade that they will carry them through the quarter at the prices that prevailed during both the second and present quarters. These large consumers are getting strip at a net price that figured back is about an average 1.75c. base price for wide material and higher for narrow strip. Efforts have been made recently to get prices on a higher level or to 1.90c., Pittsburgh, for strip 6 to 12-in. wide, 2c. for 3 to 6-in. wide and 2.20c. for strip under 3-in. wide. However, these prices evidently will apply during the fourth quarter only to small-lot buyers. Some of the producers are working on new cards of extras for hot-rolled strip, which will simplify the present price structure by the elimination of the present classification of material into three price ranges and by the adoption of one base price for all gages and widths. It is planned to issue new list of ex-

tras shortly and to place them in effect with a new base price of possibly 1.90c. on Oct. 1.

Alloy Steel.—A price advance of \$2 a ton on alloy steel bars was announced Aug. 25 to apply to fourth quarter contracts and to all new current business. The advance was made by changing the base from 2.65c. to 2.75c. As consumers generally are covered for this quarter, the advance will have little effect before October. Specifications continue to come out in satisfactory volume.

Iron Ore.—Ore firms are making quite a few small-lot sales of Lake Superior ore for filling in consumers' requirements. Shipments continue in heavy volume.

Coke.—A price advance of 50c. a ton for by-product domestic coke has been made by Detroit producers effective Sept. 1 and an Ohio maker has made a similar advance for Michigan delivery, but is still quoting \$4.50, ovens, for Cleveland delivery. In Detroit, both egg and nut coke are quoted at \$6.50, delivered. Cleveland prices for local delivery are \$5.50, ovens, for egg and \$5 for nut. Foundry coke is dull and unchanged at \$3.50 to \$4.85, ovens, for Connellsville brands and \$7.75, Painesville, for by-product coke.

Bolts, Nuts and Rivets.—Specifications are holding up to recent fair volume and prices are unchanged. There is not much new business.

Old Material.—Dealers have forced prices up 25c. a ton more on No. 1 heavy melting steel and blast furnace scrap and other dealers who are short on scrap have been compelled to pay the advances to fill existing mill orders. Dealers are paying \$14.25 for No. 1 heavy melting steel for shipment to local mills exacting in their specifications and as high as \$10.25 has been offered for blast furnace scrap. There has been no buying by mills since the advance. Some of the scrap lists of Michigan automobile companies for September have been issued and show a sharp decline in offerings compared with the present month. The Dodge list totals 2000 tons and the Chrysler list 2500 tons.

Prices per gross ton delivered consumers' yards:

Railroad Equipment

New York Central Buys 55 Locomotives

PURCHASE of 55 locomotives by the New York Central was the outstanding transaction of the equipment market in the last week. Locomotive inquiries include 10 switching engines for the Belt Railway of Chicago. The North American Car Co. has placed 100 steel underframes.

Class I railroads in the first seven months this year installed 35,854 freight cars, according to reports filed with the Car Service Division of the American Railway Association. Compared with the corresponding period last year, this was a decrease of 9289 in the number of freight cars installed and a decrease of 30,404 compared with the corresponding period in 1926. Freight cars on order on Aug. 1 this year totaled 14,830 compared with 19,344 on the same date last year and 29,102 on Aug. 1, 1926. In July, the railroads installed 6137 freight cars compared with 7102 in July, 1927.

Locomotives placed in service by the Class I railroads during the first seven months in 1928 totaled 881, a decrease of 314 compared with the corresponding period last year and of 407, compared with the corresponding period in 1926. Locomotives on order on Aug. 1, 1928, totaled 73 compared with 209 on the same date in 1927 and 517 on the same date in 1926. Locomotives installed in July numbered 116 compared with 155 placed in service in July, 1927.

Details of the week's business follow:

Illinois Terminal Co. contemplates entering the market for 100 box cars. This road inquired recently for 100 to 200 gondola cars.

New York Central has ordered 30 Hudson type passenger locomotives, 25 heavy freight locomotives and five additional tenders from American Locomotive Co.

National Railways of Mexico have ordered six mallet type locomotives from American Locomotive Co.

Algoma Central is inquiring for two 2-10-2 type locomotives.

Erie Railroad has ordered one 300-hp. oil-electric locomotive to be built jointly by Ingersoll-Rand Co., General Electric Co. and American Locomotive Co.

Bangor Aroostook is inquiring for two combination baggage and mail cars.

North American Car Co. has ordered 100 steel underframes from Fressed Steel Car Co.

Wabash Railway has ordered 10 hopper cars from American Car & Foundry Co.

Anglo-Mexican Petroleum Co., Ltd., has made inquiry for eight 7000-gal. tank cars.

South Porto Rico Sugar Co. has ordered 10 cane cars and 20 flat cars of 20 tons' capacity from Magor Car Corporation.

Barrett Co. has ordered 15 50,000-lb. tank cars from General American Tank Car Corporation and 15 from American Car & Foundry Co.

International Railways of Central America has ordered 25 20-ton banana cars from Magor Car Corporation.

Belt Railway of Chicago will buy 10 switching engines.

Pacific Coast

Projected Pipe Line to Call for 25,000 Tons of Steel—Plate Prices Weaken—Foundry Melt Gains

SAN FRANCISCO, Aug. 25.—(By Air Mail).—Iron and steel bookings on the Pacific Coast during the past week, while not especially heavy, continued to show signs of improvement, and a few large projects were placed. Outstanding among these were 1400 tons of structural shapes for Pier No. 45 at San Francisco, booked by the Pacific Coast Steel Co.; 1160 tons for an office building in Oakland, placed with the Judson-Pacific Co., and 1508 tons of cast iron pipe for the Weyerhaeuser Timber Co., Longview, Wash., awarded to the American Cast Iron Pipe Co.

Building operations in Los Angeles during the first 15 days of the month showed an increase over the corresponding portion of July, but were considerably below the total for the first 15 days of August, 1927. The figures are as follows: August, 1928, \$4,200,914; July, 1928, \$2,347,618; August, 1927, \$6,975,679.

Pig Iron.—Although foundry operations in the San Francisco district have shown little improvement of late, reports from melters in the southern part of the State indicate a substantial betterment, due, no doubt, to the revival of activity in the oil fields in that section, especially in the Santa Fe Hills district. A shipment of 800 tons of Indian iron arrived in port today, 400 tons of which will be unloaded later at Los Angeles. Prices of Indian iron now range from \$24 to \$25 a ton, duty paid, f.o.b. cars San Francisco.

Prices per gross ton at San Francisco:
 *Utah basic \$25.00 to \$26.00
 *Utah fdy., sil. 2.75 to 3.25 25.00 to 26.00
 **Indian fdy., sil. 2.75 to 3.25 24.00 to 25.00

*Delivered San Francisco.
 **Duty paid, f.o.b. cars San Francisco.

Bars.—The majority of both sales and inquiries for reinforcing steel bars involve relatively small lots, ranging from 20 to 60 tons. One of the largest inquiries that has come up for figures in this district this year calls for 525 tons for the Bernal Cut project in San Francisco, bids on which open Sept. 17. Out-of-stock prices have shown little signs of strengthening, and 1.85c. to 2c. continues to be the range.

Plates.—Interest in the plate market continues to center around the 7200 tons for distributing mains for the

East Bay Municipal Utility District, Oakland, bids on which were opened last week. As alternate bids were taken on several different types of pipe, including cast iron and concrete steel-lined pipe, the district's engineers have not yet arrived at any decision. The Birchfield Boiler Co. was low bidder on 330 tons for a 32-in. pipe line at Tacoma. The Oregon-Washington Railroad & Navigation Co., Portland, Ore., will open bids Sept. 4 on 150 tons of plates. Plate prices now range from 2.20c. to 2.30c., Pacific ports, the latter figure applying only to small lots.

Shapes.—Structural steel shapes continue actively in demand, and awards this week were the heaviest in over two months. In addition to the two projects mentioned above, the Moore Drydock Co. took 250 tons for Hangar No. 4 at Oakland, Cal., for the Port Commission. Included among new inquiries pending are 700 tons for a factory addition at Tacoma, Wash. Fabricated and erected prices in the section are around \$80 a ton. Prices on plain material remain firm at 2.35c., c.i.f. Pacific ports.

Cast Iron Pipe.—Demand for cast iron pipe has improved. Awards this week exceeded 2500 tons and were the heaviest in over two months. T. Jakaboni secured the general contract for 469 tons of 6 to 30-in. Class C pipe for the improvement of Forty-second Avenue, South, Seattle, Wash., and Fiorito Brothers took the general contract for 188 tons of 4 to 8-in. Classes B and C pipe for the improvement of Thirty-fourth Avenue, N. W., Seattle. Santa Cruz, Cal., placed 115 tons of 8-in. Class B, the Grinnell Co. taking 91 tons and the American Cast Iron Pipe Co., 24 tons. The Pacific States Cast Iron Pipe Co. was awarded 318 tons of 2-in. Class B pipe for Los Angeles. The largest order of the week was booked by the American Cast Iron Pipe Co. and called for 1508 tons of 4 to 12-in. Class C pipe for the Weyerhaeuser Timber Co. at Longview, Wash. El Monte, Cal., will open bids Sept. 4 for 133 tons of 4 and 6-in. Class B pipe. The United States Cast Iron Pipe & Foundry Co. was low bidder on 1210 tons of 32-in. pipe for East Eleventh Street and Taylor Street, Tacoma, Wash., but alternate bids were also taken on welded steel pipe, the price on the latter being considerably below that for cast iron. San Bernardino, Cal., will open bids Aug. 28 for 258 tons of 20 and 30-in. centrifugal pipe, and San Diego, Cal., will take bids Sept. 10 for the improvement of Mountain View Drive, calling for 178 tons of 4 to 10-in. Class B. The Spring Valley Water Co., San Francisco, has taken bids on 1062 tons of 6 and 8-in. Class 150 pipe.

Standard Pipe.—Demand for oil

country goods continues to increase, well casing being principally in demand. The Pacific Gas & Electric Co., the Pacific Lighting Co. and the Southern California Edison Co. are considering the building of a pipe line to transport natural gas from the Ventura Avenue and Buttonwillow Ridge fields in the southern part of the State to the San Francisco district. The cost of this line is estimated at \$20,000,000 and will require from 25,000 to 50,000 tons or more of 12 to 20-in. line pipe.

Coke.—A shipment of approximately 5000 gross tons of English by-product and beehive coke is scheduled to arrive in San Francisco Sept. 20. Most of this material will be unloaded at San Francisco, the remainder to be delivered to Portland and Seattle foundries. Prices on English coke remain unchanged, and beehive coke is quoted at \$16 a net ton, delivered incoming dock, while by-product ranges from \$11.50 to \$13 a net ton.

Sheets.—An eastern Ohio sheet mill recently sold a large tonnage of black and galvanized sheets to a Seattle jobber, and upon arrival they will be put in storage in Seattle and Portland, as well as in Tacoma, where the buyer is now building a warehouse. Reports of an advance of \$2 per ton in prices by Eastern mills have not as yet been reflected in Seattle market, which, if anything, is lower than for some time. Current prices, f.o.b. Seattle, on sheets in carload lots are: 4.10c. per lb. for No. 24 galvanized, 3.30c. to 3.35c. for No. 24 black, and 2.60c. to 2.62½c. for No. 10 blue annealed.

Otis Steel Co. Adds Another Open-Hearth Furnace

The Otis Steel Co., Cleveland, will immediately begin the erection of an additional 125-ton open-hearth furnace. The contract for furnishing and fabricating the steel for the furnace has been awarded to the Wellman-Seaver-Morgan Co., Cleveland, for delivery in 14 days. This will be the second open-hearth furnace to be built by the Otis company this year. On its completion the company will have seven furnaces.

Furnace Company May Liquidate

Stockholders of the Warwick Iron & Steel Co., owner of two furnaces at Pottstown, Pa., have been notified of a meeting early in September, at which disposal of the assets and liquidation of the company will be considered.

Pittsburgh Engineers to Discuss Welding

An all day discussion of welding, under the auspices of the Engineers Society of Western Pennsylvania, will be held at the William Penn Hotel, Pittsburgh, Friday, Nov. 2.

St. Louis

Granite City Pig Iron Up 50c a Ton—6000 Tons of Rails Placed—Scrap Stronger

ST. LOUIS, Aug. 28.—Sales of pig iron in this market were heavier during the past week than for some time, the Granite City maker selling about 10,000 tons and a leading Southern producer about 3000 tons. The Granite City maker advanced its price 50c. a ton to \$19 to \$19.50, f.o.b. furnace, on Friday, following the heavy bookings. Southern furnaces have raised prices 75c. a ton to \$16.25, Birmingham, for No. 2 foundry iron. The melt of stove foundries, as well as jobbing and implement foundries, is increasing, and generally there is a stronger feeling regarding the future. The shipments of the local maker have been unusually large so far this month. The largest sale of Southern iron during the week was a 500-ton lot. Outstanding sales by the Granite City maker include 2300 tons to an Illinois specialty manufacturer, 750 tons to a Davenport, Iowa, railroad specialty maker; 1200 tons to an Illinois specialty maker; 800 tons to an Illinois equipment builder; 600 tons to a Rock Island melter; 400 tons to a stove manufacturer and 250 tons to a Louisville melter.

Prices per gross ton at St. Louis:

No. 2 fdy., sil.	1.75 to 2.25, f.o.b.
Granite City, Ill.	\$19.00 to \$19.50
N'th'n No. 2 fdy., deliv'd St. Louis.	20.16
Southern No. 2 fdy., deliv'd.	20.67
Northern malleable, deliv'd.	20.16
Northern basic, deliv'd.	20.16

Freight rates: 81c. Granite City to St. Louis; \$2.16 from Chicago; \$4.42 from Birmingham.

Rails.—The Missouri-Kansas-Texas Railroad has purchased 6000 tons of 90-lb. rails, 3900 tons from the Colorado Fuel & Iron Co. and 2100 tons from the Bethlehem Steel Co., the latter to be shipped by water. These orders represent the balance of requisitions issued some months ago but curtailed.

Finished Steel.—The volume of incoming orders received by the Granite City Steel Co. continues at a satisfactory rate, especially in sheets and

tin plate. While tank plates continue slow, prices are firm. The price situation in sheets and plates is greatly improved, and many buyers admit that advances are probable for the next quarter. Warehouse business is improved in the St. Louis industrial district, but orders from the oil fields are so small that they more than offset the gains made here. Reinforcing bar awards for the week total 1000 tons, 600 tons placed with the Laclede Steel Co. for an express terminal building for the Terminal Railroad Association of St. Louis and 400 tons let to the Missouri Rolling Mills Corporation for two sewer projects.

Coke.—The market is quiet. Dealers are not showing much interest in domestic grades, and buying of industrial coke is light, although there has been an improvement in the consumption of pig iron.

Old Material.—Further gains were made last week in the old material market, in which price advances were recorded in the preceding week for the first time in several months. However, the advances have been due almost entirely to the activities of dealers, who have been paying higher

prices to get material with which to fill existing contracts. The higher market has not yet affected consumers, who are buying sparingly. Miscellaneous standard-section rails, bundled sheets, rails for rolling and cast iron carwheels are up 50c. a ton, and railroad springs are \$1 higher. Railroad lists include: Chicago, Burlington & Quincy, 4869 tons; Union Pacific, 380 tons; Missouri Pacific, 113 carloads; Nickel Plate, 28 carloads; Mobile & Ohio, 27 carloads, and Chicago, Milwaukee & St. Paul, eight carloads.

Dealers' buying prices, per gross ton, f.o.b. St. Louis district:

Heavy melting steel.....	\$11.00 to \$11.50
No. 1 locomotive tires....	11.75 to 12.00
Heavy shoveling steel.....	11.00 to 11.50
Miscel. stand-sec. rails	
includ'g frogs, sw'ches	
and guards, cut apart..	13.00 to 13.50
Railroad springs	14.00 to 14.50
Bundled sheets	8.25 to 8.75
No. 2 railroad wrought...	11.00 to 11.50
No. 1 busheling.....	9.00 to 9.50
Cast iron borings.....	8.25 to 8.75
Iron rails	13.00 to 13.50
Rails for rolling.....	13.50 to 14.00
Machine shop turnings....	7.00 to 7.50
Steel car axles.....	18.00 to 18.50
Iron car axles.....	25.50 to 25.75
Wrot. iron bars and trans.	18.25 to 18.75

Cast iron carwheels.....	13.00 to 13.50
No. 1 machinery cast.....	13.50 to 14.00
Railroad malleable	11.50 to 12.00
No. 1 railroad cast.....	13.00 to 13.50
Stove plate	11.00 to 11.50
Agricult. malleable	11.50 to 12.00
Relay. rails, 60 lb. and	
under	20.50 to 23.50
Relay. rails, 70 lb. and	
over	26.50 to 29.00

Birmingham

Pig Iron Prices Advanced 75c a Ton—Demand for Finished Steel Sustained

BIRMINGHAM, Aug. 28.—Quotations on No. 2 foundry iron were increased from \$15.50 to \$16.25 on Aug. 24. Furnace books were opened for fourth quarter on that date, and some tonnage has been entered for that period. Several small-lot sales were made last week, but the total volume was not large. There has been a noticeable increase in inquiries in the last few days. The volume of shipments continues good. The Tennessee company changed its furnaces Nos. 1, 2 and 5 at Ensley, Ala., from basic to foundry iron on Aug. 22. The No. 3 Woodward furnace of the Woodward Iron Co. was blown out Aug. 21 for relining. On Aug. 25 the Vanderbilt No. 2 furnace of this company was blown in on foundry iron. No other changes have been made. A total of 17 furnaces are in blast, with 12 on foundry, three on basic, one on recarburizing iron and one on ferromanganese.

Prices per gross ton, f.o.b. Birmingham dist. furnaces:

No. 2 fdy., 1.75 to 2.25 sil.....	\$16.25
No. 1 fdy., 2.25 to 2.75 sil.....	16.75
Basic	16.25

Finished Steel.—Demand shows no signs of diminishing, and sales officials look for an active fourth quarter. Practically all lines show activity

with the exception of steel rails. Sheets are strong, as are plates and shapes. The present mill prices have prevailed for several weeks. Fourth quarter prices are expected to be announced shortly. Structural steel and reinforcing bar tonnages now being booked represent a fair aggregate of small to moderate-sized orders. The Virginia Bridge & Iron Co. will furnish 150 tons for a cotton mill at Albertville, Ala. The Tennessee company reduced the number of active open-hearth furnaces from 11 to six on Aug. 22, when it shut down all open-hearths at Ensley. Six are active at Fairfield, Ala., and the Gulf States Steel Co. is operating three at Alabama City, Ala.

Cast Iron Pipe.—Sales of pressure pipe have been sufficient to sustain plant operations at a rate of 75 per cent of capacity. The market has been supported by small orders only. For the past several weeks August business has been under that of July and also that of August, last year. Private business is holding up well, with sales made largely through quiet negotiations. Shipments approximate the amount of the current make. Quotations have been \$34 to \$35 per net ton, Birmingham, on 6-in. and larger diameters for some time.

Warehouse Prices, f.o.b. St. Louis

	Base per Lb.
Plates and struc. shapes.....	3.25c.
Bars, soft steel or iron.....	3.15c.

Less than 200 lb.....	50
Hot-press. nuts, hex., blank or tapped,	
200 lb. or more.....	60
Less than 200 lb.....	50

Coke.—Activity in the market is confined largely to spot sales. Shipments are fair for the season, and a little coke is moving out to the larger centers of the country. Quotations on both spot and contract foundry coke remain at \$5 per net ton, Birmingham.

Old Material.—Demand has been increasing gradually for the past few weeks, but has not yet developed sufficient strength to affect prices. There

is considerable demand for No. 1 cast at \$14.50.

Prices per gross ton, deliv'd Birmingham dist. consumers' yards:

Heavy melting steel.....	\$8.50 to	\$9.00
Scrap steel rails.....	11.00 to	11.50
Short shoveling turnings..	7.50 to	8.00
Cast iron borings.....		8.00
Stove plate		13.50
Steel axles	19.00 to	20.00
Iron axles	21.00 to	22.00
No. 1 railroad wrought...	10.00 to	10.50
Rails for rolling.....		13.00
No. 1 cast.....		14.50
Tramcar wheels	12.50 to	13.50
Cast iron carwheels.....	12.00 to	13.00
Cast iron borings, chem...	13.50 to	14.00

what over those of the previous week, and inquiries being received indicate that consumers may place large orders both for immediate needs and for future delivery. Shipments against old contracts are heavier, and the general movement of scrap is growing. In the Montreal district, scrap sales for the week were the largest in the past two months. Current demand is mostly for domestic consumption, although shipments to United States buyers continue in good volume. Prices are firmer but unchanged.

Dealers' buying prices:

	Per Gross Ton	
	Toronto	Montreal
Heavy melting steel.....	\$9.00	\$7.00
Rails, scrap	10.00	9.00

Malleable scrap	13.00	

Canada

Demand for Fabricated Structural Steel Is Heavy—Pig Iron Buying on Up-Grade

TORONTO, ONT., Aug. 28.—A more active buying movement features business in the Canadian pig iron markets. Spot sales, however, are most prominent in weekly transactions, and, while some of these run from 50 to 200 tons, a few have recently been closed for as much as 500 to 600 tons for shipment before the end of September. Some contracts for fourth quarter have been closed, but no active buying has developed for that period. Both at Toronto and at Montreal the demand for merchant iron is on the up-grade. The Algoma Steel Corporation, Sault Ste. Marie, Ont., has blown out one of its blast furnaces, leaving two stacks in and reducing the total number of active furnaces in Canada to seven. Two stacks are in at Sydney, N. S.; two at Hamilton, Ont., and one at Port Colborne, Ont. Canadian prices are firm but unchanged.

Prices per gross ton:

Delivered Toronto	
No. 1 fdy., sil. 2.25 to 2.75.	\$23.10 to \$23.60
No. 2 fdy., sil. 1.75 to 2.25.	23.10 to 23.60

Basic	23.50 to 24.00
Imported Iron, Montreal Warehouse	
Summerlee	33.50
Carron	33.00

Structural Steel.—Structural steel fabricators are experiencing one of the best years in history. Building activities in Canada have reached new high levels and the demand for structural steel and reinforcing bars has been correspondingly large for some time past. The Dominion Bridge Co. has closed a contract with the T. Eaton Co., Toronto, for 12,000 tons of steel for a new furniture building. The McGregor & McIntyre Structural Steel, Ltd., Toronto, has received an order for 4000 tons of steel for the Goodyear Tire & Rubber Co.'s plant addition at New Toronto, Ont. In connection with a proposed 17-story extension to the Royal York Hotel at Toronto 7000 tons of steel will be required, and 3500 tons will be purchased for an addition to the plant of Willys-Overland, Ltd., Weston, Ont. Plans for a bridge over the Saskatchewan River for the Canadian Pacific Railway call for several thousand tons

of steel. According to leading structural steel fabricators there is enough business pending in Canada at present to keep plants running at capacity for three or four years.

Old Material.—With the iron and steel industry in general passing out of the summer depression, business in scrap is taking a turn for the better. Sales for the week advanced some-

Boston

Pig Iron Market Is More Active and Prices Firmer—Scrap Has a Stronger Tone

BOSTON, Aug. 28.—Pig iron sales in this territory exceeded 12,000 tons in the past week, the largest amount for any similar period in months. Approximately 90 per cent of the business was taken by Buffalo, New York and Massachusetts furnaces, the Mystic Iron Works taking about two-thirds. During the first 25 days of August the Mystic Iron Works booked more than 25,000 tons. The past week's business included 2000 tons,

silicon 3 to 3.50 and higher, for the Whitin Machine Works, Whitinsville, Mass.; 2000 tons of No. 2X and No. 1X and 300 tons of malleable for the General Fire Extinguisher Co., Providence, R. I.; 1200 tons of No. 2X and No. 1X for a Connecticut melter; 800 tons for the General Electric Co.; 600 tons for Pittsfield, Mass., and 200 tons for Everett, Mass.; 800 tons of No. 2 plain for a Bridgeport, Conn., plant; 500 tons No. 2X for a central Massachusetts machinery manufacturer; and numerous smaller lots, including Indian No. 2X at \$21.50 and \$21.75 a ton, on dock Boston, duty paid. Two Buffalo stacks have again advanced prices 50c. a ton to \$17, f.o.b. furnace, for No. 2 plain, \$17.50 for No. 2X and \$18.50 for No. 1X. Another stack has advanced from \$16 a ton, base furnace, to \$16.50. Low prices have again been made, however, by furnaces east of Buffalo.

Foundry iron prices per gross ton deliv'd to most New England points:

*Buffalo, sil. 1.75 to 2.25..	\$21.41 to \$21.91
*Buffalo, sil. 2.25 to 2.75..	21.91 to 22.41

*Including quantity differentials.

600 tons was Dutch and the rest Indian iron. Consignments of both Indian and Dutch iron are coming forward regularly each fortnight. Imports of ore during the first half of August were 16,084 tons.

Coke.—The New England Coal & Coke Co. and the Providence Gas Co. intimate there will be no change on Sept. 1 in the price of by-product foundry coke, which is \$11 a ton, delivered within a \$3.10 freight rate zone. Indications are these companies will do a larger furnace and domestic coke business in August than in July, the previous high record month of 1928 on shipments. Owing to the necessity of making minor changes in pipe lines, the new ovens in Connecticut in all probability will not be lighted before Oct. 1, instead of Sept. 1, as originally intended. Comparatively little furnace coke made outside is coming into New England.

Cast Iron Pipe.—Municipalities and industrial companies continue to buy pipe freely. Medford, Mass., has purchased 100 tons of 8-in. pipe from R. D. Wood & Co. The Navy Department, Newport, R. I., closed bids Aug. 22 on 200 tons of 6 to 16-in., but has made no award. On Aug. 27, bids were closed on 150 tons of 6 to 12-in. pipe for Camp Devens, Mass. No other open business is reported. Owing to firmer Alabama pig iron prices, pipe foundries are inclined to lift prices on small dimensions, but the market for large pipe is still subject to concessions. The range on 4-in. pipe is \$45.10 to \$46.10 a ton, delivered common Boston freight rate points, and on 6-in. to 12-in., \$41.10 to \$42.10. The usual \$5 differential on class A and gas pipe is asked.

Old Material.—Prices for No. 1 heavy melting steel for Pittsburgh

district shipment are very firm at \$9.50 to \$9.75 a ton, on cars shipping point, with nine out of every 10 sales at \$9.75. Higher prices are being paid for steel turnings, forge flashings and forge scrap for Pittsburgh district delivery. Little scrap is moving to eastern Pennsylvania consuming points, but the market looks firmer. The local market for rails is easier, presumably because of pending offerings. The Maine Central Railroad on Sept. 5 closes bids on 875 tons of No. 1 rails, 1650 tons scrap rails and miscellaneous material. The Boston Elevated Railway Co. on Aug. 29 closes bids on 1000 tons of girder rails and seven cars of miscellaneous material. New England foundries show more interest in machinery cast, but are buying largely from local or nearby yards. Local brokers are securing few orders. Two steamers with steel scrap cleared from Boston last week, one with 3552 tons for Danzig, and the other with 7200 tons for Genoa. Another steamer will load here about the middle of September for Danzig.

Buying prices per gross ton, f.o.b. Boston rate shipping points:

No. 1 heavy melting steel.	\$9.50 to	\$9.75
Scrap T rails	8.00 to	8.50
Scrap girder rails.....	7.50 to	8.00
No. 1 railroad wrought...	8.50 to	9.00
No. 1 yard wrought.....	7.00 to	7.50
Machine shop turnings...	5.50 to	6.00
Cast iron borings (steel works and rolling mill)...	5.50 to	6.00
Bundled skeleton, long...	7.00 to	7.50
Forge flashings	7.75 to	8.25
Blast furnace borings and turnings	5.00 to	5.50
Forge scrap	6.00 to	6.50
Shafting	12.00 to	12.50
Steel car axles	14.00 to	14.50
Wrought pipe 1 in. in diameter (over 2 ft. long)	8.50 to	9.00
Rails for rolling.....	9.50 to	10.00
Cast iron borings, chemical	9.50 to	10.00

Prices per gross ton deliv'd consumers' yards:

Textile cast	\$13.50 to	\$14.00
No. 1 machinery cast.....	15.00 to	15.50
No. 2 machinery cast.....	13.50 to	14.50
Stove plate	10.00 to	10.50
Railroad malleable	15.00 to	15.50

black and 3.60c. for galvanized are in prospect. Alloy steel business is good and production is running ahead of last year. Bolt and nut business also is good and the market is firm. Prices on reinforcing bars have stiffened, with 2.515c. being quoted by one concern on bars delivered from warehouse.

Old Material.—No large sales have been made during the week, but there has been a strong effort by dealers to fill existing contracts. The mill which last week bought at \$15 is still in the market, but No. 1 heavy melting steel of the grade specified is difficult to get and shipments are being made slowly. A large producer whose last purchase of No. 1 heavy melting steel was at \$13.75 states that it will not enter the market as long as No. 1 steel is held at present prices. With 10,000 tons of scrap coming in each week by boat and having a stockpile larger than it was in November of last year, its needs for the present are supplied. Some No. 1 machinery cast has been sold at \$14.75 and some at \$14.50. Stove plate sales have been made at \$14 and railroad malleable at \$14.75. Scrap supplies available for purchase and sale by dealers are light and practically all dealers are sold short and are offering as much as they are receiving. As high as \$12.50 is said to have been paid by some dealers for No. 2 steel.

Prices per gross ton, f.o.b. Buffalo consumers' plants:

Basic Open-Hearth Grades		
No. 1 heavy melting steel.	\$14.00 to	\$15.00
No. 2 heavy melting steel.		12.25
Scrap rails	13.00 to	13.50

Agricultural	15.00 to	15.50

Examination for associate highway bridge engineers, with entrance salary of \$3,200, is announced by the Civil Service Commission, Washington. Applications must be filed with the commission by Sept. 26. Full information may be obtained from the commission, or from the board of examiners at the post office or custom house in any city.

Buffalo

Higher Pig Iron Prices Announced by Furnaces—Steel Mills Operating at Near-Capacity Rate

BUFFALO, Aug. 28.—Buffalo pig iron producers today announced an advance in prices, effective immediately, of 50c. a ton. The new schedule, which, it is said, will be quoted by all Buffalo producers, is \$17.50 for No. 2 plain, \$18 for No. 2 X, \$19 for No. 1 X and \$18 for malleable. The Buffalo furnaces have for some time been quoting on a \$17 base for delivery in the immediate district, but for

shipment to New England and to lower New York State and New Jersey quotations of \$16 and \$16.50, furnace, have been made. Last week, however, prices for outside shipment were increased to a \$17 basis, though some outstanding quotations at the former prices have not been closed.

Prices per gross ton, f.o.b. furnace:

No. 2 fdy., sil. 1.75 to 2.25.	\$17.00 to	\$17.50
No. 2X fdy., sil. 2.25 to 2.75	17.50 to	18.00
No. 1X fdy., sil. 2.75 to 3.25	18.50 to	19.00
Malleable, sil. up to 2.25..	17.50 to	18.00

Detroit

Employment Record Broken for Third Consecutive Week— Automobile Output at High Rate

DETROIT, Aug. 28.—Business in the Detroit area continues its steady advance. All-time records of Detroit employment have been shattered for the third consecutive week, according to the barometer of the Employers' Association, which reflects the status of the combined payrolls of firms constituting about two-thirds of the city's working population. The increase for the past week was 7504. This brings the total to 287,503, which is the highest employment ever recorded for this city. The corresponding figure of a year ago was 206,074, or 81,529 below the present total.

July production for all General Motors Corporation cars showed a recession from the peak previously reported. Consumers' sales for July dropped to 177,728 units from 206,259 in June. The July figure of 1927 was 134,749. Dealers' sales for July were 169,473, compared with 186,160 in June and 136,909 in July of 1927. July daily output averaged 7400 cars against 7900 in June. For the first seven months of the current year consumer sales totaled 1,240,461, compared with 975,230 for the same period a year ago. The parallel figures for dealer sales were 1,252,789 for 1928 and 1,020,386 for 1927.

The Buick Motor Co., Flint, Mich., is arranging to put on night shifts to increase the production schedule to 1300 cars, which will be a new record for the Buick organization. E. T. Strong, president of the company, states that since July 28 more business has been booked by his company than ever before in the same period of time.

During the past three weeks, production of Dodge cars under the new Chrysler management has been increased from 800 to 1000 a day, with a sufficient increase in unfilled orders to guarantee capacity operation throughout the next three months.

It is said that the new Chrysler organization is aiming at an output of 750,000 cars in 1929, and more than a million in 1930. The Chrysler company as a whole is now running from 50,000 to 60,000 cars behind orders.

The Ford Motor Co., Detroit, plans to triple its production of tri-motor aeroplanes. Since last May the production has averaged one a week. This plane is equipped with a Wasp engine, has a wing span of 78 ft., a capacity of 14 passengers and costs \$65,000.

A new record for one day's production was made by the Graham-Paige Motors Corporation, Detroit, Aug. 14, with a total of 516 cars. This company is feeling no seasonal slump as yet.

Sales of Oakland and Pontiac sixes by the Oakland Motor Car Co., Pontiac, Mich., in July amounted to 22,704 units, a gain of 35½ per cent over the figure for July of the pre-

vious year. The records of this company show 184,252 units shipped in the first seven months of the current year, as compared with 112,888 for a like period of 1927. In fact, the total output of 1927 was only 192,966 units. At the end of July the production total was within 9000 units of the entire 1927 production and the 1927 production was an increase of 40 per cent over that for 1926.

For the first seven months of this year the production of the Olds Motor Works, Lansing, Mich., exceeded all previous full year records.

Sales of the Willys-Overland Co., Toledo, Ohio, for the first seven months totaled approximately 225,000 units, compared with a production of

171,743 units in the entire year 1927. It is expected that total 1928 production will be nearly twice that of 1927.

The production schedule for Nash Motors Co., Kenosha, Wis., is approximately 22,000 units for August. The September schedule will probably be 23,000 units. August deliveries on order amount to 32,360 units.

The market on old material has registered several increases during the past week, with the result that dealers are disinclined to sell at present prices. Mills and furnaces have not been able to cover all of their requirements at present prices. The market is decidedly strong.

Dealers' buying prices per gross ton f.o.b. cars, Detroit:

Hvy. melting and shov.	
steel	\$11.50 to \$12.00
Borings and short turnings	7.50 to 8.00

Cincinnati

Heavy Pig Iron Buying Precedes 75c. a Ton Advance by Alabama Producers—Firmer Tone in Scrap

CINCINNATI, Aug. 28.—Alabama pig iron makers have announced an increase of 75c. a ton to \$16.25, base Birmingham, while the one furnace interest in Tennessee has advanced prices 50c. a ton and is now adhering to a minimum of \$16, base Birmingham. As a result of heavy buying immediately preceding the advance, pig iron sales fell only slightly short of 25,000 tons in the past week and were the largest this year. Both Southern and Northern irons are showing greater strength from the standpoint of prices. A leading district furnace has raised its quotations an average of \$1 a ton and is getting the full silicon differentials. Northern Ohio sellers evidently have booked sufficient tonnages recently to relax somewhat the pressure for business in this territory so that the situation, so far as nearby producers are concerned, is the most favorable in months. Purchases of Southern iron have included several sizable orders. A district consumer has taken 1500 tons of Northern foundry iron, and a Michigan melter has contracted for 500 tons of Jackson County silvery. A large percentage of bookings consists of small lots ranging from single carloads up to 300 tons. The only important inquiry before the trade calls for 500 tons of foundry for delivery to a Springfield, Ohio, company.

Prices per gross ton, deliv'd Cincinnati:

So. Ohio fdy., sil. 1.75 to 2.25	\$19.89
So. Ohio malleable.....	\$20.14 to 20.89
Ala. fdy., sil. 1.75 to 2.25 ..	19.94
Ala. fdy., sil. 2.25 to 2.75 ..	20.44
Tenn. fdy., sil. 1.75 to 2.25 ..	19.69
So'th'n Ohio silvery 8 per cent	26.89

Freight rates, \$1.89 from Ironton and Jackson, Ohio; \$3.69 from Birmingham.

Warehouse Business.—Prices are holding well in this territory in ware-

house products, being unchanged except on hoops, which have been reduced from 4.40c. to 4.25c. per lb. Steel and iron bars are still holding well at 3.30c.; reinforcing bars are in fair demand at 3.15c. Structural shapes and plates are quiet. Sheets are in good demand.

Coke.—Shipments of by-product foundry coke this month have been from 10 to 15 per cent greater than in July, but demand for domestic grades has lagged. By-product egg coke has gone up 50c. a ton at Detroit, the new schedule being \$6.50 per net ton, delivered in Detroit, and \$6, ovens, for outside delivery. Nut size, however, will remain unchanged at \$6, delivered in Detroit, and \$5.50, ovens, for outside shipment. Prices in this district, especially in southern Indiana, are still being somewhat disturbed by low quotations made by a Southern by-product coke maker.

Old Material.—There is a firmer tone to the scrap market traceable almost directly to a better feeling among dealers. District steel plants are accepting moderate tonnages on contracts, while movement of foundry grades remains sluggish. Prices have not changed.

Dealers' buying prices per gross ton, f.o.b. cars, Cincinnati:

Heavy melting steel.....	\$11.00 to \$11.50
Scrap rails for melting....	10.75 to 11.25
Loose sheet clippings.....	8.50 to 9.00
Bundled sheets	9.00 to 9.50

Agricultural malleable ...	10.50 to 11.00

Non-Ferrous Metal Markets

Copper Quiet and Firm, Tin Actively Bought, Lead Prices Advanced, Zinc Unchanged

Copper.—Buying of copper is generally light both for domestic and foreign consumption. Domestic consumers have covered for close to 90 per cent of their September requirements and foreign users can buy on short notice out of stocks. Naturally, under such conditions the market is quiet and not much activity is looked for until after Labor Day. During the past week foreign buying has been normal, but domestic demands have fallen off, with no interest in October metal. Monday and Tuesday domestic business was somewhat more active due to unconfirmed reports of a pos-

sible shortage, but not much credence was given to these. Quotations are firmly unchanged at 14.75c., delivered in the Connecticut valley, at 14.87½c., delivered in the Central West and at 15c. c.i.f. usual European ports, the official quotation of Copper Exporters, Inc. Lake copper is quiet and steady at 14.75c. to 14.87½c., delivered.

Tin.—Sales for the week ended Saturday, Aug. 25, were the largest in some time, totaling approximately 2000 tons. The most active days were Aug. 20 and Aug. 21, when at least 700 tons changed hands on each day, followed by 300 tons on Aug. 22, about 100 tons on Aug. 23 and about 200 tons on Aug. 24. Consumers were very liberal buyers for all positions, with dealers buying only sparingly. Opinion is general that there is still a large quantity to be purchased by consumers for the last quarter. On Mon-

day about 300 tons changed hands, but Tuesday the market was quiet and firm with spot Straits tin quoted at 47.50c., New York. On Monday most of the buying was done by dealers, the first time they have been active in some time. Straits shipments to all countries up to Aug. 25 are reported as about 8200 tons, with the total for the month estimated at over 9000, indicating that supplies are coming liberally. Arrivals thus far this month have been 5605 tons, with 8385 tons reported afloat. Quotations in London Tuesday were lower than a week ago, with spot Standard quoted at £210, future Standard at £206 15s. and spot Straits at £213. The Singapore price was £210 15s.

Lead.—Two advances in the price of lead have been made by the American Smelting & Refining Co. in the last week. On Aug. 23 it raised its

contract price from 6.20c. to 6.30c. and on Monday, Aug. 27, from 6.30 to 6.40c., New York. Buying during the past month has been quite heavy, and the statistical position of the market as to world production and as to stocks has been favorable to the advance. Most consuming lines have been buyers, all quite heavily for September, with some sales for October. The Western market also is active and higher at 6.22½ to 6.25c., St. Louis, for September-October, with some spot metal available at 6.20c., St. Louis.

Zinc.—Demand for prime Western zinc continues normal but is not particularly heavy. The total month's business will average pretty close to that of recent months. Inquiry is not active, but evidently business is being done daily between producers and consumers, which makes the zinc

market somewhat different in character from that of the others, formal inquiries often being dispensed with. Firmness of prices continues a feature, with prime Western available through October at 6.25c., East St. Louis, or 6.60c., New York. Ore prices at Joplin were unchanged Saturday, Aug. 25, at \$40, with production about 12,800 tons. Sales were about 8340 tons and shipments were about 10,600 tons, bringing stocks on Aug. 25 to about 40,900 tons, against 38,700 tons the week before.

Antimony.—With consumer buying light, the market is a little easier and Chinese metal is quoted at 10.25c., New York, duty paid, for all positions.

Nickel.—Wholesale lots of ingot nickel are available at 35c., with shot nickel at 36c. and electrolytic nickel at 37c. per lb.

Aluminum.—Virgin metal, 98 to 99 per cent pure, is quoted at 23.90c. per lb., delivered.

Non-Ferrous Metals at Chicago

CHICAGO, Aug. 28.—Purchases of copper are of moderate size but steady. Demand for zinc and lead is more active, following advances in prices. The old metal market is quiet.

Prices, per lb., in carload lots: Lake copper, 15.25c.; tin, 48.50c.; lead, 6.35c.; zinc, 6.35c.; in less-than-carload lots, antimony, 12c. On old metals we quote copper wire, crucible shapes and copper clips, 10.75c.; copper bottoms, 9.75c.; red brass, 9.50c.; yellow brass, 7.25c.; lead pipe, 4.75c.; zinc, 3.50c.; pewter, No. 1, 30c.; tin foil, 36.25c.; block tin, 45.25c.; aluminum, 12c.; all being dealers' prices for less-than-carload lots.

OBITUARY

JAMES BOWRON, chairman of the board of the Gulf States Steel Co., Birmingham, died suddenly at his home in that city on Aug. 25, of heart disease, aged 84 years. He was born at Stockton-on-Tees, Durham County, England, and, before coming to the United States in 1877, he was engaged in a number of business enter-

prises in that country. Here he became associated with the South Pittsburgh Pipe Works, South Pittsburgh, Tenn., and nine years later became its president. Later he was identified for many years with the Tennessee Coal, Iron & Railroad Co., having left that company to become associated with the Southern Iron & Steel Co. He served as president of this company and later as receiver, prior to its reorganization as the Standard Steel Co. in 1913. In December of that year the company became the Gulf States Steel Co. and Mr. Bowron served as its president until 1921,

JAMES BOWRON

prises in that country. Here he became associated with the South Pittsburgh Pipe Works, South Pittsburgh, Tenn., and nine years later became its president. Later he was identified for many years with the Tennessee Coal, Iron & Railroad Co., having left that company to become associated with the Southern Iron & Steel Co. He served as president of this company and later as receiver, prior to its reorganization as the Standard Steel Co. in 1913. In December of that year the company became the Gulf States Steel Co. and Mr. Bowron served as its president until 1921,

when he retired to the less active duties of chairman of the board.

In the eighteen-nineties, when N. Baxter, Jr., was president of the Tennessee Coal, Iron & Railroad Co., Mr. Bowron was secretary of the company, later treasurer and still later first vice-president and treasurer. In recounting on various public occasions the stressful conditions under which pig iron manufacture was carried on in the South, Mr. Bowron spoke feelingly of the financial anxieties of officers of the Tennessee company. Now and then when checks went out from the company headquarters at Nashville the treasurer took an early train for New York to arrange the financing necessary to meet them. Speaking at the Birmingham meeting of the American Iron and Steel Institute in October, 1914, Mr. Bowron said of those times:

Heavy tonnages of iron were carried in warrant yards on borrowed money. Pig iron brokers made more money than the producers, either out of their sales commissions or by interest on the money which they advanced to the shippers against their bills of lading, sometimes every week and sometimes every day. Abnormal prices were made, which only covered in some places the cash out of pocket cost. The writer can remember one sale of 5000 tons of No. 2 foundry at \$6.25 spot cash, immediate delivery in one block, to meet a pay roll; another commercial transaction, a cargo of No. 4 foundry for Japan at \$5.75, the remainder of the sailing ship being filled up with coke. Needless to say such prices provided nothing for the depreciation of the plants which were standing still, or for the replacement of minerals which were being taken from the richest and most accessible points.

Mr. Bowron's stalwart figure will be recalled by many attendants at foundrymen's conventions in the eighteen-nineties and early nineteenthundreds, and by his fellow members of the American Iron and Steel Institute in more recent years. He took

a pride in referring to his athletic proclivities in his younger days in England, and in his seventies his erect form and ruddy countenance made the common appraisal of his age many years younger.

A. C. RULOFSON, of the A. C. Rulofson Co., San Francisco, Portland and Los Angeles, Pacific Coast representative for the Pittsburgh Steel Co., Illinois Malleable Iron Co., United States Chain & Forge Co. and other companies, died on Aug. 11 at the age of 74,

A. C. RULOFSON

at his home in Oakland, Cal. He was one of the pioneers in the hardware and iron and steel business on the Pacific Coast, his first connection having been with the old firm of Huntington-Hopkins Co., San Francisco. For many years he was connected with Baker & Hamilton and resigned from that company as manager in 1904 to form his own company.

ERNEST J. BOSSERT, proprietor of the Bossert Machine Co., Cincinnati, died at his home in that city on Aug. 27. He was 59 years of age and had been engaged in the manufacture of machinery for 20 years.

PERSONAL

WILLIAM J. TEEMER, for the last 18 years associated with the National Tube Co. both in the operating and sales departments, has been appointed manager of sales of the Delaware Seamless Tube Co., Auburn, Pa., subsidiary of the Allegheny Steel Co.

CHARLES J. ARTHUR, recently sales engineer for the A. R. Amos, Jr., Co., Philadelphia, has been added to the Philadelphia sales organization of the Wagner Electric Corporation, St. Louis. Since his graduation from the University of Pennsylvania in 1923 he has had experience in construction, inside maintenance and operation, with the American Telephone & Telegraph Co.; in transmission, distribution, design and layout, with the Philadelphia Electric Co.; in laboratory research work, with the Western Electric Co., and in industrial sales engineering, with the Amos organization.

W. FRANK ROBERTS, for 10 years general manager of the Sparrows Point, Md., plant of the Bethlehem Steel Co., has resigned. He has been succeeded by **STEWART J. CORT**, who has been identified with the company's Bethlehem, Pa., plant for a number of years.

A. E. HERZBERG, manager of the transformer sales division of the Wagner Electric Corporation, St. Louis, who has been a major in the United States Army Reserve, has been promoted to the grade of lieutenant-colonel.

WILLIAM FAIRFIELD WHITING, president of the Whiting Paper Co., Holyoke, Mass., who has been appointed by President Coolidge to succeed **HERBERT HOOVER** as Secretary of Commerce, has been a prominent figure in New England industrial, railroad and financial organizations for many years. He was born at Holyoke in 1864 and attended Williston Seminary and Amherst College, having been graduated from the latter institution in 1886. He immediately became associated with his father in the paper manufacturing concern, which had been founded in 1865, and has been identified with the business ever since. In accepting the appointment Mr. Whiting stated that he expected to pursue the policies inaugurated by Mr. Hoover.

P. S. MENOUGH has been made assistant to the president of the Duralloy Co., Pittsburgh. He is a graduate of Cornell University, and was for nine years chief engineer of the Eastern Malleable Iron Co., Bridgeport, Conn.

FRANK W. CRAMER has been appointed general electrical superintendent of the Republic Iron & Steel Co., Youngstown. He was formerly as-

sistant superintendent of the electrical department at the Cambria works, Bethlehem Steel Co., Johnstown, Pa., and is a graduate of Pennsylvania State College. He was identified with Pennsylvania power companies before going with the Midvale Steel & Ordnance Co. at Johnstown in 1917. Mr. Cramer is first vice-president of the Association of Iron and Steel Electrical Engineers, in the affairs of which he has been very active.

GEORGE BATTY, recently a consultant on steel foundry practice at Detroit, has been appointed research director of the Steel Castings Development Bureau, 500 Stock Exchange Build-

GEORGE BATTY

ing, Philadelphia, and will be available for consultation at that address on Fridays and Saturdays. The bureau, which is financing an investigation of the manufacture of steel castings with view toward improving the quality of the product, is supported by the following companies: Atlantic Steel Castings Co., Chester, Pa.; Crucible Steel Casting Co., Lansdowne, Pa.; Treadwell Engineering Co., Easton, Pa.; Pennsylvania Electric Steel Castings Co., Hamburg, Pa.; Dodge Steel Co., 6501 Tacony Street, Philadelphia; Riverside Steel Castings Co., Newark, N. J.; Deemer Steel Casting Co., New Castle, Del., and Empire Steel Castings Co., Reading, Pa. Mr. Batty attended the Sheffield Scientific School, which later became a part of Sheffield University, Sheffield, England. For the next 11 years he was engaged in capacities of steel maker or works manager in a number of Sheffield companies manufacturing tool and special steels by the crucible and electric processes. In 1920 he spent five months in Detroit in a consulting capacity with the Ford Motor Co., and upon his return to England, entered upon the production of steel castings. In 1923 he was ap-

pointed works manager of the National Steel Foundry, Ltd., in Scotland and later became technical director of that company. He returned to Detroit to engage in private consulting work in 1927.

H. C. BUSCH, who has been president of the Cisco Machine Tool Co., Cincinnati, since its inception, has retired and has been succeeded as president by **RALPH B. BUSCH**, who has been vice-president. H. C. Busch was also president of the Cincinnati Iron & Steel Co., which was consolidated with Joseph T. Ryerson & Sons, Inc., several years ago, but has been retiring from his active business interests in recent years to devote more time to travel. Ralph B. Busch joined the Cisco organization after leaving Cornell University seven years ago.

A. S. GOULD, for 10 years sales manager of the Oster Mfg. Co., Cleveland, has been elected secretary of the company and will continue in charge of sales. He succeeds **ROGER TEWKSBURY** as secretary, the latter having been elected vice-president and treasurer. R. B. TEWKSBURY continues as president of the company.

LOUIS K. LIGGETT, heretofore chairman of the board of directors of the Winchester Repeating Arms Co., New Haven, Conn., has been made chairman of the executive committee in place of **FRANK G. DREW**, president, who becomes president of the board of directors. **WILLIAM A. TOBLER**, vice-president and general manager, is now president. **LESLIE R. THOMPSON** is vice-president and treasurer.

C. L. WARWICK, secretary-treasurer American Society for Testing Materials, Philadelphia, will visit in October the principal industrial and engineering centers of the Pacific Coast to discuss the development of the society's interests in that territory and to establish closer contacts with Western members. Despite the 3000 miles separating the Pacific Coast from the society's headquarters, that district stands fourth among nine into which the country is divided, in proportion of A. S. T. M. membership to population and to capital invested in manufacturing industries.

WILLIAM B. PRESCOTT, formerly manager of the raw materials department, Youngstown Sheet & Tube Co., has been appointed manager of sales for the Koppers Coal Co.; a subsidiary of the Koppers Co., 379 Union Trust Building, Pittsburgh.

STANLEY GRAND-GIRARD, formerly electrical engineer for the Republic Iron & Steel Co., Youngstown, has been appointed electrical superintendent of the Sharon Steel Hoop Co., Sharon, Pa., succeeding the late John Barker.

W. A. MAXWELL, Jr., who has been production manager of the Colorado Fuel & Iron Co., Denver, since May 1, 1927, has been elected vice-presi-

dent and production manager and will have charge of all manufacturing, mining and related activities of the company. He has also been elected vice-president of the Rocky Mountain Coal & Iron Co., the Colorado Supply Co. and the Colorado Realty Holding Co., subsidiaries of the Fuel & Iron company. Before going with the Colorado company Mr. Maxwell was general superintendent of the Inland Steel Co., Chicago.

THORSTEN Y. OLSEN, vice-president and treasurer Tinius Olsen Testing Machine Co., 500 North Twelfth Street, Philadelphia, will sail from

TINIUS OLSEN

New York for Europe on Sept. 1, to attend the unveiling on Sept. 16, of a statue of his father, TINIUS OLSEN, at the latter's birthplace, Kongsberg, Norway. The cost of the statue has been met by popular subscription in Norway in recognition of Mr. Olsen's philanthropy in the city of his birth, and his assistance to engineering progress in Norway. He has already been tendered many honors and has been knighted by the King of Norway and made a member of the Order of St. Olaf. Tinius Olsen is living, but because of his advanced age, 83 years in September, it was deemed best for him not to make the long journey to his birthplace. Thorsten Y. Olsen, his son, will therefore go as representative of his father and will be accompanied by his wife and brother. They will be abroad about 30 days, and will also visit Sweden and Denmark.

A. E. LEWIS has been appointed vice-president in charge of the Cleveland district of the Great Lakes Chemical Works, Detroit, and will have headquarters at a new office which is being opened at 2509 Terminal Tower Building, Cleveland.

J. M. CURLEY has been appointed Eastern sales representative of the A. Finkl & Sons Co., Chicago, manufacturer of die blocks and drop forge shop accessories, and will maintain headquarters at 292 Main Street, Cam-

bridge, Mass. He succeeds the late W. L. GOODRICH, with whom he was closely associated for many years in the sales of the company's products.

CHARLES BOND, president of the Charles Bond Co., Philadelphia, maker of power transmitting machinery and leather belting, sailed for England on Aug. 11. JOHN R. GRUNDY, vice-president of the company, also sailed for England on Aug. 24 and will probably return in October.

Steel Treating's Western Metal Congress and Exposition

The American Society for Steel Treating will hold a semi-annual meeting in Los Angeles, Jan. 14 to 18, 1929. In connection with this, there will be held the Western Metal Congress and the Western States Metal and Machinery Exposition.

Five days will be devoted to technical sessions on the making, working and treating of metals. The exposition will include displays of machinery, materials and appliances, which will portray the cycle of the metal industry from the raw material to the finished product. In many respects it will not be unlike the society's annual metal exposition to be held in Philadelphia, Oct. 8 to 12.

The meetings and exposition will be held in the Shrine auditorium in Los Angeles. A dozen or more technical societies of the Western part of the country will take part in the program in presenting papers.

New England Industries Meeting Oct. 1 to 3

Materials handling, machine shop practice, management, education and training for industries, aeronautics and applied mechanics are among the topics that will be discussed at the New England Industries meeting, which will be held in Boston, Oct. 1, 2 and 3.

Simultaneous sessions on education and training for the industries, and materials handling, will be held on the afternoon of Oct. 1. Speakers at the training session, according to announcement by the American Society of Mechanical Engineers, include C. K. Tripp, supervisor of apprentices General Electric Co., Lynn, Mass., and W. S. Berry, director of training Scovill Mfg. Co., Waterbury, Conn. D. W. Coe, vice-president and general sales manager of the Canadian Mead-Morrison Co., Ltd., Montreal, Canada, and C. G. Spencer, Baker & Spencer, Inc., New York, will speak on materials handling.

The morning session of Oct. 2 is to be devoted to aeronautics, with papers by Sumner Sewall, traffic manager of the Colonial Air Line, A. Willgoos, chief engineer Pratt & Whitney Air-

L. GERALD FIRTH, general manager Firth-Sterling Steel Co., McKeesport, Pa., sailed last week on a European trip, a month of which will be spent at the Sheffield works of the associated company, Thomas Firth & Sons, Ltd., Sheffield, England.

ROBERT H. IRONS, president Central Iron & Steel Co., Harrisburg, Pa., sailed for Europe last week on the Aquitania and will not return until November.

craft Corporation, and F. W. Mosinger, Norma-Hoffman Bearing Corporation. Papers by A. Dinnick, professor of mechanics, Institute of Mines, Dniepropetrovsk, Soviet Russia, and J. P. DenHartog, Westinghouse Electric & Mfg. Co., East Pittsburgh, Pa., are planned for the applied mechanics session. A second session on applied mechanics will be held Oct. 3, with D. A. Gurney, ordnance department, United States Army, and A. M. Wahl, research department, Westinghouse Electric & Mfg. Co., as speakers.

J. H. George, vice-president Morgan Construction Co., Worcester, and W. J. Fortuno, National Shawmut Bank, Boston, will be among the speakers at the management engineering session.

The machine shop session will feature a symposium on machine shop work for textile mills. There will also be a separate paper on internal grinding by A. M. Drake, chief engineer Greenfield Tap & Die Corporation, Greenfield, Mass. R. J. Cullen and H. S. Walton of the Boston & Albany Railroad, will be speakers at a railroad session.

Varied Program for National Fuels Meeting

Study of fuel characteristics, the industrial applications of fuel, heat transfer, powdered fuel uses, refractories and stokers, marine practice, central station methods and smoke abatement are the principal topics scheduled for discussion at the second national fuels meeting to be held Sept. 17 to 20 at the Hotel Cleveland, Cleveland, under the auspices of the fuels division of the American Society of Mechanical Engineers.

The meeting will be opened by an address by Thomas T. Baker, president Carnegie Institute of Technology, Pittsburgh, on Monday morning, Sept. 17, which will be followed during the remainder of that day and Tuesday by technical sessions of the various divisions. The final day of the meeting will be given over entirely to smoke abatement. Plant inspection trips include visits to the Fairmont pumping station of the Cleveland Water Works, the Avon station of the Cleveland Electric Illuminating Co. and to the three Cleveland plants of the American Steel & Wire Co.

Exports and Imports Both Decline

July Exports, with Loss of Only 3 Per Cent, Were Far Above 1927—Import Reduction Was 27 Per Cent

WASHINGTON, Aug. 27.—Exports of iron and steel products from the United States in July aggregated 253,336 gross tons, a drop of 8716 tons or 3.3 per cent under June, when the total was 262,052 tons. Imports in July, amounting to 47,830 tons, showed a large decline, falling off 17,989 tons or 27.3 per cent from June's total of 65,819 tons. The daily export movement in July averaged 8172 tons, compared with 8735 tons in June. The average daily import movement for July was 1543 tons, against 2194 tons in June.

Exports in July, however, were considerably larger than those for July of last year, when the total was 190,532 tons. For the seven months ended with July, the total was 1,612,078 tons in 1928, against 1,323,959 tons in 1927. Imports in July of last year, amounting to 61,112 tons, were 13,382 tons above the movement of July, 1928. For the seven months ended with July, imports totaled 437,725 tons in 1928, against 444,596

United States Imports of Iron and Steel Products in July

From	Gross Tons
Austria	26
Belgium	10,593
Czechoslovakia	16
Denmark	1
France	10,882
Germany	8,917
Italy	139
Netherlands	2,659
Norway	400
Sweden	1,972
United Kingdom	3,028
Europe	38,632
Canada	6,010
Mexico	64
Other British West Indies	100
America	6,174
British India	2,994
Japan	30
Total	47,830

tons for the corresponding period of last year.

Although the July export movement was less than that of June, decreases were registered in only 18 of the 39

classes into which the trade is divided, 21 having shown gains. The largest gain was made in ingots and semi-finished steel, which increased 10,822 tons to 16,020 tons over the June total of 5198 tons. Galvanized sheets, whose July total of exports was 15,341 tons, showed a gain of 4821 tons over the 10,420 tons exported in June. The decreases were small, with two exceptions. Exports of scrap in July, the largest movement of any of the classes, totaled 43,783 tons, a drop of 21,135 tons from the 64,918 tons exported in June. Plain structural shapes to the amount of 14,509 tons were exported in July, a decline of 4847 tons from the 19,356 tons exported in June.

Exports of scrap in July went principally to Poland, Canada, Italy and Japan, the amounts being in the order named. Next to scrap the largest class exported in July was boiler tubes and welded pipe, with a total of 24,214 tons. Of the 10,189 tons of casing and oil line pipe exported, 2797 tons

				Total	253,336	1,612,078	1,323,959

went to Venezuela, 1640 tons to Colombia, 1008 tons to the Dutch West Indies and 957 tons to Java and Madura. Of the 6603 tons of welded black pipe exported, 2701 tons went to Japan, 803 tons to Venezuela, 687 tons to Canada and 500 tons to Mexico. Galvanized welded pipe exports were 4777 tons, of which 1601 tons went to the Philippine Islands.

Exports of steel plates in July amounted to 14,648 tons, of which 12,160 tons went to Canada, 433 tons to Japan and 125 tons to Cuba. Of the galvanized sheet exports, 2857 tons went to the Philippine Islands, 2728 tons to Canada, 1347 tons to Colombia and 859 tons to Mexico. Japan took 8342 tons of the 19,160 tons of black steel sheets exported, while Canada took 8009 tons and the Philippine Islands, 548 tons. Of the 11,079 tons of steel rails exported, Canada took 2863 tons, Brazil, 2638 tons, the Philippine Islands, 2424 tons, and Cuba, 776 tons. Japan took only 418 tons. Canada was the destination of 7663 tons of 13,899 tons of steel bars exported, while the United Kingdom took 2215 tons. Exports of tin plate, amounting to 21,528 tons, were widely distributed throughout the world. Canada took 5601 tons; Japan, 4807 tons; China, 2930 tons; and Argentina, 1937 tons. Canada was the destination of 12,918 tons of heavy plain structural material.

As usual, Canada was the principal export market for American steel, taking a total of 100,240 tons, while Japan ranked second, taking 28,093 tons.

The drop in imports was reflected in 18 of the 27 classes into which the import trade is divided. It is believed that the decline was due, partially at least, to the rising prices in Europe, making it more difficult to penetrate the American market. There was a reduction of 5744 tons in imports of pig iron in July, which amounted to 6055 tons, against 11,799 tons in June. British India supplied 2994 tons, while 2325 tons came from the Netherlands. Scrap imports were

3688 tons, a drop of 4027 tons from the 7715 tons imported in June. Imports of structural shapes, amounting to 11,192 tons, showed a decline of 3246 tons from the 14,438 tons imported in June. But for the seven months ended with July the total imports of structural shapes were 99,898 tons, an increase of 11,936 tons over the 87,942 tons imported during the corresponding period of 1927.

Of the July imports of structural material, 5432 tons came from Belgium, 3472 tons from Germany and 2166 tons from France. Cast iron pipe, ranking second to structural shapes in July, showed a movement of 7731 tons, of which 5933 tons came from France and 1791 tons from Belgium. Of the 4992 tons of steel bars

imported, 1554 tons came from Belgium, 1522 tons from Germany, 876 tons from France and 686 tons from Sweden. Of the 2891 tons of ferro-manganese imported, 1739 tons came from Canada, 757 tons from the United Kingdom and 279 tons from Norway. Soviet Russia supplied 15,592 tons of the 21,447 tons of manganese ore imported, while 3512 tons came from Brazil and 1799 tons came from India.

France was the source of the largest imports in July, furnishing 10,882 tons. This was the first time in many months that Belgium was exceeded as the principal source of importations. Imports from Belgium amounted to 10,592 tons. Germany was third, with 8917 tons.

Continued Shrinkage in Iron Ore Imports

IMPORTS of iron ore into the United States in July are reported by the Department of Commerce at 183,256 gross tons, compared with 188,892 tons in June and 211,270 tons in May. The July imports are the smallest since March and are 27 per cent lower than the 252,162 tons of July, 1927. Imports in the first seven months of the year have been 1,451,669 tons, a reduction of about 8 per cent from the 1,575,594 tons of last year.

In spite of the reduction in the to-

tal, imports from Chile, which is the leading source of supply, showed a gain of nearly 6 per cent, reaching 817,500 tons. French Africa in second position showed a gain also, as did Canada and Spain. The bulk of the loss was felt by Sweden and was due undoubtedly to the strike at the Swedish mines. The reduction of Swedish imports in the seven months was about 87 per cent. There was a falling off also of about one-quarter in imports from Cuba.

Details of the July shipments and of those of the first seven months, with comparisons for last year, are shown in the table.

SOURCES OF AMERICAN IMPORTS OF IRON ORE (In Gross Tons)

	July		Seven Months Ended July	
	1928	1927	1928	1927
Chile	102,000	104,400	817,500	772,300

German Domestic Business Declines

Exports Increasing—French Mills Well Filled and Seeking More Labor—British Exports Small Except in Pig Iron

(By Cable)

LONDON, ENGLAND, Aug. 27.

THE outlook for Cleveland iron is regarded more favorably, although business generally is still quiet. Buyers in Scotland, however, are reported negotiating for a large tonnage. Prices are firm and recession is considered unlikely as Palmer's Shipbuilding & Iron Co., which is outside the Cleveland makers' association, has closed its Jarrow works and is out of the market.

Hematite demand has improved slightly and prices are tending to higher levels. Foreign ore is quiet, with quotations steady.

Finished iron and steel in heavy sizes is generally dull, especially for export, but domestic users are supplying works with numerous orders for engineering and structural materials. Robert Heath & Lowmoor is closing the Stafford Iron & Steel Co. plant Sept. 8, the company being controlled by a receiver.

Welsh tin plate makers have raised the minimum price to 18s. (\$4.37) per base box f.o.b. works port, largely to combat the efforts of some buyers to obtain lower prices. Consumers' interest is increasing and good business is expected to develop. The report that 1,000,000 boxes of oil can tin plate had been placed with Welsh makers by Eastern consumers lacks confirmation.

Galvanized sheets are quiet in the Indian trade, but other markets are fair buyers of small quantities. Black sheets are inactive.

Continental markets are strong, although buying by traders in this country is light. Continental mills are reported to have booked large orders for direct export and order books are well filled.

Luxemburg production in July was 224,800 tons of pig iron and 207,600 tons of raw steel. The German steel output in July was 1,311,000 tons.

ders because they cannot execute them for sufficiently early delivery.

The domestic pig iron market is strong and demand is good, but export prices are lacking in firmness as a result of continued competition from British producers. In September, the Société des Acieries de France expects to blow in a new blast furnace at its Isbergues works, where a new light-gage sheet mill has been constructed.

Export demand for semi-finished steel is good, and some shortage of supplies is beginning to appear. It is difficult to obtain blooms at less than £4 13s. (\$22.60) per ton, and billets are firm at £4 15s. (\$23.09) per ton, with £4 15s. 6d. (\$23.21) per ton being asked by some mills. Sheet bars are quoted at £4 18s. (\$23.82), f.o.b. Antwerp.

Prices on beams have receded slightly on some sizes, and current quotations range from £4 17s. 6d. per ton (1.07c. per lb.) for normal specifications to £4 18s. per ton (1.08c. per lb.) for British material. Steel bars are quoted at £5 16s. 6d. per ton (1.28c. per lb.), but mills are well booked with orders and when early September delivery is specified 1s. (24c.) per ton is more usually asked.

In the domestic market the trend of prices continues upward, and some large transactions completed early this month have served to strengthen this movement. Certain mills, which recently appeared willing to accept comparatively low prices to obtain a

French Market Much Stronger

Domestic Prices Still Advancing—Exports Good Except in Pig Iron Where British Competition Is Keen

PARIS, FRANCE, Aug. 13.—All iron and steel markets are quite active despite the midsummer holiday period. Prices continue to advance, and pro-

ducers are beginning to complain of a shortage of labor, voicing some objection to the 8-hr. day law, which they claim forces them to refuse or-

British and Continental European prices per gross ton, except where otherwise stated, f.o.b. makers' works, with American equivalent figured at \$4.86 per £ as follows:

Durham coke, del'd.....	£0 17½s.		\$4.25	
Bilbao Rubio ore*.....	1 2	to £1 2½s.	5.35	to \$5.48

(a) Nominal.

backlog, are refusing to offer any concessions and in some instances have advanced their base prices by as much as 20 fr. (78c) per ton. Increases of 40 and 50 fr. (\$1.56 and \$1.95) per ton have been asked by some makers, who are particularly well booked with orders.

Open-hearth steel continues scarce and shows even greater firmness than Thomas grade, with a number of mills quoting considerable advances when open-hearth material is specified. Compared with prices ruling in May, the present market shows a general increase of from 60 to 70 fr. (\$2.34 to \$2.73) per ton on Thomas grade and 90 to 100 fr. (\$3.51 to \$3.90) per ton on open-hearth grade.

Foundries are fairly well occupied with business. Wire and nail prices are beginning to show more firmness than for several months, and many

wire drawing mills are booked with sufficient tonnage to carry them for three to four months.

Contracts for railroad rolling stock are in prospect in consequence of the recent railroad accident at Le Mans, where five post office officials were killed. The French Post Office Administration has decided to call for immediate tenders on 90 to 114 steel-frame railroad mail cars, each 20 meters long, bids to be opened the latter part of September. It is reported that the Chemin de Fer du Midi has placed an order for 100 electric locomotives and 15 "automotrices" with the Siemens-Schuckert Werke, G.m.b.H., Berlin, and the Ateliers de Constructions Electriques de France. The German company is filling its share of the contract on reparations account.

that an agreement for introduction on the French railroads of Kunze-Knorr brakes has been signed by the railroads and sanctioned by the Reparations Commission, payment being on reparations account.

Statements have been made that French and British contractors have received large railroad concessions in Afghanistan, but according to German reports the Allgemeine Bau-Gesellschaft Lens of Berlin has secured an option on all Afghan public railroad construction and a further concession to operate the roads when built. It is understood that this company will work with the firm of Dysckerhoff & Widmann, both corporations belonging to the A. G. für Verkehrswesen. Several German engineers are reported to have left for Afghanistan recently. The financing of the railroad construction is to be international.

German Domestic Business Declining

Unemployment Greater Than a Year Ago—Export Trade Is Better
—Locomotive Shops Seek Government Aid

BERLIN, GERMANY, Aug. 10.—Business continues to decline slowly and the number of unemployed is larger than in August, 1927, although there has been some improvement in seasonal industries. The coal market is more active, but chiefly because the Ruhr Coal Syndicate is selling at lower prices in the districts where British, Polish and Dutch exporters compete.

Reports of an impending agreement on coal with British producers are generally disregarded. It is pointed out that preliminary discussions have taken place in the past, but that no agreement is possible until the British mines have organized a syndicate that is representative and has authority in the industry. Five years were required to create the Ruhr syndicate, which has unified practically the entire German coal industry, and it is suggested here that it may take as long to establish a similar British syndicate. Only a far-reaching organization could enforce international price agreements. At present the Ruhr Coal Syndicate is seeking lower railroad rates, especially to the North Sea Coast, where British coal is entering Germany in large quantities.

The domestic market on iron and steel is quiet, and in pig iron British material is a considerable factor, particularly in North Germany. The iron and steel scrap market is dull and imports of scrap have declined considerably, dropping from 54,000 tons in April to 12,500 tons in June. At the same time exports of scrap have increased from 16,700 tons in April to 26,700 tons in June. About the most active product in the domestic field is steel bars. Export business has shown considerable improvement recently, and export prices, following a slight decline in the early part of July, are again quite firm. The Stahlwerksver-

band has advanced its price on bars by 2 to 3s. (48c. to 73c.) per ton, f.o.b. Antwerp, since the beginning of August.

Production of pig iron in July was 1,034,694 metric tons, compared with 1,021,350 tons in June and 1,108,893 tons in July, 1927. The increase in July over June was partly because of the greater number of working days.

Mills Fairly Well Booked

Mills rolling semi-finished material are booked with orders sufficient to carry them for four to five weeks; bar mills have two months' work, structural mills about six weeks' work and band and sheet mills about four weeks' work. New business, however, is small, with foundries and machine shops rather inactive. Output of pig iron and steel ingots in Upper Silesia has declined more rapidly than in West Germany. Output in the first part of this year was considerably less than in the same period of 1927.

The foreign trade balance in heavy iron and steel is much better this year than in 1927, but not so good as in 1926, which was a poor year for domestic business. Imports of machinery in the first half of this year totaled 35,318 tons, and exports were 253,669 tons. Domestic demand for most types of machinery has declined, but some good foreign orders are being booked, several for payment on reparations account.

Germans to Electrify French Railroad

The Southern Railroad of France has decided to electrify 1100 km. of its line and has placed a contract with the Siemens-Schuckert Werke, G.m.b.H. and the Ateliers de Constructions Electriques de France. It is understood that the Maffei A.G., Munich, will supply the mechanical parts of the electric locomotives to be furnished. From Paris it is reported

Locomotive Plants Ask State Aid

The locomotive builders have requested the Government to make a loan of 50,000,000 m. (\$11,905,000) to the Railroads Corporation to enable it to order needed locomotives, and has also asked the state to collaborate in a plan for reorganizing the 20 existing locomotive companies. The plan calls for elimination of the less efficient plants and state credits to them to permit adaptation of their shops to other products. The Government has rejected this suggestion and states that the industry must solve its own problems. In justification of its claims, the industry has submitted statistics showing the decline in the number of locomotives sold to three classes of buyers since 1912. Of 4052 sold in 1912, state railroads took 1367, private railroads 1330 and 1355 went for export. In 1926 only 615 locomotives were sold, of which 72 went to state railroads, 143 to private railroads and 400 were exported. In 1927, of 870 locomotives, 119 went to state roads, 321 to private roads and 430 were exported. For 1928 the Railroads Corporation is buying only 100 locomotives, while it is estimated that the normal requirement of the corporation should be about 800 a year. In some pre-war years the state railroads took as many as 1600 locomotives. The decline in requirements is attributed to loss of territory, electrification and the more efficient use of old locomotives. Even if export trade improves, many of the present plants will be forced to suspend operation.

Czechoslovakian Mills Advance Prices

WASHINGTON, Aug. 25.—An increase of 10 per cent in the domestic price for steel has been announced by the Czechoslovakian producers, says a report to the Department of Commerce from Prague. The new prices became effective July 20 and apply only to non-special steel. No revision of prices on special grades is contemplated at this time.

European Plants Adopting Our Methods

Mass Production Being Studied by Progressive Manufacturers Abroad—Demands for American Machinery of Improved Design

AMERICAN machine tool builders who have kept in the lead in designing improved tools will have a good field for their product in the European market for a long time, but those who have not revamped their lines of machinery will find it difficult to compete with foreign machinery. American machinery manufacturers must keep improving their machines so that they will keep ahead of their foreign competitors.

These are some of the conclusions drawn by F. H. Chapin, president National Acme Co., Cleveland, who has just returned from an extended European trip. While he went abroad for pleasure, he made some study of industrial conditions in England, France, Belgium, Germany and Italy. The most promising European countries for American machinery at present, in his opinion, are Belgium, Germany and Italy. Though labor is cheap in Europe, he found a tendency among manufacturers to get costs down in order to reduce prices, so that consumers will buy manufactured products more freely.

Mr. Chapin predicted a boom in the automotive industry in Europe, predicting this on the desires of the people for modern conveniences and the very small percentage of the people in Europe who now own motor cars. He discovered considerable tendency among European metalworking plants to adopt American mass production methods. In an Italian plant he met two American engineers who had been engaged to introduce our methods of mass production and he said that Germany is sending young men to this country to work in shops and learn American production methods.

The people in France, Mr. Chapin found, have money and are taking a more liberal attitude toward spending it. This is evidenced by a great deal of building going on outside of areas devastated by the war. He also found that manufacturing industries are picking up in that country. France is buying merchandise on price and is not deterred by war animosities from buying German goods.

England still has her problems, he said, but has always shown the ability to solve them. While England has her hand firmly on the trade in her colonies, the minor industries in her colonial possessions are owned by the colonies themselves.

While Belgium is still suffering from the effects of the war, its metalworking industries, particularly the automotive industry, are expanding. Germany, he said, has accumulated what is equivalent to two billion dollars in savings accounts since the war, compared with four billion dollars before the war, and can and will pay her reparations.

In Italy he found an industrial awakening and a decided impetus in metalworking industries.

Foreign Competition Slows Up Scottish Plants

WASHINGTON, Aug. 25.—The iron and steel works of the west of Scotland were moderately well employed throughout the second quarter of 1928, conditions generally being somewhat better than a year ago, according to G. E. Chamberlain, consul general at Glasgow, Scotland. Owing to the increased output of the shipyards of the district there has been a fairly steady demand for heavy plates and shapes, and some plants engaged in the production of these materials have been busy.

Light sheet makers, although maintaining a good volume of production, have found it more difficult to obtain orders both for home consumption and export. There has been a moderate demand for galvanized sheets. Bar iron makers are reported to be greatly in need of business, and there is still slackness in the demand for re-rolled steel. Some improvement was noted in the tube trade of the district during the closing weeks of the quarter, especially in demand for butt-welded pipe, and considerable quantities of this material are being exported.

The pig iron market experienced little activity, and at the close of the quarter only 21 furnaces were in blast. The production of light castings, which is chiefly confined to Falkirk and vicinity, has been considerably below normal, and much unemployment is reported in this branch of industry. Foreign competition both in the domestic and the export market is blamed for the present condition, and an effort is being made to reduce production costs by lowering wages.

Foreign Steel Imports Small —Export Trade Quiet

NEW YORK, Aug. 28.—Arrivals of European steel for sale to American consumers have begun to diminish, as, with the exception of a few importers in New York who still have some small tonnages of low-priced material coming in, there is little possibility of selling foreign material at the present high prices. Steel bars have been at a prohibitive level for some time and shapes, except in cases where distress tonnages had been purchased abroad by importers, represent but little saving from the price of American mills. Until recently importers were selling some small

tonnages of hoops and bands, but, with Continental prices higher, a Southern mill has met the quotations of the importers on this material. This occurred in the past week on about 800 tons of hoops bought by a Southern maker of barrels, the material being for delivery into Georgia and Florida.

Exports of iron and steel are confined almost entirely to small lots of material going to the Far Eastern and South American markets. There is some demand for tin plate for shipment to South American meat packing plants, and there are a few inquiries from Japan for small lots of tin plate, including about 20,000 base boxes of canners' tin plate for the provision department of the Imperial Army. Japanese demand for light-gage black sheets continues at a low level with the price in Japan considerably reduced, galvanizing plants having curtailed operations since the inception of the Chinese boycott that grew out of the Manchurian situation. Among recent inquiries from Japan is a small list of railroad car material for the Imperial Government Railways.

American Metallurgists to Hear Hatfield

As has been customary, the distinguished foreign guest who delivers the annual lecture before the American Society for Steel Treating will tour the Eastern States and speak at various places before returning to his home. This year Dr. W. H. Hatfield, who will present the Campbell Memorial lecture in Philadelphia, Oct. 10, will arrive in this country the first of that month. In addition to the memorial lecture he comes prepared to discuss the following subjects:

"Application of Science to the Steel Industry."

"Ingot Making, Manipulation and Treatment."

"Heat Resisting Alloys of Iron."

"Rust and Acid Resisting Steels."

"Steels of Special Physical Characteristics."

"Tool Steels, both Carbon and High Speed."

One or more of these lectures are now scheduled to be given at the following times and places:

Oct. 2; Hartford Chapter, A. S. S. T.
Oct. 3; Providence Chapter, A. S. S. T.
Oct. 4, 5 and 6; Yale University, Hammond Laboratory.
Oct. 7; Boston Chapter, A. S. S. T.
Oct. 8, 9 and 10; Massachusetts Institute of Technology.
Oct. 12; New York Chapter, A. S. S. T.
Oct. 15; Washington Chapter, A. S. S. T.
Oct. 17, 18 and 19; Carnegie Institute of Technology.
Oct. 22; Canton Chapter, A. S. S. T.
Oct. 24; Detroit Chapter, A. S. S. T.
Oct. 26 and 27; University of Michigan.
Nov. 5; Syracuse Chapter, A. S. S. T.

A new municipal barge line terminal at Dubuque, Iowa, was officially opened on Aug. 16. A number of other cities on the Mississippi River have established barge terminals, providing convenient connection between rail and water carriers.

Machinery Markets and News of the Works

Machinery Outlook Good

Brisk Midsummer Business Indicates to Trade a Healthy Fall Demand—Prospects Are Plentiful

HAVING enjoyed one of the most active midsummer periods in years, the machine tool industry now looks forward to a healthy, steady fall business, an expectation which is based partly on the fairly large volume of pending inquiries, on many of which action has been delayed by prospective purchasers because of vacation absences.

For the country as a whole, August business will probably equal that of July. In the New York district, where there was unusually heavy buying in July, the August total may not equal that of the preceding month, but reports from Chicago indicate that the present month may be one of the best of the year in that market.

Inquiry for tools is steady from nearly all branches of the metal-working industry. Railroads have bought lightly, but the prospects of increased business from that source appear somewhat more promising. The Rock Island and the Burlington are expected to place orders shortly at Chicago against recent inquiries. The Missouri Pacific and the New York Central have each inquired for a number of tools. The Missouri-Kansas-Texas has bought a few machines.

In the automotive field, the plans of the Lancia Motors of America, Inc., N. Y., are interesting the machine tool trade. The company is figuring on equipment for a production of 10 to 25 cars a day. The Kissel Motor Car Co., Hartford, Wis., will manufacture taxicabs, and it is reported that plant facilities will soon be doubled. In the accessory field, the purchase of a number of machines by the Gabriel Snubber Mfg. Co., Cleveland, featured the week's business in the Cleveland market.

New York

NEW YORK, Aug. 28.—The General Electric Co., Schenectady, N. Y., was again the principal buyer of machine tools in the past week, its orders totaling \$25,000 or more. The New York Central has inquired for a number of machines. Business continues at a fairly steady pace, though the August totals for many sellers may be lower than those of July. The Lancia Motors of America, Inc., which recently took over the former Fiat automobile plant at Poughkeepsie, N. Y., for the manufacture of Lancia automobiles in this country, is getting initial figures on equipment for a production of 10 to 25 cars per day. Some of the parts will be brought over from Italy at first, but the company expects to make the entire car in this country eventually. Anthony M. Flocker is president and Ralph De Palma, racing driver, is interested in the company in an executive capacity.

Among the week's sales of the Niles-

Bement-Pond Co. were a 144 x 96 x 32-in. planer, a 90-in. heavy driving wheel lathe, a 100-ton bushing press, a 20-in. Niles-Acme shaper and an 18-in. x 16-ft. Boye & Emmes lathe. The Pratt & Whitney division had an exceptionally active week, its sales including 12 lathes of various sizes, six jig borers, two die sinkers, three drilling machines, two universal bench millers, four gear shavers, two vertical surface grinders, a rotary surface grinder, two vertical shapers and six profiling machines.

Porter-Cable Machine Co., Syracuse, N. Y., has received order from Poland for 16 Porter-Cable high-speed production lathes.

Scully Mfg. Co., 208 Broad Street, Elizabeth, N. J., has been organized with capital of \$125,000 to manufacture stoves, gas and coal ranges and hot water heaters. Company will also operate jobbing foundry to make brass, bronze, aluminum and gray iron castings. Plant will be built and equipment purchased.

Zarkin Machine Co., Inc., temporarily at 99 John Street, New York, has been organized to manufacture lithographing and printing press machinery, specializ-

ing on Zenith graining machine. Plant is located at 363 Cherry Street, New York, and company is in market for raw materials.

Boylnton Perco Boilers, Inc., 245 West Broadway, New York, has been organized to manufacture under contract line of steam, vapor and water boilers. Company also expects soon to place on market new type of radiator valve.

International Nickel Co., 67 Wall Street, New York, has authorized sale of new stock to total about \$12,000,000, and will use in part for proposed expansion at Frood properties, Sudbury, Ont., for which a fund of about \$14,000,000 will be required during next 36 months for hydroelectric power equipment, concentrating machinery, additions to smelting plant, installation of electrolytic processes, and underground and surface machinery.

Superintendent of lighthouses, Staten Island, will receive bids until Sept. 6 for 300 acetylene cylinders complete, each with capacity of 88 cu. ft.; proposal 27830.

Department of Mental Hygiene, Capitol Building, Albany, N. Y., will receive bids until Sept. 12 for machinery for two double-end steel Diesel-electric ferries for Manhattan State Hospital, Wards Island, New York, as per specifications at office of Department of Public Works, Division of Architecture, Albany; and Flatiron Building, New York.

Officials of Swan-Finch Oil Corporation, 522 Fifth Avenue, New York, a unit of Standard Oil Co., 26 Broadway, have organized a subsidiary to be known as Swan-Finch Refining Co., with capital of \$500,000, to establish and operate a new refining plant for gasoline production. Parent company operates plants at Bayonne, N. J., Buffalo, N. Y., and Chicago, for manufacture of lubricating oils, greases, etc.

International Paper Co., 100 East Forty-second Street, New York, has approved construction of new newsprint mill near Dalhousie, N. B., to cost close to \$2,500,000 including machinery.

Consolidated Instrument Co. of America, Inc., 41 East Forty-second Street, New York, manufacture of air speed indicators, oil pressure gages and other precision instruments, plans establishment of new assembling plant, as well as new laboratory for experimental and research work, for production of present and new instruments. Company will also secure substantial interest in Aircraft Control Corporation, and will expand such line of production. A stock issue of 40,000 shares will be sold to carry out program. Joseph Leopold is president.

Greenburgh School District No. 9, Elmsford, N. Y., is considering installation of manual training equipment in new two-story high and grade school to cost about \$250,000, for which plans are being drawn by Knappe & Morris,

The Crane Market

VERY little new inquiry for overhead or locomotive cranes has appeared in the past week, and not much activity seems to be expected by sellers until after Labor Day. Several inquiries for prices on used locomotive cranes are in the market. An inquiry for nine small capacity hand power cranes is reported current, the buyer unnamed. A 10-ton hand power

crane for Lehigh University, Bethlehem, Pa., is still pending, and the General Electric Co., Schenectady, N. Y., is not yet reported to have closed on several small capacity electric cranes. Bids are being received until Sept. 10 by the Colombian Government for the Ferro Carril Central Del Norte, Section 2a, on a 20-ton electric overhead crane.

Among recent purchases are:

Elmira Foundry Co., New York, 22-ton, 8-wheel, gasoline engine operated locomotive crane from Orton Crane & Shovel Co.

St. Louis Municipal Waterworks, St. Louis, 20-ton crane for pumping station from Shaw Crane Works.

171 Madison Avenue, New York, architects.

R. H. Macy & Co., Inc., Thirty-fourth Street and Broadway, New York, department store, has engaged Robert D. Kohn, 56 West Forty-fifth Street, architect, to prepare plans for multi-story storage and distributing plant, with mechanical handling-equipment, 325 x 350 ft., on Frelinghuysen Avenue, Newark, N. J., estimated to cost about \$200,000.

T. A. Meyer, 150 East Forty-first Street, New York, architect, has plans in preparation for fifteen-story automobile service, repair and garage building at 319-25 East Thirty-ninth Street, to cost close to \$650,000 with tools and equipment.

Consolidation plans have been arranged by Improved Equipment Co., 24 State Street, New York, and Russell Engineering Co., St. Louis, both manufacturers of coal gas plants, carbonizing equipment, etc., under name of Improved Equipment-Russell Engineering Corporation. Company plans expansion and development program for increased production of gas benches, ovens and kindred machinery. It will be operated under direction of Henry L. Doherty & Co., 60 Wall Street, New York, engineers and operators of public utility properties.

Triplex Safety Glass Co. of North America, Inc., Hoboken Terminal Building, Hoboken, N. J., manufacturer of non-shatterable sheet glass products, is concluding arrangements for purchase of factory property at Clifton, N. J., and will remodel and equip for new plant. Company will also carry out expansion and improvement program for larger output, and has arranged for increase of \$1,000,000 in capital, bulk of fund to be used for such purpose. Amory L. Haskell is president.

Burstyn & Heftler Corporation, 404 Thirty-eighth Street, Jersey City, N. J., is planning construction of eight-story automobile service, repair and garage building at 871 Bergen Avenue, to cost in excess of \$500,000 with tools and equipment.

Pioneer Iron Works, Inc., 317 Frelinghuysen Avenue, Newark, plans construction of addition on adjoining site to cost close to \$30,000 with equipment. L. J. Siegler is president.

Bayonne Bolt Corporation, Second Street and Trask Avenue, Bayonne, N. J., has filed plans for one-story plant, 150 x 235 ft., to cost in excess of \$75,000 with equipment.

Board of Education, South River, N. J., plans installation of manual training equipment in two-story and basement high school addition, to cost about \$150,000, for which bids have been asked on general contract. Alexander Merchant, 52 Paterson Street, New Brunswick, N. J., is architect.

Philadelphia

PHILADELPHIA, Aug. 28.—Wiley-Ellis Co., 210 North Thirteenth Street, Philadelphia, manufacturer of laundry machinery and parts, will soon begin work on new one-story plant at 1223 South Tallman Avenue, Chicago, reported to cost close to \$150,000, with equipment.

United Engineers & Constructors, Inc., 1401 Arch Street, Philadelphia, has been engaged to make surveys and prepare plans for a municipal power project at Austin, Tex., and will carry out entire program, including purchase of necessary equipment.

Philadelphia Gas Works Co., operated by United Gas Improvement Co., 1401 Arch Street, has purchased property, 480 x 480 ft., on block bounded by Fifty-seventh and Fifty-eighth Streets, Eastwick Avenue and Lindbergh Boulevard, as site for new storage and distributing plant, to cost approximately \$1,000,000, with equipment.

Hamilton Township Board of Education, Trenton, N. J., is considering installation of manual training equipment in new high school at Clinton and Park Avenues, to cost \$650,000, in which amount fund has been authorized by public vote. Plans will soon be drawn.

American Brown Boveri Electric Corporation, Camden, N. J., manufacturer of heavy electrical machinery and operating former local shipyard of New York Shipbuilding Co., is in negotiation with City Commissioners, Newark, N. J., regarding proposed establishment of plant at municipal airport, Port Newark, for production of dirigible aircraft, primarily for assembling work, reported to cost more than \$1,000,000.

Armstrong Mfg. Co., Waterloo, Iowa, manufacturer of well-drilling machinery and parts, has acquired property at Sixteenth and Mayflower Streets, Harrisburg, Pa., and plans new factory branch and distributing plant, one-story, 100 x 300 ft., reported to cost in excess of \$40,000, with mechanical equipment.

State Prison Department, Harrisburg, Pa., plans replacement of rock-crushing plant at Rockview penitentiary, near Bellefonte, Pa., destroyed by fire, Aug. 20, with machinery loss reported at \$15,000.

Reading Railroad, Reading Terminal, Philadelphia, has work under way on new engine house with repair facilities at Shamokin, Pa., reported to cost more than \$200,000, and is scheduling completion at early date.

Pennsylvania Water & Power Co., Holtwood, Pa., has begun preliminary surveys for hydroelectric power development at Safe Harbor on Susquehanna River. Entire project is reported to cost more than \$3,500,000.

Board of Trustees, Lafayette College, Easton, Pa., will soon take bids on general contract for new mining engineering building at institution, to cost more than \$200,000, with mechanical equipment. Charles Z. Klauder, 1429 Walnut Street, Philadelphia, is architect.

City Council, Monessen, Pa., has secured property on Pricedale Road and plans municipal airport, including hangar, repair and reconditioning shop and other buildings.

Spicer Mfg. Co., Norristown, Pa., manufacturer of universal joints, automobile shafting, etc., has begun work on one-story addition, reported to cost more than \$35,000, with equipment.

Davis Brothers, Inc., 4250 Wissahickon Avenue, Philadelphia, manufacturer of spikes, nails, etc., has taken out permit for a one-story addition, reported to cost about \$18,000.

Norman Aircraft Co., Burlington, N. J., recently organized, has taken over property at Barclay and Stacy Streets, and plans early establishment of new plant for production of airplanes, with initial operations devoted primarily to assembling.

Pittsburgh

PITTSBURGH, Aug. 27.—Machine tool inquiries are more numerous than they have been. In sales, most of the trade have done better in the past week than in the first two weeks of the month. The Westinghouse Electric & Mfg. Co. has awarded some more orders against its third quarter list.

Allegheny Gear Works, Inc., 1013 Empire Building, Pittsburgh, forgings manufacturer, has changed name to Allegheny Forging Co.

S. Keighley Metal Ceiling & Mfg. Co., 15 Third Avenue, Pittsburgh, maker of steel lockers, has changed firm name to Keighley Mfg. Co.

Scientific Materials Co., 717 Forbes Street, Pittsburgh, manufacturer of pressure and vacuum gages, recording instruments, optical benches, pyrometers and hardness testing machines, has changed name to Fisher Scientific Co.

Contract has been let by United States Aluminum Co., operated by Aluminum Co. of America, Inc., Oliver Building, Pittsburgh, to C. A. Fritz, Pittsburgh general contractor, for new plant on Post Road, Fairfield, Conn., comprising main one-story unit, 220 x 477 ft., and two auxiliary structures, one-story, 65 x 140 ft., and two-story, 30 x 120 ft., to cost in excess of \$200,000, with equipment.

Oliver Iron & Steel Works, Pittsburgh, has filed plans for one-story addition to plant at Tenth and Muriel Streets.

West Virginia Hydro-Electric Co.,

Charleston, W. Va., recently organized by Thomas Richardson and L. W. Van Bibber, both of Charlottesville, Va., where main offices will be established, is reported planning early development of hydroelectric power facilities in Raleigh and Summers Counties, W. Va.; sites are being selected. Project is reported to cost more than \$350,000.

West Virginia Rail Co., Seventeenth Street, Huntington, W. Va., has approved general expansion and improvement program to cost more than \$450,000. Company has recently secured local property heretofore held by Huntington Sash, Door & Trim Co., and will remove fabricating plant to that site, where capacity will be increased with additional equipment. Mill No. 2 will be electrified and new machinery installed for production of steel mine ties, spike rods, reinforcing steel bars, etc. It is proposed to build a new unit for this department of the plant next year. Mill No. 1 will be extended and improved. H. Z. Zeller is vice-president and general manager.

South Atlantic

BALTIMORE, Aug. 28.—Bids will soon be asked by United Railways & Electric Co., Continental Building, Baltimore, for one and two-story service, repair and garage building for motor buses, reported to cost in excess of \$175,000, with equipment. W. H. Emory, 18 East Lexington Street, is architect.

Supervising architect, Treasury Department, Washington, will receive bids until Sept. 18 for motor-generator sets and auxiliary equipment for United States Mint at Philadelphia.

American Chatillon Corporation, Rome, Ga., has awarded general contract to Hughes-Foulkrod Co., Commonwealth Building, Philadelphia, for new local rayon mill to cost about \$3,000,000, including power house, machine shop, filter plant and other mechanical units. Headquarters are at 393 Seventh Avenue, New York.

Standard Oil Co., St. Paul and Franklin Streets, Baltimore, has plans nearing completion for additions to refining plant on Eighth Street, Canton, comprising three buildings, 55 x 105 ft., and two 32 x 60 ft., with installation of gasoline refining equipment, tanks, etc., reported to cost \$200,000. Headquarters are at 26 Broadway, New York.

Commission on Public Improvements, Municipal Office Building, Baltimore, is considering installation of manual training equipment in proposed new four-story junior high school on Barrington Road, near Garrison Boulevard, reported to cost close to \$1,000,000, with equipment. Smith & May, Calvert Building, are architects.

Burns Bottling Machine Works, 2329 Taylor Street, Baltimore, manufacturer of automatic bottling machinery and parts, is planning one-story addition, about 43 x 65 ft., to cost about \$30,000, with equipment.

General Purchasing Officer, Panama Canal, Washington, is asking bids until Sept. 10 for 4,000 ft. galvanized chain, 53,100 ft. wrought iron or steel galvanized pipe, 100 engine lubricators, 15,000 ft. rubber insulated copper wire, 30 electric drills, 50 water heaters, staybolts, boiler tubes and other mechanical equipment, Panama circular No. 1898.

International Harvester Co., 606 South Michigan Avenue, Chicago, has awarded general contract to F. L. Wagner, Inc., 1336 New York Avenue, N. W., Washing-

ton, for one-story motor truck factory branch, service and repair works on Bladensburg Road, N. E., Washington, to cost about \$100,000, with equipment. C. B. Rafter, Barr Building, Washington, is consulting engineer.

Officials of Diez-Roemer Brass Co., 212 Fallsview Street, Baltimore, manufacturer of brass castings, etc., have organized a new company under name of American Brass & Fire Equipment Corporation to take over and expand present organization. New company has acquired American Fire Extinguisher Co., Baltimore, and will consolidate with Diez-Roemer organization. An expansion program will be carried out for increased production. Conrad J. Diez is company official and chief engineer.

Simmons Co., Kenosha, Wis., manufacturer of metal bedsteads, springs, mattresses, etc., has acquired controlling interest in Rosemary Mfg. Co., Roanoke Rapids, N. C., and will continue operation of mill as factory branch for production of mattress specialties and other products. An expansion and improvement program is said to be under consideration.

Great Northern Utilities Co., 3933 Drexel Boulevard, Chicago, plans construction of artificial gas plant and system at Piedmont, S. C., and vicinity, including pipe lines to more than 40 communities in this section. Initial plant will include water-gas machinery, gas compressors, purifiers, and auxiliary equipment, with number of storage and distributing plants in different districts. Entire project reported to cost more than \$4,000,000. Arthur J. Smith is head.

Buffalo

BUFFALO, Aug. 27.—Continental Can Co., Rochester, N. Y., has concluded negotiations for purchase of New Orleans Can Co., New Orleans, La., and will consolidate with organization. New Orleans plant will be continued in production as branch factory and expansion is being considered. Company recently acquired Southern Can Co., Baltimore, and is maintaining branch plant in that city.

Old Forge Electric Corporation, Old Forge, N. Y., has applied for permission to take over local municipal power plant as well as municipal utility properties at Webb, heretofore served from first noted station. Petition states that upon acquisition, extensions and improvements will be made in power plant, including installation of additional equipment.

Likly Luggage Co., Lydell Avenue, Buffalo, manufacturer of metal trunks etc., has acquired group of buildings at Fitchburg, Mass., heretofore held by Amoskeag Mfg. Co., and used for textile production, and will remodel and improve for main plant. Entire Rochester works will be removed to new location and additional equipment provided for increased output.

Binghamton Light, Heat & Power Co., Binghamton, N. Y., is planning extensions in power plant, transmission lines and other operating facilities, including installation of additional equipment. Company has arranged for increase in capital from 175,000 to 275,000 shares of stock, the majority of proceeds to be used for program. It is operated under direction of General Gas & Electric Co., 50 Pine Street, New York.

Department of Public Works, Municipal Building, Buffalo, will receive bids until Sept. 4 for construction of new hangar at Buffalo airport, Cheektowaga,

with repair and reconditioning facilities, as per plans and specifications on file. George F. Fisk is commissioner.

Pierce Arrow Motor Car Co., Buffalo, has been chartered under State laws with capital of 8,000,000 shares of preferred and 427,375 shares of common stock, to take over and expand company of same name with local plant on Elmwood Avenue, particularly in connection with increase in motor truck output. New company is affiliated with Studebaker Corporation, South Bend, Ind., which has secured a controlling interest. A. R. Erskine, head of last noted company, will be chairman of board; M. E. Forbes, president; and B. H. Warner of Studebaker organization, vice-president in charge of manufacturing.

Cleveland

CLEVELAND, Aug. 28.—Machine tool dealers did a fair volume of business, mostly in single machines, in the past week and the August volume may show a slight gain over that of July. Business is coming almost wholly from manufacturers of automobile parts. Die sinkers are in very active demand from this source. Among orders placed during the week was one from the Transue & Williams Steel Forging Corporation, Alliance, Ohio, for four die sinkers. The Gabriel Snubber Mfg. Co., Cleveland, has purchased quite a number of machines for the manufacture of shock absorbers. The Perfection Stove Co., Cleveland, which is getting into the manufacture of automatic refrigerators, purchased a jig boring machine. Automatic screw machines are moving in fair volume and deliveries on these and some other lines of machine tools have slowed down considerably.

Charles T. Topping Machinery Co., manufacturer of excavating machinery, has removed its general offices from Dayton, Ohio, to 4403 St. Clair Avenue, Cleveland. Company has also completed arrangements providing enlarged manufacturing facilities, but will purchase no additional equipment. It is expected that new types of excavating equipment will be announced as soon as development work is completed.

Bell Metal Stamping Co., Cleveland, has been organized and has established a plant at 1784 East Thirty-seventh Street, where it is engaged in the manufacture of light metal stampings. Herbert L. Bell is manager.

Contract has been let by Grabler Mfg. Co., 6565 Broadway, Cleveland, manufacturer of hangers, clamps, etc., to S. W. Emerson Co., 1836 Euclid Avenue, for one-story addition, 40 x 80 ft., estimated to cost \$40,000 with equipment. Christian, Schwarzenberg & Gaede, Euclid Building, are architects.

Midland Steel Products Co., Madison Avenue and West 106th Street, Cleveland, manufacturer of automobile frames, four-wheel brakes, and other automotive equipment, is arranging an immediate expansion program for extensive increase in present output, reported to cost more than \$200,000 with equipment. It is proposed to develop increase of close to 2000 frames and more than 1000 brake sets over present capacity. E. J. Kulas is president.

Triplex Screw Co., 6112 Central Avenue, Cleveland, has awarded general contract to J. L. Hunting Co., Guarantee Building, for one-story addition, 40 x 122 ft., to

cost approximately \$35,000 with equipment. A. F. Weber is head.

Hinde & Dauch Paper Co., Sandusky, Ohio, manufacturer of corrugated paper board products, has approved plans for new mill at Winnipeg, Man., consisting of several units with boiler plant, machine shop, and other mechanical buildings, reported to cost close to \$1,000,000. O. H. Moore, general manager, will supervise erection.

Aetna Rubber Co., 815 East Seventy-ninth Street, Cleveland, manufacturer of hard and soft molded mechanical and other rubber goods, has begun construction of new plant addition at Ashtabula, Ohio, to consist of two manufacturing units, 60 x 180 ft., and 60 x 92 ft., and one-story machine shop, to cost close to \$125,000 with equipment. Webster Co., Ashtabula, is general contractor. S. T. Campbell is president and general manager.

Board of County Commissioners, Painesville, Ohio, L. J. Spaulding, clerk, will receive bids until Sept. 4 for hydraulic-operated stokers for two boilers, with capacity for handling 800 lb. per hour.

Chicago

CHICAGO, Aug. 27.—Fresh inquiry from widely scattered and miscellaneous sources holds steady and lends support to dealers' hopes that this will be one of the best months of the year. New sales, though not individually large, are numerous. It is reported that the Rock Island Railroad is prepared to place orders against recent inquiries and that the Burlington will soon issue purchase orders. Forgers, gasoline engine builders and tractor manufacturers are among the most active buyers. The Kissel Motor Car Co., Hartford, Wis., will manufacture a line of taxicabs and it is reported that plant facilities will soon be doubled. Used machines are in good demand, but the supply of certain types is limited.

John Deere Tractor Co., Waterloo, Iowa, has filed plans for one-story power house to cost \$35,000.

City Service Gas Co., Wichita, Kan., will expand its gas compressor plants at Mooreland, Okla., Corwin, Kan., and Higgins, Tex.

New power house to cost \$175,000 is being constructed at the Great Lakes Naval Training Station.

Autorad Electric Corporation, Muskegon, Mich., newly organized, has leased space in plant of the Evans-Miller Cedar Products Co., where it will manufacture radio parts and possibly small automobile parts.

American Forge Co., 2621 South Hoyne Avenue, Chicago, will build one-story brick foundry, 80 x 140 ft., to cost \$50,000.

Mohr Mfg. Co., Inc., Marshalltown, Iowa, has been organized to manufacture electric automatic door operator and kindred equipment. Equipment has been purchased and company will buy malleable castings and steel, the most of which has been contracted for.

Central Steel Products Co., Clinton, Iowa, incorporated in 1924 to manufacture pipe nipples, spacers and fabricated pipe, plans to add complete line of plumbing and heating supplies to Clinton plant and to increase production of manufactured products. Company has recently in-

creased capital to \$500,000 to take over business of Cedar Rapids Pump & Supply Co., Cedar Rapids, Iowa, jobber of plumbing, heating and mill supplies, and later main office of Central company will be located at Cedar Rapids. At present offices are maintained in that city at 1018 Merchants National Bank Building. C. A. Depue is president.

Construction Machinery Co., Waterloo, Iowa, has purchased plant and business of Marsh-Capron Co., Chicago Heights, Ill. Both plants will be operated at present and R. C. Weller, president of Chicago Heights concern, will become sales manager of Waterloo company. Harry B. Lichty is president.

Meadows Co., Bloomington, Ill., has sold its patents, rights to manufacture and patterns for blowers, portable elevators and bucket elevators to Hayes Co., Galva, Ill., which will begin immediate production. In future Meadows Co. will confine its activities to manufacture of washing machines.

Contract has been let by Victor Mfg. & Gasket Co., 5750 Roosevelt Road, Chicago, manufacturer of metallic gaskets, etc., to Schmidt Brothers Construction Co., 22 East Huron Street, for four-story addition, 100 x 160 ft., to cost about \$150,000 with equipment. Frank D. Chase, Inc., 720 North Michigan Boulevard, is architect and engineer.

Nordenberg Trunk Works, 406-8 North Clark Street, Chicago, manufacturer of metal trunks, etc., plans rebuilding of portion of factory destroyed by fire Aug. 16, with loss reported at close to \$50,000 including equipment.

Western Electric Co., 11 South La Salle Street, Chicago, manufacturer of telephone apparatus, cables, radio equipment, etc., is said to have plans under way for a new non-ferrous metal mill at Twenty-sixth Street and Cicero Avenue, Cicero, Ill., to cost more than \$2,000,000 with machinery.

Central States Power & Light Corporation, Davenport, Iowa, is disposing of preferred stock issue to total about \$2,167,000, a portion of proceeds to be used for extensions and improvements in power plants and system. H. C. Orton is president.

Water Department, Cedar Rapids, Iowa, plans installation of pumping machinery, power equipment and accessories in connection with extensions and improvements in municipal waterworks, with new source of supply from Prairie Creek, estimated to cost in excess of \$500,000. H. R. Green Co., Bever Building, is consulting engineer.

Durango Natural Gas Co., Durango, Colo., has made application for permission to construct natural gas distributing plant and pipe line, estimated to cost \$200,000.

Board of Education, Minot, N. D., plans installation of manual training equipment in new three-story addition to junior high school, estimated to cost \$250,000, for which bids will soon be asked on general contract. Bugenhagen M. Molander, Union National Bank Annex, is architect.

Cadillac Motor Car Co., 2301 South Michigan Boulevard, Chicago, has awarded general contract to Patterson & Havtich, 140 South Dearborn Street, for two-story service, repair and sales building at 5201-9 Broadway, reported to cost more than \$100,000 with equipment.

Northern Pacific Railway Co., St. Paul, Minn., is completing plans for new steel car repair shop, 110 x 250 ft., at Laurel,

Mont., reported to cost in excess of \$175,000 with equipment, latter to include traveling cranes. T. F. Lowry is general superintendent.

Elco Tool & Screw Corporation, 1800 Broadway, Rockford, Ill., has announced plans for plant addition to cost \$10,000. New building will be two-story brick construction, 26 x 88 ft., and will be used chiefly for shipping and receiving departments.

St. Louis

ST. LOUIS, Aug. 27.—The Missouri-Kansas-Texas Railroad has purchased two Putnam combination car axle and journal and axle lathes, and a Warner & Swasey No. 1A turret lathe. The Wabash has purchased a heavy-duty railroad internal grinder and 34-in. and 40-in. drill presses. The Missouri Pacific is in the market for the following machine tools: 4-ft. radial drill, nipple machine, portable boring bar, small floor grinder and several smaller machines.

Plans are being considered by Chan-deysson Electric Co., 4092 Bingham Avenue, St. Louis, manufacturer of plating electric units and other electrical equipment, for one-story addition, totaling about 10,000 sq. ft. floor space, to cost approximately \$60,000 with machinery. Work is now under way on one-story unit of smaller size, to cost about \$40,000 with equipment. Widmer Engineering Co., Roosevelt Building, is engineer.

City Council, Stanberry, Mo., will soon take bids for municipal light and power plant, including oil engine and other equipment. Henrici-Lowry Engineering Co., Security Building, Kansas City, Mo., is consulting engineer.

Board of Public Service, City Hall, St. Louis, is said to plan early call for bids for addition to power house at Koch, Mo., estimated to cost \$50,000 with equipment; installation will include 500-hp. boiler unit, stoker, etc. J. L. Rilliet, Jr., City Hall, is engineer.

Public Service Co. of Oklahoma, Tulsa, has disposed of bond issue of \$5,000,000, a portion of proceeds to be used for acquisition of additional properties and extensions and improvements in generating and transmission line facilities.

Detroit

DETROIT, Aug. 28.—City Council, Allegan, Mich., is having plans drawn for municipal power plant on Kalamazoo River, to cost about \$500,000, with transmission lines. Ayres, Lewis, Morris & May, Cainwell Building, Ann Arbor, Mich., are architects and engineers.

Wilcox-Rich Corporation is being organized to take over and consolidate Wilcox Products Corporation, Saginaw, Mich., manufacturer of engine valves and other mechanical equipment, and Rich Steel Products Co., Battle Creek, Mich., manufacturer of similar specialties. Merger will include Intra Steel Products Division of Wilcox organization, heretofore operating with headquarters at Detroit. New company will be capitalized at 92,000 shares preferred stock, and 135,000 shares common stock, and plans expansion program for enlarged output.

Board of Water Commissioners, 176 East Jefferson Avenue, Detroit, will receive bids until Sept. 5 for one motor-

driven centrifugal pumping unit with auxiliary equipment, rated capacity of 6,000,000 gal. per day, as per plans and specifications on file. George H. Fenkell is general manager and chief engineer.

Vorclone Corporation has been organized under Delaware laws to take over and consolidate Detroit Laundry Machinery Co., Detroit; Power Brothers Co. and Vorclone Co., Milwaukee, manufacturer of fan equipment and devices, drying tumblers, etc. New company has arranged for preferred stock issue to total \$1,600,000, a portion of proceeds to be used for expansion in production. Monte J. Power is president.

Wisconsin-Michigan Power Co., Iron Mountain, Mich., plans construction of hydroelectric power plant on Sturgeon River, Baraga County, Mich., where tract of about 15,000 acres of land was recently acquired, estimated to cost close to \$3,000,000, scheduled for completion in about 36 months. Headquarters are at Appleton, Wis. Company is operated by North American Edison Co., Cleveland.

Federal Stamping Co., Holland, Mich., manufacturer of stamped metal products, is planning extensions to double, approximately, present capacity, reported to cost more than \$350,000, with machinery.

Copeland Products, Inc., 630 Lycaste Street, Detroit, manufacturer of electric refrigerators and refrigerating equipment, has taken over a building adjoining plant and will use for expansion; it is proposed to double present capacity with new unit.

Keller Tractor & Shovel Co., Inc., 5124 Braden Avenue, Detroit, has been organized by Carl H. Keller and associates to distribute tractors of the Caterpillar Tractor Co., San Leandro, Cal.; gas and air shovels, cranes and draglines made by the Bucyrus-Erie Co., South Milwaukee, Wis., and earth moving machinery and snow plows manufactured by Baker Mfg. Co., Springfield, Ill.

Locklite Co., Iron Mountain, Mich., has been formed to manufacture patent electric light socket. Company has small plant at Iron Mountain, but will have some work done by outside manufacturers. Additional equipment and supplies will be purchased soon.

Olds Motor Works, Lansing, Mich., is preparing for an increase in floor space of 163,150 sq. ft. The new construction will cost about \$1,500,000. It is said that calls from the dealers, following the introduction of the DeLuxe models, equalled the entire production schedule for the remainder of the year.

After Sept. 1 all Chrysler "65" cars will be built in the company's Jefferson Avenue plant in Detroit, where the "75" and Imperial "80" cars are now made. This will leave the entire Highland Park plant devoted to the manufacture of the Chrysler-Plymouth and the new De Soto six line, announced recently. A new building, 1000 ft. long, has been added to the Jefferson Avenue plant to make room for this change, which will be effected without interruption in production.

The Gorham Tool Co., manufacturer of high-speed machine tools, is building an addition to its plant No. 2 on Woodrow Wilson Avenue, Detroit, which includes a second unit on its plant there and a modern office building. After Oct. 1, when it is expected the buildings will be completed, the executive offices will be located at plant No. 2 and a major portion of the tool manufacturing will be done at the new plant.

Gulf States

BIRMINGHAM, Aug. 27.—Plans have been completed by Central Power & Light Co., Frost National Bank Building, San Antonio, Tex., for hydroelectric power project on Devil's River, reported to cost in excess of \$350,000, with transmission line.

Big Spring Pipe Line Co., Big Spring, Tex., recently organized, will soon begin construction of pipe line from that place to Roberts pool district, about 15 miles, with power station and booster plant. It will have capacity of 7500 bbl. per day and will cost in excess of \$300,000. Joseph Edwards is president.

Board of Education, Dallas, Tex., will install mechanical equipment for vocational instruction at high school on Bryan Street, including foundry for aluminum and brass castings, sheet metal shop equipment, automobile repair equipment, welding apparatus, etc. Denman Kelley, principal, is in charge.

Tangipahoa Parish School Board, Independence, La., contemplates installation of manual training equipment in new two-story high school, estimated to cost about \$165,000, for which bids will be asked on general contract early in September. Robert H. Goodman, Bank of Baton Rouge Building, Baton Rouge, La., is architect.

Todd Engineering, Dry Dock & Ship Repair Co., New Orleans, La., is completing construction of new dry dock and ship repair unit to cost approximately \$1,000,000, and will provide equipment and place in service at early date.

Davison-Pick Fertilizer Co., Inc., New Orleans, La., is planning extensions and improvements in plant at Gretna, La., including installation of additional machinery, with two electric traveling cranes for handling cargoes from dock to plant. Entire project will cost close to \$180,000. W. W. Pickens is president.

City Commission, Daytona Beach, Fla., plans installation of pumping machinery and other power equipment, including water-softening apparatus, in connection with proposed extensions and improvements in municipal waterworks, estimated to cost close to \$400,000. Metcalf & Eddy, 14 Beacon Street, Boston, Mass., are consulting engineers.

Asiatic Petroleum Co., 65 Broadway, New York, is reported planning construction of new oil storage and distributing plant at Tampa, Fla., to cost more than \$100,000, with equipment.

Weber-King Mfg. Co., Leesville, La., manufacturer of mechanical equipment, is considering rebuilding of portion of machine shop recently destroyed by fire with loss estimated at close to \$25,000, with equipment.

Southern Natural Gas Corporation, First National Bank Building, Birmingham, Ala., is perfecting plans for extensive pipe line system, with compressor stations, etc., for natural gas supply to a number of cities in Alabama, Mississippi, and adjoining States, with ultimate project to total more than 850 miles, estimated to cost in excess of \$30,000,000. Arthur L. Mullergren, Kansas City, Mo., is consulting engineer. Robert C. Sharp, president and general manager, Oklahoma Natural Gas Corporation, Tulsa, will be in charge of operations.

Phillips Petroleum Co., Bartlesville, Okla., is planning new gasoline refining plant in vicinity of Odessa, Tex., reported to cost in excess of \$100,000, with equipment.

Auto Service Systems, Inc., Houston, Tex., has leased a building at Travis and Calhoun Streets for new service and repair plant, including brake testing and parts departments, and will equip at early date. A one-story addition will be built, 115 x 120 ft. Entire project will cost more than \$90,000. Walter Puckett is vice-president and general manager.

Southwest Tool Supply Co., Big Spring, Tex., plans new factory branch and distributing plant at Forsan, Tex.

New England

BOSTON, Aug. 28.—Although dealers are securing little business, New England machine tool builders generally are operating plants on a normal or better than normal schedule. Some of them are far behind on deliveries. In several instances manufacturers have good export orders. Small tool sales are holding up remarkably well, and indications are those for August will run considerably ahead of the corresponding month last year. The crane market continues lifeless. There is a moderate amount of light conveying equipment selling. It has been a good year for road and concrete machinery, as well as for lifting equipment.

Saco-Lowell Shops, Boston, has practically completed transfer of equipment from Lowell, Mass., to the Biddeford, Me., plant.

Eastern Massachusetts Street Railway Co., 38 Chauncy Street, Boston, has awarded contract for remodeling its South Main Street, Brockton, Mass., repair shop.

Stacy Machine Works, West Springfield, Mass., is about to start a one-story, 40 x 40-ft. plant addition. A. O. Carroll is president.

Work has been started on a one-story and basement, 50 x 125-ft. manufacturing plant addition by Metal Craftsmen, Inc., 101 Georgia Avenue, Providence, R. I.

St. Albans, Vt., is to erect a two-story, 97 x 193-ft. high school to cost, with equipment, \$200,000. It will have manual training and other shops. William H. McLean, 88 Tremont Street, Boston, architect, has completed plans.

Bids closed Aug. 23 on a three-story, 65 x 140-ft. junior high school at Main Street, Agawam, Mass., to contain shops. D. J. Phelps, 57 Reed Street, is superintendent of schools. Paul B. Johnson, 1562 Main Street, Springfield, Mass., is the architect.

Central Maine Power Co., Augusta, Me., will soon begin work on hydroelectric power plant at Burnham, Me., reported to cost in excess of \$500,000 with transmission line.

Aeronautical Products Corporation, Naugatuck, Conn., recently organized with capital of \$500,000, has taken over former local plant of Dunham Mills, Inc., manufacturer of textile products, and will occupy for new works for production of airplane motors. Proposed to provide equipment for initial output of 25 motor units per day. Clarence Austin is secretary; Harris Whittemore, Jr., is treasurer.

Thompson Wire Co., Mildred Avenue, Mattapan, Boston, has awarded general contract to Clark & Smith, Inc., 13 Temple Street, Quincy, Mass., for one-story addition, 60 x 125 ft., reported to cost close to \$50,000 with equipment.

New England Flexible Door Corporation, Winsted, Conn., recently organized,

has concluded negotiations for purchase of former local plant of New England Pin Co., and will improve and occupy for new factory for manufacture of metal and other doors. A fund of \$50,000 has been raised to establish plant and purchase equipment. New England Pin Co. was acquired a number of months ago by Star Pin Co., Derby, Conn., and plant was removed to latter location.

Royal Typewriter Co., New Park Avenue, Hartford, Conn., will begin superstructure for five and six-story and basement addition, L-shaped, 70 x 190 ft., and 70 x 70 ft., to cost more than \$175,000 with equipment. Greenwood & Noerr, Hartford, are consulting engineers.

Colonial Utilities Corporation, Chester, Vt., has been organized to take over Chester Water & Light Co., and 15 other electric light and power, and ice utilities in this vicinity, including Exeter, Rochester and Somersworth, N. H. Properties will be consolidated and expansion program carried out, comprising increase in generating and distributing facilities. New company has arranged for bond issue of \$750,000, considerable portion of proceeds to be used for purpose noted.

Cincinnati

CINCINNATI, Aug. 27.—Bids will be asked early in September by General Aeronautical Corporation, 3336 Trimble Avenue, Cincinnati, for one-story aircraft manufacturing plant at Luken airport, initial unit to be used primarily for assembling, reported to cost more than \$45,000, with equipment. H. Neilson Jackson, Mercantile Library Building, is architect.

Berger Brothers Boiler Works, 257 West Spring Street, Columbus, Ohio, has leased one-story building, 92 x 105 ft., to be erected at 312-22 West Spring Street, for new storage and distributing plant, estimated to cost about \$60,000, with equipment. Bassett & Treselt, 257 East Broad Street, are architects.

Louisville Gas & Electric Co., Louisville, has authorized increase in capital from \$45,000,000 to \$90,000,000, a considerable portion of the fund to be used for expansion in generating and transmission line facilities. T. B. Wilson is vice-president and general manager.

M. D. Larkin Co., 115-21 East Third Street, Dayton, Ohio, manufacturer of machinery and mill supplies, will carry out an expansion and improvement program for increased production. Arrangements are being made for increase in capital from 15,000 to 60,000 shares of stock, no par value, a portion of proceeds to be used for program. Maurice D. Larkin is president.

Armstrong Furnace Co., London, Ohio, is considering plans for new plant unit on Fenninniken Road, Columbus, Ohio, comprising two one-story units, reported to cost more than \$40,000, with equipment. F. B. Armstrong is president.

United States Engineer Office, Chattanooga, Tenn., is asking bids until Sept. 21 for Diesel engine units, complete with generators, exciters, propulsion controls, motors and switchboard, and spare parts.

Formica Insulation Co., 4614 Spring Grove Avenue, Cincinnati, has awarded general contract to Ferro Concrete Construction Co., Cincinnati, for new three-story plant unit reported to cost more than \$80,000, with equipment.

Air Corps, Material Division, Wright Field, Dayton, Ohio, will receive bids un-

til Sept. 5 for one sheet metal cutter, circular 93; for 9000 steel balls, 35,000 asbestos-copper annular gaskets, and quantities of brass chain, steel nails, lead seals, etc., circular 87; until Sept. 4 for 195 sets shielding ignition units, circular 91; for three transformers, four cutouts, knife switch, cable, etc., circular 92; for 100,000 lb. ferrosilicon, circular 88; and until March 7, 1929, for furnishing from two to 200 airplanes.

State Department of Public Welfare, Ninth and Oak Streets, Columbus, Ohio, J. E. Harper, director, will soon take bids for one-story power plant at welfare institution at Apple Creek, estimated to cost \$58,000. H. B. Briggs, Hartman Hotel Building, is architect and engineer.

Milwaukee

MILWAUKEE, Aug. 27.—While machine-tool business lacks some of the snap which has characterized its progress in recent weeks, the rate of inquiry continues active and there is considerable business in prospect. Meanwhile, production is maintained at a rate limited only by the ability of tool builders to secure skilled help, which is unusually scarce in the machinist trade. Order books are well filled and with new business developing at a moderate rate, output schedules doubtless will continue at the present high rate for some time to come.

McNally-Tollefson Foundry Co., Stoughton, Wis., is about to take bids for the erection of a shop addition costing about \$35,000. Work is to start about Sept. 17. John McNally is president.

Gurney Refrigerator Co., Fond du Lac, Wis., is converting its entire tool drive to electric motors and has purchased a 300-hp. Ridgeway engine and generator. E. G. Vail is president and treasurer.

Indiana

INDIANAPOLIS, Aug. 28.—Plans are being considered by Auburn Automobile Co., Connersville, Ind., for a new one-story addition, reported to cost more than \$70,000, with equipment.

State Line Generating Co., Hammond, Ind., operated by Commonwealth Edison Co., 72 West Adams Street, Chicago, has made application for permission to issue notes for \$14,000,000, proceeds to be used in connection with new local steam-operated generating plant, now in course of construction and which is scheduled for completion early in 1929. Entire project will cost \$28,500,000, including transmission lines.

Board of Education, Gary, Ind., is considering installation of manual training equipment in new high school at Twenty-fifth and Harrison Streets, estimated to cost \$850,000, for which plans will be drawn by William B. Ittner, 911 Locust Street, St. Louis, architect.

City Council, Indianapolis, is planning establishment of municipal airport, with hangars, repair and reconditioning shops, oil storage and distributing buildings, and other mechanical units, reported to cost about \$500,000, in which amount bond issue is being arranged. A mayor's committee has been appointed, headed by Fred C. Gardner, chairman, to arrange for project.

Midland Utilities Co., Fort Wayne, Ind., operating Indiana Service Corpora-

tion and other electric light and power utilities at South Bend, East Chicago, Gary, Kokomo, Logansport and other cities, is disposing of bond issue of \$6,000,000, a portion of proceeds to be used for extensions and betterments in plants and system.

Northern Indiana Public Service Co., Lafayette, Ind., plans construction of pipe line to vicinity of Crawfordsville, Ind., about 30 miles, reported to cost in excess of \$175,000. Work is now under way on pipe line between South Bend and Elkhart, Ind. Application has been made for permission to issue preferred stock in amount of \$300,000, portion of fund to be used for expansion.

Canada

TORONTO, ONT., Aug. 27.—At the Canadian National Exhibition, which opened in Toronto on Aug. 24, machine tool builders and dealers from many parts of the world are showing their various lines of equipment. The exhibition of tools and machinery has, as a rule, a stimulating effect on sales during the two weeks they are on display and also tends to strengthen the fall demand. Canadian builders and dealers report a steady demand for tools. More extensive buying is expected from the automotive industry as a result of building plans announced by several companies. Railroads are buying for replacement in car shops, and a few lists are coming out for Canadian National shops at Point St. Charles, Que., and for Western Canada shops of both the Canadian National and Canadian Pacific.

Dominion Lightning Rod Co., Dundas, Ont., is having plans prepared for factory at 63 Main Street.

Chaleur Bay Power Co., Quebec, Que., has awarded contract to T. E. Rousseau, Ltd., 42 Second Avenue, for the construction of power house and dam on Hall River near Bonaventure to cost \$150,000. Langlais, Ricard & Royer, 126 St. Peter Street, Quebec, are the engineers.

Dominion Forge & Stamping Co., Walkerville, Ont., has awarded contract for addition to plant at cost of \$14,000.

Gudie Motor Mfg. Co., 105 Sherbourne Street, Toronto, has awarded contract for \$25,000 plant addition.

Webber Machine Co., 848 Dupont Street, Toronto, Ont., has awarded contract for erection of \$30,000 factory on Birch Avenue.

Flint Paint & Varnish, Ltd., Perth Avenue, Toronto, has awarded contract to Anglin-Norcross, Ltd., Temple Building, for erection of \$150,000 plant addition.

Goodyear Tire & Rubber Co. of Canada, Ltd., New Toronto, Ont., has started work on an addition to its plant there.

New Brass Ware Co. of Canada, Ltd., 2320 Aird Street, Montreal, Que., has awarded contract to the Dakin Construction Co., 270 Beaumont Street, for the erection of a foundry addition, 43 x 100 ft. Foundry equipment not yet purchased.

Willys-Overland, Ltd., Weston Road, Weston, Ont., will build an addition to its plant to be four stories, 60 x 260 ft., for which bids are being received by M. J. Streiffert, engineer.

Jem Rubber Co., 3723 Dundas Street West, Toronto, intends to start work about Sept. 15 on the erection of a manufacturing plant.

Dominion Truck Co., South Street,

Kitchener, Ont., is having plans prepared by B. A. Jones, Ontario Street South, for addition to its plant to cost \$10,000.

Bids are being received by E. G. Patterson, superintendent Canadian General Electric Co., Peterborough, Ont., until Aug. 31 for the construction of a punch press building on Park Street, to be one story, 110 x 328 ft., steel and brick construction. Tenders for tools and equipment will be called later.

Plans are being prepared for the erection of a paper plant at Winnipeg, Man., by the Hinde & Dauch Paper Co., Toronto, Ont., to cost \$1,000,000. Company is looking for a suitable site. O. H. Moore, president and general manager, in confirming the report, said that nothing will be done in the line of construction work until spring.

Canadian Industries, Ltd., Toronto, Ont., is having plans prepared for the erection of a factory at Regina, Sask.

Pacific Coast

SAN FRANCISCO, Aug. 24.—Permission has been secured by Yuba River Power Co., 225 Bush Street, San Francisco, to proceed with hydroelectric power development on North and Middle Forks of Yuba River, consisting of five generating stations near Sierra City, near Downieville, near Ramshorn, Garden Valley and in vicinity of Narrows, to develop total capacity of 261,000 hp. Entire project is estimated to cost more than \$35,000,000, including transmission lines.

Fluid Packed Pump Co., Los Nietos, Cal., has plans for a new one-story machine shop at Norwalk and Puente Mills Roads, Santa Fe Springs district.

Baash-Ross Tool Co., 5512 South Boyle Avenue, Vernon, Cal., has awarded general contract to Modern Iron Works, 4850 Pacific Boulevard, for a one-story addition, to be equipped as a machine shop.

Northwest Lead Co., 1742 Fourth Avenue, South, Seattle, has awarded general contract to H. D. Stewart, 702 First Avenue, South, for one-story plant unit, reported to cost about \$25,000, with equipment.

Pacific Woodenware Co., Marysville, Wash., manufacturer of utensils, etc., is considering rebuilding of portion of plant destroyed by fire Aug. 15, with loss reported at \$70,000, including equipment.

Golden Gate Iron Works, San Francisco, recently organized by Charles S. Hoffman and L. W. Fleigner, plans operation of general iron-working plant at 1541 Howard Street.

United Engineering & Drydock Co., San Francisco, has concluded negotiations for purchase of shipbuilding and repair plant of Daniel J. Hanlon Co., Oakland, for reported consideration of \$750,000, and will operate new shipyard at that location. Extensions and improvements are planned, with installation of additional equipment. George Armes, head of purchasing company, was formerly chief engineer of Union Iron Works, San Francisco, acquired by Bethlehem Steel Co., Bethlehem, Pa., a few years ago.

Department of Public Utilities, Spokane, Wash., Charles Hedger, commissioner, is planning establishment of municipal airport, including hangars, repair and reconditioning shop, oil storage and distributing building, and other mechanical units, estimated to cost about \$75,000.

An appropriation in such amount is being arranged.

Board of Education, Los Angeles, has filed plans for one-story addition to vocational training shop at George Washington High School, Normandie Avenue, to cost more than \$50,000, with equipment. W. J. Dodd and William Richards, Architects Building, are architects.

Foreign

PROPOSITION is being considered by State Government, Melbourne, Australia, recommended by Victorian Electricity Commission, for construction of new steam-operated electric power plant at Yallourn, comprising three 25,000 kw. generating units and auxiliary equipment to cost more than \$9,000,000. Of this sum, power station machinery will represent about \$6,000,000, switch gear and accessories \$1,000,000, and transmission lines, \$1,500,000, remainder being used for miscellaneous work.

Company in Czechoslovakia is planning construction of new railroad line between Pilsen and Brunn, with locomotive terminals and repair shops, coaling stations and other facilities, to cost close to \$18,000,000. Information at office of Bureau of Foreign and Domestic Commerce, Washington, reference Czechoslovakia, No. 71567.

Victor Talking Machine Co., Camden, N. J., has approved plans for new branch plant at Sao Paulo, Brazil, to cost close to \$500,000, with equipment. Unit is scheduled to be ready for service early in coming year. A subsidiary interest

under name of Victor Talking Machine Co. of Brazil, Ltd., is being formed to carry out the project. Wilson R. Buie will be in charge of construction.

Following completion of new power plant at Congella, Durban, South Africa, with capacity of 36,000 kw., now in progress, Government of Union of South Africa, Durban, plans an early expansion in output in connection with proposed electrification of Government railways from Durban to Pietermaritzburg.

Municipal Government, Medellín, Colombia, has secured approval for a loan of \$13,000,000, a considerable portion of the fund to be used for purchase of materials and supplies for municipal public utilities, including the development of a hydroelectric power project at Guadalupe.

Government of Afghanistan, Cabul, is considering construction of railroad line from that city to Indian frontier, to include locomotive terminals and repair shops, coaling stations and other mechanical facilities. Surveys are projected at early date. Estimates of cost and preliminary details now under advisement.

Khimugol Syndicate (Chemical Coal Trust), Petrograd, Russia, has arranged an appropriation of \$8,800,000 for capital construction during coming fiscal year, fund to be used in part for construction of hydroelectric power plant at Don Basin, and glass manufacturing works. Information at office of American-Russian Chamber of Commerce, 145 West Fifty-seventh Street, New York.

Front of Factory Ornamented with Samples of Its Iron Work

THE entire front of the plant of the William E. McConologue Co., San Francisco, has been decorated with samples of the ornamental iron work built within the

plant. Window gratings are placed over the windows with wire screen, as shown to the right, while other samples are arranged on the remaining section of the building.

VOL. 122, No. 10

Fusion Welds on Heavy Plate

Swiss Firm Uses Oxy-Acetylene and Electric Welding on Important Pressure Vessels—Welders, Joints and Completed Work Tested Continuously

BY R. W. MILLER*

WELDING was introduced into the shops of Sulzer Brothers, Winterthur, Switzerland, at the beginning of the present century. This firm's main production has always been the construction of steam boilers, pressure vessels and sundry apparatus for the chemical and textile trades. Oxy-acetylene welding has changed the working practices to such an extent that numerous objects, some of them of very large size, are now constructed by welding instead of by riveting. Shop methods have not yet been fully developed, but to judge by the stage which both oxy-acetylene and arc welding have now reached, it would appear that they are bound to supplement rather than to compete with each other. On some work it is more advantageous to adopt one type of welding rather than the other; there are of course numerous other cases in which either method can be employed. One essential condition is that the design should be suitable for the chosen method of welding.

Types of Welding Equipment Installed

As to the equipment: Acetylene is made in a large carbide-to-water generator (as is usual in European practice) and, after passing through a purification plant, is piped to various outlets in the shops. Oxygen is piped through lines, leading from a manifold drawing a supply from a group of cylinders. About 35 welders are employed; blow-pipes are of the injector type. Fig. 1 shows the interior of one of the shops, and illustrates the first-rate working conditions.

Electric welding has been much more recently installed, and the equipment has been by no means standardized. Direct-current machines with constant voltage, supplying current to several workmen simultaneously, require a high investment in generators and series-resistances, and also are wasteful of energy. To avoid these drawbacks some individual motor-generator sets are installed. The most economical solution, so far as initial cost of plant and current consumption is concerned, appears to be in adopting

alternating current for welding. A single transformer is then sufficient for transforming the supply voltage down to the required welding voltage. Experience at the Sulzer plant indicates that direct-current welding is easier to learn, does not need such special welding wire and, in many places, is easier to carry out than alternating-current welding. On the other hand, the electric energy required for the latter is less.

Heavy Pipe Work Gas-Welded

Experience of 20 years indicates that oxy-acetylene welding is as yet unrivaled for making pipe connections. As an instance, Fig. 2 shows a steam-distributor which has 19 welded connections on the upper side alone. It was submitted to a test pressure of 350 lb. per sq. in. It can be seen that such work can be carried out so as to avoid any distortion.

Boilers with helical joints have often been built by Sulzer Brothers. By utilizing a helical weld, the circumferential stresses in the welded joint are reduced, and it is also possible to utilize the full length of the rolled plates, irrespective of the diameter of the boiler.

A large field for the use of oxy-acetylene welding is found also in the construction of piping and sundry other parts for pumping plants and hydroelectric power houses. Examples of this class of work are shown in Fig. 3 and Fig. 4. The former shows a part of the penstock for a Swiss hydroelectric plant. The longitudinal joints are welded with gas, the circumferential joints electrically. The flange rings are electrically welded internally and externally, and the arc is also used on the stiffening pieces. This is an example of the combination method often adopted. Fig. 4 shows a distributing piece before being fitted to the pipe line. Two hemispherical pieces were welded together in the middle and flanged out for the connections. These pieces successfully withstood a test pressure of 925 lb. per sq. in.

For such heavy plate, in either process of welding, the edges of the pieces to be joined together are beveled and the single Vee or double Vee thus formed is filled up with welding rod. This practice is quite similar to that observed

Fig. 4—Oxy-acetylene Welded Distributing Piece for Water Wheels. Tested to 925 lb. per sq. in.

*Witten, Ruhr, Germany.

Fig. 1—Oxy-Acetylene Welding on Heavy Plate Work in Sulzer Brothers Shops, Winterthür, Switzerland

Fig. 2—Steam Distributer with 68 Welded Joints. Tested to 350 lb. per sq. in. (at right)

in the United States. After the joint material has been deposited in this manner, it is similar in quality to cast steel of the same composition. In steel works this is improved by rolling or forging; and Sulzer Brothers obtain the same effect in their important gas-welded joints by hammering them when red hot. The edges are slightly bent inward, the joint is also slightly reinforced externally, and, as indicated in Fig. 5, the reinforced weld so obtained is practically symmetrical. Thus the joint is compensated amply for the lower strength of the welding material (because of its lower carbon content) as compared with the boiler plate used, which is of unusual quality. Careful annealing after welding is finished improves the microstructure of the metal at the union and, when properly carried out, eliminates any residual stresses due to the fabrication process.

Tests of Completed Work

Frequently a purchaser is disinclined to accept welded pipe or vessels, basing his refusal on the statement that it is impracticable to inspect the work after it is finished. It must be admitted that more dependence must frequently be put on the trustworthiness of the welders than on workmen engaged in most methods of construction. Furthermore, welding is often carried out by incompetent persons. From the failures which result, an observer who knows little about welding is inclined to blame the welding process itself instead of the persons using it. Only because of such circumstances and ideas can it be explained why

some clients must still be supplied with the more expensive hammer-welded joints, even when the tanks must merely be leak-proof and are not required to withstand pressure.

Boilers, high-pressure pipe lines and similar articles, when finished, are submitted to severe tests at pressures 50 to 100 per cent greater than the working pressure, during which time the welded joints are hammered. After this test both the inner and outer sides of all seams are inspected.

Quality is harder to judge when the arrangement of the weld is such that it cannot be stressed by ordinary test methods. Magnetic and electric tests have been tried by the Sulzer organization to determine the homogeneity of the weld in a finished piece of work, but none of these has as yet proved satisfactory. Testing by means of Roentgen rays has lately been introduced for laboratory study, but is still far from a shop method. It must be always remembered that the cross-section of a weld may vary considerably, with a corresponding variation in its transparency to the X-rays, so that the resulting photograph has light and dark tones even when there is no fault in the workmanship. Photographs must also be taken in a room lined with lead, in order to save the operators from the rays—conditions difficult to fulfill in workshop practice.

When manufacturing a large number of boilers, high-pressure pipe lines and similar articles, pieces are chosen at random and submitted to thorough tests until ruptured. Yet in a considerable number of cases it is possible to

make only a superficial examination of the weld. In a single Vee-joint, where the under side is easily accessible, an inspection can be made to see if the weld has been made right through. In a double Vee-joint (when the cross-section is X-shaped) this inspection must be done after the first side is finished. In electric welding, an opinion as to the quality of the weld is formed from the appearance of the surface of the joint, so long as the plates are not too thick, i.e., so long as only one layer of the welding wire is required.

Selection and Test of Welders

The more difficult it is to control a piece of welded work, the more necessary it is to exercise particular care in selecting the welders who are to carry it out. As much consideration should be given to their personal character as to their skill in welding. In the Sulzer works pieces are always taken from the work under construction and submitted to

thorough tests. In addition, a number of special test pieces are constantly welded, either to test the skill of a welder or to investigate a new welding wire or a new method of welding. On certain important contracts, full-sized sections of the work are constructed and their behavior is studied while being tested to rupture.

When pieces are cut with the weld extending across the middle and tested in tension, the figures obtained for elongation must be regarded with caution, since they are greatly affected by the position of the rupture—whether in the weld metal, immediately alongside, or some distance back from the joint. A much better idea of the qualities of the steel

Fig. 5 (Above)—Single Vee Weld Is Hammered Vigorously While Hot to Refine Grain and to Produce Slight Reinforcing Effect on Under Side

Fig. 3 (Below)—Penstock Piping for Swiss Hydro-Electric Project. Longitudinal seams oxy-acetylene welded; circumferential seams and bracing arc welded

Fig. 6 (at Right)—Test Pieces Cut from Electric Arc Weld-Metal in Heavy Plate. Cold bend on upper two. Hot bend on lower left. Tensile test on lower right

deposited in a joint can be obtained from test pieces made solely of the filling material. The preparation of such test pieces is, of course, rather an expensive operation and is representative of conditions only when welding very thick metal. Results of such studies are given in Table I. Typical test specimens are shown in Fig. 6. Although the test pieces are somewhat porous, the figures quoted for tensile strength and (with one exception) for elongation are fairly

Table I. Tension Tests of Electric Weld Metal

Electrode	Elastic Limit, Lb. per Sq. In.	Ultimate Strength, Lb. per Sq. In.	Elongation (a)
A.....	50,000	58,200	14.4
B.....	41,500	53,000	9.4
C.....	40,000	53,000	17.4
D.....	48,100	52,000	17.6
E.....		55,000	18.0

(a) Expressed as a percentage of the gage length, punch-marked half the usual length, i.e., one-half of 11.3 times the square root of the area of the bar.

uniform. Higher tensile strengths involve lesser elongations.

A more simple way of evaluating welded joints is by the bend test. The Swiss practice is to express the results in Tetmajer units, which vary directly with the thickness of the piece and inversely as the radius of curvature of the bend. The value of this bending unit is 100 when both ends lie flat on each other, and it is zero when rupture takes place without any permanent bending; thus the figures correspond to the percentage elongation of the outer fibers. Tetmajer bending units for gas and electric welds, as ordinarily encountered in Sulzer's production, are given in Table II.

Much importance is ascribed to the results of the deep etch on cross-sectioned welds, wherefrom the structure may be judged with the naked eye. Places not faultlessly joined together are very clearly recognized. Different tones at the joint are caused by variations in composition.

Oxy-Acetylene Welds More Closely Approximate Properties of Boiler Plate

A comparison is given in Table II between the tensile strengths of oxy-acetylene and of electrically welded joints. These tests were made in the Swiss Federal Testing Laboratories at Zurich. The gas welding was done by Sulzer Brothers, and the electric welding by a leading interest using electrodes of its own manufacture. From Table II it may be observed that the properties of the weld material taken from oxy-acetylene welds correspond more closely to those of the plate than in the case of electric welding.

Table II. Tests on Gas and Arc-Welded Joints

Material	Elastic Limit	Ultimate Strength	Contraction	Elongation	Tetmajer Bend
Oxy-acetylene weld	30,000	51,000	16.5	12.0	91
Oxy-acetylene weld	27,200	50,000	49.0	21.0	58
Arc weld	54,500	64,500	13.6	7.0	20
Arc weld	56,000	65,000	13.6	4.2	16
Unwelded plate	30,500	53,000		25.0	100

This also indicates the basis of use in the Sulzer Brothers' plant. When the finished work must be as uniform throughout as possible, oxy-acetylene welding is given the preference. If it is only desired that the weld should have a high elastic limit or high tensile strength without regard to toughness or ductility, electric welding is preferred.

New Determination of Austenite Boundaries

AREDETERMINATION of two important lines in the iron-carbon equilibrium system has been made by Prof. Honda and H. Endo of the Imperial Japanese Research Institute (147th report). Metal samples were packed in magnesia powder in a double-walled silica container, and heated in an atmosphere of nitrogen; microscopic investigation showed no decarburization under these conditions. As the temperature increased, determinations of the magnetic susceptibility were made at frequent intervals, and the results plotted, locating the point where fusion first starts (the "solidus") by breaks in the curve. *Arcm* was located

on a very slow cooling in a similar manner. The metal used was Swedish steel. Former investigations on steel synthesized with electrolytic iron and sugar carbon indicated that the minor impurities of Swedish steel do not appreciably affect the magnetic characteristics.

Results are shown in the figure. *Arcm* coincided with the curves determined by other authors using other methods, but no trace was found of the line *a-b'*, supposed to represent the solubility of graphite in austenite.

Quartz for Calibrating Pyrometers

Frederick Bates and Frances P. Phelps, physicists, Bureau of Standards, Washington, have studied the changes occurring in clear quartz at 573.3 deg. C. When cooling through this temperature the material changes its crystal lattice with liberation of so much heat that it can be used as a fixed point in pyrometer calibration.

In the present temperature scale there are six reference points covering the range from liquid oxygen to the freezing point of gold. The region from steam, 100 deg. C., to silver, 960.5 deg. C., is covered by sulphur, 444.60 deg., and antimony, 630.5 deg. The temperature of quartz inversion (573.3 deg. C.) comes between the boiling point of sulphur and the melting point of antimony. In view of the many advantages connected with the quartz inversion for temperature scale purposes, the authors propose abandoning the antimony point.

Use of quartz is the most convenient and simple method for the calibration and control of thermocouples in the average laboratory. It is sufficient to select a small piece of clear crystalline quartz and if not convenient to drill a small hole for the insertion of the thermocouple, merely place it in contact with the quartz. The investigation is covered in scientific paper No. 557 of the bureau.

Borders of Austenite Region in Iron-Carbon Equilibrium Diagram, as Determined by Various Investigators

Steering Gear Plant Arranged for Economical Operation

*Production Lines Start at Raw
Material Receiving Bay and
Extend to Assembly Conveyor
—Assembly Progressive*

MARKED economies in handling raw material and in moving work in process have been effected in the new plant of the Gemmer Mfg. Co., Detroit, maker of automobile steering gears. Production has been speeded up, manufacturing costs have been lowered and a more uniform product is obtained. All these gains are attributed to the convenient arrangement of the plant, which, with no other products than steering gears, is a highly specialized one.

Near the center of the plant there is a 50 x 500-ft. receiving bay with monitor-type roof, served by an overhead electric traveling crane. There is room for spotting 10 cars of stock on the track in this bay. Each car is delivered to a point adjoining the department in which the material is to be used. After being unloaded, the material is inspected and placed at the end of the production line along which it is to be processed. There is ample space between

the unloading track and the production lines for the storage of sufficient raw stock to insure lines of material at all times.

Plant Laid Out for 5000 Units a Day

A brief description of the plant layout will make clear the routing of material in process. The production lines are at right angles to the receiving bay, and all are located

The Method of Handling Raw Material Is Unusually Convenient and to a Large Extent Eliminates Trucking. From the railroad cars on the track at the side of the receiving bay, the stock is placed at the head of the production line along which it is to be processed. The production lines are at the right

In the Section of the Assembly Line Shown at the Top of the Page, the Steering Gears Are Adjusted and Inspected. The parts are stored in the racks at the left, which are covered to keep out the dust

at one side of that bay. These lines extend to the side of the plant and terminate adjoining an assembly conveyor, which travels along the outer wall. Progressive assembly on the conveyor is a feature of the plant, which is laid out for a daily production of 5000 steering gears and is equipped at present for a daily output of 4000 units. The latter rate of production has been attained for extended periods.

Each production department has from two to nine lines of machines, which are practically duplicates, and open spaces are left between the lines in each department for the placing of additional machine lines, which will permit an increase of capacity. The lines are so arranged and equipped that it takes approximately 95 min. for a part, except one that is heat treated, to go from first operation until it is ready for assembly. Inspectors are placed along the lines to inspect parts between operations; they also inspect the first pieces that come from the machines when the drills, reamers, taps or other tools employed are sharpened or changed. All pieces are checked for count and inspected for quality at the end of the production line before being washed. The departments and production lines are arranged according to sequence of operations, so that completed parts of the

made up principally of a worm, shaft, column, jacket, housing, cover, adjusting nut and control.

The heat-treating department is located in the center of the plant adjacent to the departments that make parts requiring heat treatment. There are two 75-kw. electric heat-treating furnaces for normalizing and annealing operations. These were built by the George J. Hagan Co. and are equipped with automatic heat control and temperature registering instruments. They are used mostly for heat-treating shafts and ball arms. The furnaces can be adjusted for any heat or cycle of time. They are also equipped with automatic dumping mechanism, which dumps the work through a water-sealed chute into a water quenching tank, from which a power driven conveyor carries the parts.

Carburizing is done in one 280-kw. capacity Hagan counterflow regenerative type furnace, which is 18 ft. wide and 51 ft. long. Loaded pots are charged into each end alternately by means of a motor-operated pusher. A temperature of 1650 deg. Fahr. is maintained in the heating zone, and the material is kept in the furnace an approximate time cycle of 18 hr. Control of the furnace is entirely automatic and the doors are automatically operated. The time cycle is regulated by a clock. On leaving the furnace the car-

Parts Are Heat Treated in Two Rotary-Hearth Electric Furnaces from Which the Work Is Dumped Automatically into a Quenching Tank

steering gears reach the point adjoining the assembly line where they are needed for the assembly operations.

Stock such as rough castings and some forgings, although most of the latter are produced in the plant, are placed in steel boxes 36 x 48 in. x 30 in. high. The boxes are handled in the receiving bay by the overhead crane, and space is conserved by stacking loaded boxes one on top of another. Trucking in the plant has been very largely eliminated, no material in rough stock or in process, except parts that require heat treating, being trucked. Parts to be heat treated are carried to the furnaces on racks.

Cars Held in Receiving Bay for Disposal of Scrap

The receiving bay with its railroad track also serves as a loading bay for turnings. An open top car is spotted at the end of the track and remains there until it is filled, usually about two days, thus serving as a storage bin. The scrap in the form of turnings is put in standard scrap boxes, 6 ft. long and 3 ft. deep, which are set alongside each machine in the worm department and at the turning lathes in the shaft department. When the boxes are filled, the overhead crane dumps the scrap into the railroad car.

There is a production department devoted exclusively to the manufacture of each part of the steering gear, which is

burizing boxes are conveyed by an overhead hoist to a roller conveyor at the side of the furnace and from this conveyor the carburizing compound is dumped through a grate. The work remains on the grate and the compound is drawn by suction up through a cleaner to a storage space, from which it is fed by gravity to the point where the pots are loaded.

All carburized work is hardened in two rotating-hearth gas-fired furnaces having electric control.

The usual routing of the shafts is through the normalizing furnace, to prepare the steel for machining, and then through the production line. They are then returned to the heat-treating department for carburizing and hardening. After quenching, following hardening, parts go to lead pots for drawing when this is required. They are then returned to the process departments for finishing operations. Practically all operations except finish grinding on the shafts are done before carburizing. The ball arms are heat-treated but not carburized.

Electrically Heated Continuous Enameling Oven a Feature

Finishing the column cover or jacket is an important step in the manufacture of the unit, as the finished appearance of the column must be in keeping with the finish of

the car on which the steering gear is to be used. The jackets are sawed to length from steel tubing, burred at both ends, given the additional operations that are required on some types and then transported on a gravity conveyor to a continuous enameling oven. This is a conveyor-type electrically heated oven, electrically controlled and has several interesting features. The oven is in the form of an inverted "U," occupying a floor space of only 8 x 15 ft.

of 70 deg. to the oven, where it is baked for 45 min. at a temperature of 500 deg. Fahr. The entire time cycle is 90 min. Approximately 1800 jackets are on the conveyor at one time. The dipping tank and oven are entirely inclosed and, in having the work enter and come out perfectly dry, the necessity of a dust-proof room is eliminated.

With more uniform dip, drip and heat secured from the continuous enameling unit, the work comes out with a uni-

THE Double Chamber Electric Carburizing Furnace Is Shown Above. On leaving the furnace the carburizing pots are placed on the roller conveyor at the side and the compound dumped through a grate

Steering Column Covers Are Enamelled and Baked in the Continuous Type Electric Oven Shown at the Right. The oven is vertical and occupies small floor space. The work is suspended on racks and carried through a dip coating tank and the baking section of the oven

The top is insulated with a 4-in. layer of rock wool. The heat flows in a direction counter to the direction of the work. The finished work is cooled by intake air and the incoming work is preheated by what otherwise would be waste heat. Baking heat is reached at the apex of the "U." Fumes are drawn off by a small fan.

The jackets are suspended from racks on hooks attached to a small handling hole at the end of the jacket. One man feeds the work to the conveyor. It goes through the dipping tank, drains 20 min. and is then carried up at an angle

form finish, and it is stated that rejections have been practically eliminated. The oven was designed and built by the Kirk & Blum Mfg. Co., Cincinnati, and the conveyor and structural steel by the Mechanical Handling Systems, Detroit.

Assembly Is Progressive

The assembly line along the side wall extends the greater part of the length of the plant. Finished steering columns are placed on rollways, from which they pass to an endless

chain conveyor, 230 ft. long and 18 in. wide, along which the column is assembled. Machines for certain work required in assembling are located at the side of the conveyor. The column is placed on a rotating fixture for making the worm thrust adjustment.

The assembled column on leaving the first conveyor is greased in the open housing and then placed on a plate conveyor having special holding fixtures on 30-in. centers. On this the shaft and cover and minor parts used in adjusting the gear are assembled. Then the unit is taken from the conveyor to adjoining individual vises for adjustment and inspection. After inspection the uncompleted assembly goes back to the conveyor line and additional minor parts are added to complete the unit.

At the end of the second conveyor the steering gear is dip-painted and placed on a third conveyor, which is of sufficient length to allow it to become dry. From this conveyor the gears are put on standard racks, 100 to a rack,

on which they are carried to the shipping room, located a short distance below the assembly line. They are delivered to Detroit customers in these racks. Controls, ball arms, jackets and some miscellaneous parts that are not assembled until the gear is placed on an automobile are inspected after the finishing operations, boxed and shipped separately from the gear assembly. These go from a point near the end of the assembly line to the shipping department, which is equipped with a depressed track for carload shipments and a depressed driveway for local deliveries.

Extreme care is exercised in cleaning finished parts and in keeping them clean before assembling. At the end of each department is a washing machine in which the parts are cleaned after final operations. Shafts are washed before heat treatment and washed and oiled after finishing operations. The main parts of the gear are placed in covered racks at the side of the assembly line after cleaning in order to keep them free from dust.

Aluminum Alloy Replaces Steel Castings on Field Gun Mounts

AT the spring meeting of the American Society of Mechanical Engineers, held in May at Pittsburgh, F. M. Brauer of the Watertown Arsenal announced that heat-treated aluminum alloys were being installed in anti-aircraft mounts.

Alloy No. 195 Heat Treated

"Three or four months ago," Mr. Brauer said, "the Ordnance Department found a metal that was light, yet with physical properties that would permit its use in mobile anti-aircraft mounts. After spending considerable time in investigations, analyzing numerous tests, and consulting engineers and other experts, a metal having specifications known as No. 195, heat treatment No. 4, was found, which with but a few modifications would be adaptable. Six per cent elongation, 13,000 lb. per sq. in. yield point with 28,000 lb. per sq. in. ultimate strength, was established. Further than that, an order was placed for this metal to be used in very important components of gun carriages.

"It may appear singular that the department should introduce a metal of this kind and put it into a gun carriage; however, there was no hesitancy in so doing, and we are firmly convinced that not only these components, but also in the near future other parts, will be changed over from cast steel having a 30,000-lb. yield point and 70,000-lb. ultimate strength to aluminum-alloy casting No. 195. Not only are specifications as to physical properties carefully checked, but also an actual test is made and each member subjected to a load equal to that which will produce a fiber stress of 80 per cent of the strength of the metal at the yield point."

From a paper presented at the same meeting by Messrs.

Templin, Broglio and Marsh of the Aluminum Co. of America, the analysis of this alloy is as follows:

Silicon	0.75 per cent
Iron	0.57 per cent
Copper	4.40 per cent
Manganese	0.02 per cent
Zinc	0.25 per cent
Aluminum	94.01 per cent (by difference)

Properties developed by this alloy after heat treatment and upon being tested at room temperatures and at elevated

Alloy No. 195 Heat Treated and Aged

temperatures are given in the curves. Heat treatment was not specified. Aging consisted of holding one week at 400 deg. Fahr.

Studies on Migration in Industry

Taking a quarter-century range, a study of the wage earners in manufactures in the United States, made by George D. Ogden, traffic manager Pennsylvania Railroad, showed gains in numbers in all nine of the sections of the United States. These gains, however, varied markedly between sections. New England gained only 32 per cent and the Middle Atlantic States 55 per cent, compared with 237 per cent for the Pacific group and 118 per cent for the East North Central States. Rapidly increasing total population in the Pacific States accounted for much of the gain in that area. In numbers its advance was scarcely greater than in New England, despite the sharp disparity in percentage of gain.

Increasing the Utility of the Bend Test

Rapid, Accurate and Consistent Quantitative Results Are Obtained by
Measuring Extension of Outer Fibers at Failure
by New Bend Extensometer

BY A. B. KINZEL*

PHYSICAL testing of iron probably dates back to the discovery of processes for making the material, and it may be imagined that the first test at the disposal of the smelter man was the bend test. The use of the bend test is still universal and no doubt each of us has at some

ance, the bend test has probably received less careful thought from metallurgists and engineers than any of the other tests, and these facts warranted the development of a method for quantitative evaluation¹ and a study of the various factors involved.

Angle of Bend Not a True Measure of Ductility

The original method of making a bend test was simply to bend the piece and note the angle of bend. This of course varied considerably with the thickness of the piece and the tendency to bend locally, allowance being made for this in the mind of the investigator. However, no accurate evaluation was attempted. The next step in bend testing was to adopt a standard radius about which to bend the piece and again note the angle of bend. This is illustrated by two of the methods of bend testing used today, namely, forcing the piece between two fixed parallels by means of a tup with a given radius (Fig. 1) and wiping the piece around a pin of a given diameter (Fig. 2).

One great objection to these tests is that they do not give comparative results, simply because the material does not hug the tup or the pin. The reason for this is that,

Fig. 1—American Welding Society Standard Bending Fixture Mounted in Tension Testing Machine

time or other seen a blacksmith or mechanic bend a piece of iron or steel to find out whether it was "tough." In the field of engineering the test is also of considerable use and practically all specifications for flange plate, rivets, and medium-carbon steels, contain a bend test. Moreover, due to the ease of performance, this test is generally carried out by the consumer as well as by the manufacturer.

However, the fact that the test has not been quantitative has probably restricted its further use. It has long been recognized that the bend test gives information which is not obtained from the tensile test, because the bend test measures the ductility of the material under two-dimensional stress. But as usually carried out, consistent results are difficult to obtain and no satisfactory method of quantitative evaluation of the performance of the material has been developed. In spite of its age and ease of perform-

T is stationary table.

F, F are fixed blocks on table.

W is wedge for holding specimen.

M is movable block rotating about *P*.

P is a fixed pin.

Fig. 3—Rapid Local Elongation Kinks Specimen Away from Pin

as the fibers under greatest stress reach the yield point, they elongate or compress very rapidly without any further increase in stress and the piece bends locally or kinks, leaving the pin or tup, as indicated in Fig. 3. Moreover, there are additional strains introduced by the tup or pin which probably affect the results, although generally this

*Union Carbide & Carbon Research Laboratories, Long Island City, N. Y. Chairman, American Society for Testing Materials, sectional committee on bend testing.

¹Critical Study of the Bend Test as Applied to Iron and Steel, by A. B. Kinzel. *Journal, American Society for Steel Treating*, November, 1927, page 778.

effect is not serious. The measure of the performance—i.e., the angle of bend—is a function of both the local effect at the kink and the progressive bending at either side of it.

Stresses occurring on bending a piece are indicated graphically in Fig. 4. Compression takes place on the inside and tension on the outside of the bend, and final failure occurs when the outside fibers are stretched to their limit. No measure is made of the actual force necessary to do this, so that obviously the bend test is a measure of ductility only, and not of strength in any sense. Moreover, as the final breaking point is determined by the ductility or elongation of the outside fibers, this factor, namely, the percentage elongation of the outside fibers, is the logical measure of the performance on bending. By bending the piece in a vise or other suitable press, all external stresses except the direct bending moments are constant. In such an event, the piece takes its own free bend and finally breaks at a definite outside fiber elongation. By evaluating this fiber elongation, a quantitative measure of the bend performance of the piece is obtained. This evaluation may be affected by direct measurement or by measurement of the radius of curvature and computation.

Method of Bending in a Vise

Even large bars may be readily bent in the manner outlined above by first kinking the ends and then placing the specimen in a vise or press. Such a test gives information on the limit of fiber elongation of the material. This is an absolute figure and is independent of the thickness of

Fig. 4—Graphical Representation of Stress Distribution Across a Bent Bar

the piece when the specimen tested is at least three times as wide as it is thick. (This minimum width is necessary to eliminate the edge effect and to bring into play the full two-dimensional stress.) In certain bars—particularly of round rods—it is not practical to have the required widths. Such a specimen may be bent and the test applied in exactly the same way, but the results will be comparative rather than absolute.

It might appear on first thought that there would be some difficulty in noting when the incipient failure takes place. Actually there is no difficulty, for the failure takes place in shear across the outside plane and at the instant of failure a decided slip occurs which is readily visible. A few tests will suffice to show the ease of determining this point.

From the foregoing it is obvious that certain precautions in the actual performance of the bend test are advisable. First, the piece to be bent should be at least three times as wide as it is thick, as remarked above. Second, in bending the piece care should be taken to avoid tensile forces. It is recommended that the piece be bent in a vise or press, although the use of the usual wiping machine or tup should be satisfactory provided the fiber elongation is measured to evaluate the performance of the piece.

In the direct measurement of fiber elongation, a given gage length is laid off on the specimen so as to include the final point of fracture. The piece is bent and the length

at which the material first shows signs of incipient fracture is measured. The ratio of the increase in length to the original length is the percentage fiber elongation.

This method is open to the objection that it measures the average elongation over the gage length chosen, rather than the actual elongation at the point of failure. Due to the nature of the bending moments, which increase as the central point of the bend or point of failure is approached, there is often a decided discrepancy between the local and the average values. Moreover, the gage marks are apt to affect the results, although with care this can be avoided.

Direct Reading Bend Extensometer

The author has developed a bend extensometer for the rapid evaluation of tests, shown in Fig. 5. It consists essentially of two fixed points with a movable point between them. The movable point actuates a needle, the position of which may be read on the dial. By simply applying the fixed points to the outside surface of the bent specimen, as shown, a reading is obtained on the outside scale of the dial. This reading multiplied by the thickness of the piece and converted from the inside to the outside scale gives the percentage fiber elongation of the specimen at the place where the instrument is applied. For example, in the photograph the dial reads 45, the bent specimen being $\frac{7}{8}$ in. thick. The product of 45 and $\frac{7}{8}$ gives 39, and 39 on the inside dial is opposite 65 or 66 on the outside dial. Thus, there is 65 or 66 per cent elongation on the outside fiber of the specimen.

The instrument may be used regardless of the degree of curvature, within practical limits, as is demonstrated in the mathematics given in the appendix. However, it should not be applied to ductile sheet or to material which causes the needle to rotate more than one revolution on the dial, because the approximations involved in the derived formula are then not sufficiently accurate. In general, an accuracy of better than 5 per cent of the final figure is obtained when using the extensometer. This has been checked against carefully measured short-gage lengths on a number of specimens.

It may appear that the bend extensometer is open to the same objection as the use of a fixed gage length. This is not true for two reasons. First, the gage length used may be made very much shorter than would be practical

Fig. 5—Extensometer for Direct Reading Stretch at Outside of Bent Specimen

in direct measurements (0.322 in. for the present instrument), and second, by moving the points along the arc, the rate of change of the radius may be noted and the exact

radius at the point of failure obtained by extrapolation. However, the latter method is usually not necessary, as the gage length on the meter is so short that it gives satisfactory practical results. It may be made shorter if occasion demands.

A number of tests have been made with the bend extensometer and it has been found to give consistent, accurate results. For a comprehensive discussion of the bend testing of welds, the reader is referred to a paper by W. B. Miller.³ The test has been applied to various types of steels

³Bend Test as Applied to Welds, by W. B. Miller. *Journal, American Welding Society*, September, 1927.

with a wide range of thicknesses and of characteristics. The following list gives some of the results obtained:

Material	Per Cent Bend Elongation
Cast iron	0.2
Structural plate.....	23
3 per cent nickel steel plate.....	29
Boiler plate	100
Chrome-vanadium bar (hard).....	10
Chrome-vanadium bar.....	31

Introduction of a quantitative evaluation of bend performance, together with an easy method of obtaining this figure, should give impetus to the use of the bend test, particularly in cases where ductility is an important factor.

Supplement Giving Mathematical Basis of Dial Graduation

IN evaluating fiber elongation from a measurement of the radius of curvature it is necessary to consider the geometry of the bent specimen. In Fig. 6 a longitudinal cross-section of a bend is shown. It is apparent that the fiber elongation is $\Delta L \div L$. From the similar triangles in the figure,

$$\frac{\Delta L}{L} = \frac{\frac{t}{2}}{R - \frac{t}{2}}$$

from which it may be deduced that e , the ratio of elongation to unit length, is equal to $t \div (2R - t)$. In cases where the bar is bent almost completely upon itself, a shift of the neutral axis occurs from the center of gravity toward the inside surface.

This modifies the above formula, but in most cases this modification may be neglected. (For a discussion of this point, those interested are referred to the author's previously mentioned study.¹) Thus, by measuring the thickness of the piece and the radius of curvature of the outside surface at the point of failure, the elongation may be evaluated. The measurement of the radius of curvature presents some difficulties. It may be accomplished by tracing the arc and applying compasses to the section under discussion or by constructing a circle to match the arc in the usual geometric way. Both methods are comparatively laborious.

The bend extensometer is based on the principle of the usual dioptometer, used by oculists to measure curvature

on lenses. The motion of the central point measures the distance from the top of the arc to the chord between the fixed points. The functional relation between the radius of curvature of an arc, its chord and the maximum normal distance from the chord to the arc, is given in the following equation:

$$H = \frac{1}{2R} \left(\frac{C^2}{4} + H^2 \right)$$

where H is the distance from chord to arc, C is the length of the chord, and R is the radius of curvature.

The meter is so constructed that H is always very small compared with C , so that the term H^2 is of minor importance. C , the chord length or distance between the outside points, is 0.322 in., so that for practical purposes H^2 may be dropped when the

Fig. 6—Longitudinal Section of Bent Bar

Fig. 7 (Above)—Chart to Convert Middle Ordinates (Dial Readings) into Fiber Elongations

Fig. 8 (At Left)—Nomographic Chart for Any Plate Thickness. Method of use: Rule a straight line corresponding with the required thickness. From the dial reading at hand go up to the thickness line, then across to the $t = 1$ line, then up to the e line, then across to the left-hand scale for percentage elongation

¹See footnote 1, page 575.

radius of curvature is $\frac{1}{2}$ in. or greater, and the formula becomes

$$\frac{1}{2R} = \frac{4H}{C^2}$$

In very sharp bends where the radius is less than $\frac{1}{2}$ -in. the correction should be applied or another bend extensometer should be used in which the distance between the fixed points is less than on the present* meter. This will apply only to thin material with high ductility.

If the fiber elongation, based on the final length rather than the original length, be designated as F , then from Fig. 6, the relation

$$F = \frac{100 \Delta L}{L + \Delta L}$$

ensues, and from the above formula

$$F = \frac{400 HT}{C^2}$$

The factor 100 is introduced for a percentage basis. The dial of the meter is so calibrated that the factor

$400 H \div C^2$ is read directly. It will be seen from Fig. 6, that there is a definite relation between F and e , the true fiber elongation, the relation being $e = F \div (1 - F)$. As has been shown, F is the dial reading times the thickness of the piece and the value of e may then be obtained by this equation.

In order to simplify this process for actual use, the writer has prepared Fig. 7. By simply obtaining the dial reading of the bend extensometer on the bent specimen, the fiber elongation may be read from the curve on the chart corresponding to the thickness of the specimen at hand. The curves are given for usual thicknesses. However, it is conceivable that some particular thickness may be desired, for example, a shop testing $13/32$ -in. plate regularly would need the corresponding curve. The following shows how the curve may be graphically obtained.

In the nomographic chart (Fig. 8), going from the dial leading to the straight line corresponding to the thickness automatically performs the multiplication, so that a value for F results. Now the correction factor from F to e for any given value of F is independent of the thickness, so that by adding the requisite amount in any case, the final value of e is obtained. Thus, the chart would be used as noted in the caption. By doing this for a number of dial readings, a special curve may be readily plotted.

In special cases where a great deal of work is being done with one thickness of material, a special dial for that thickness may be easily constructed by changing the figures on the dial to correspond with the percentage fiber elongation, as shown by the curve just indicated. The bend extensometer scales have been so worked out that all charts are eliminated for usual conditions.

To Standardize Finished Bars and Shafts

Several new standardization projects have been proposed to the American Engineering Standards Committee, including bars, shafts, studs and gages. The American Society of Mechanical Engineers has become sponsor for these four projects. Comments or requests for information should be sent to the first-mentioned organization at 29 West Thirty-ninth Street, New York.

In developing standards for iron and steel bars the following items would be considered: stock sizes, shapes and lengths for iron and steel bars, including flats, squares, rounds and other shapes. The standardization of Woodruff keys, a project now under way under American Engineering Standards Committee auspices, has convinced that body of the necessity of standardizing the sizes and shapes of iron and steel bars, particularly with reference to the dimensions and tolerances of hot and cold-finished bars.

Under the subject of splined shafts and splines, it is recommended that a study be made of the relations between keys and shafting of various kinds; square and flat keys, both parallel and taper; splines and double keys. Both solid and hollow shafting would be considered.

Standardization of dimensions of stud bolts, including thread dimensions and working tolerances, is also contemplated.

A matter of some interest to the metal fabrication industries is a project for organizing a committee of technical experts to undertake the work of gage standardization. It is expected that the work will benefit manufacturers and purchasers of gages by replacing the great number of sizes and types now being manufactured by a comparatively small number of sizes and types. The United States Navy has done much

important work in establishing gage standards for naval use, and several private concerns, such as the Firestone Tire & Rubber Co., the General Electric Co. and the Pennsylvania Railroad, have established specifications. These and other specifications will be studied and coordinated in a national way.

Gray Iron Institute Makes Cleveland Its Headquarters

The Gray Iron Institute, recently organized, has established permanent headquarters in the Terminal Tower Building, Cleveland. An announcement issued by Arthur J. Tuscany, manager of the institute, stated that the executive committee had picked Cleveland as its headquarters because of its central location, making it possible to reach overnight from that city most of the important foundry centers of the country. The Terminal Tower Building adjoins the site of the new Union Station that is now being erected in Cleveland. Details of the organization of the institute and its objects were printed in THE IRON AGE May 24, 1928, page 1476.

Booklet on Iron Ore

Considerable statistical and other data on the Lake Superior iron ore industry is included in an annual booklet issued by the Lake Superior Iron Ore Association, Union Trust Building, Cleveland. The mining companies, the mines they operate and their sales agents are listed; as well as the individual mines grouped by ranges and their shipments for the past 10 years. Total annual shipments are given by ranges for 20 years. Included also are receipts at Lake Erie ports, shipments from mines in other States outside of the Lake Superior district and imports by countries.

Program of Metals Section of Safety Council

Industrial safety in steel plants will receive particular emphasis at a meeting of the metals section of the National Safety Council to be held in New York, Oct. 1 to 5. A review of accidents and progress in the steel industry will be given by Dr. L. W. Chaney, Bureau of Labor Statistics, Department of Commerce. J. A. Voss, safety director Central Alloy Steel Corporation, Canton, Ohio, and Mike Grady, president Stark County, Ohio, Foremen's Club will debate on the subject, "The Foreman Is Responsible for the Accidents That Occur in His Department." The debate will be followed by presentation of slides by John A. Oartel, chief of the safety bureau, Carnegie Steel Co., Pittsburgh.

"The Placement of Men, or What the Surgeon Can Do," will be the subject of a paper by Dr. A. W. Colcord, plant surgeon Clairton works, Carnegie Steel Co., and further information derived from experience in the steel plant will be offered in an address on "Safety from the Viewpoint of Supervision," by Dominic Samuels, foreman Youngstown Sheet & Tube Co., Youngstown.

R. M. Roosevelt, vice-president Eagle-Picher Lead Co., New York, will talk on "Safety from the Viewpoint of Management," and accident prevention in the foundry will be taken up in a paper on "Correction of Unsafe Practices in Foundries," by Nelson H. Kyser, safety engineer Studebaker Corporation, South Bend, Ind., and in another paper on "Developing a Safe Human Factor in Our Industries," by L. A. Hartley, director of the educational department, National Founders Association, Chicago.

A new 13-in. skelp mill to be installed at the National works, National Tube Co., McKeesport, Pa., is to be a four-high roller-bearing mill.

Automatic Furnace Control for Hardening

Rotating Hearth With Speed Varied to Suit Requirements—Gas Fuel Used for Two Heating Zones

UNIFORMITY in hardening gears and pinions has been obtained by the Automotive Gear Works, Inc., Richmond, Ind., by the installation in its heat-treating department of a gas-fired rotary furnace (by Holcroft & Co., Detroit) capable of handling 900 lb. an hour. The furnace has two heating zones the temperatures of which are held within plus or minus 10 deg. Fahr. by means of a Leeds & Northrup automatic recorder controller and a Dixon control valve.

Heat is supplied by 10 McKee burners spaced at 2 ft. 10 in. apart. In addition there are two manifolds, one for each zone. Three outer flues located 35 deg. apart have been provided. The hearth is of nickel chrome alloy, the inside diameter measuring 4 ft. It is of the revolving type and is operated by a ½-hp. 3-phase 60-cycle motor running at 1200 r.p.m. and equipped with a Reeves variable speed transmission. The time required for a complete revolution of the hearth ranges from 20 min. to 2 hr. The hearth pan is made of cast iron and has bearing brackets.

On a structural steel base, the fur-

nace is lined with 4½ in. of firebrick, which is reinforced with 4½ in. of insulating calcined brick and 8 in. of natural brick. A steel plate casing ¼ in. thick forms the exterior shell. The furnace is sand-sealed to

prevent infiltration of air into it. Since a reducing atmosphere can be maintained at all times by the use of gas, the gears and pinions are free from scale when they are removed from the hearth.

To maintain the temperature within the furnace at 1600 deg. Fahr., 1.2 cu. ft. of 570 B.t.u gas suffices for each pound of work. Equipment includes an Ingersoll-Rand vertical reciprocating gas compressor with a

cylinder 8 in. in diameter, operating at 375 r.p.m. The compressor produces 2820 cu. ft. of gas an hour, delivered at 10 lb. pressure.

Tinting Metal Fence Beautifies Fountain Setting

The coloring or tinting of exterior metal work has been carried out successfully on the heavy rod fence which surrounds the Buckingham Memorial Fountain in Chicago. Interior metal work has long been colored to harmonize with its surroundings, and to effect the desired color the fence was built of copperweld rod. This is a steel cored metal having a heavy layer of pure copper molten welded to it in the original ingot. A special solution was applied by brush, and successive applications were made until the desired tint was reached and the greenish color has become a part of the copper, with no tendency to flake or scale.

Half Section Through the Furnace Vertically (Right) Shows Support and Rotating Elements of the Rotating Hearth. At A is shown the relative location of one of the gas burners. The horizontal section (left) gives details of the great speed reduction from 1200 r.p.m. in the motor to 1 revolution in 143 min. Insulation and firebrick are shown sectioned. Reproduction of the photograph shows gears being fed into the furnace for hardening

New Vertical Spindle Miller

A NO. 2 vertical spindle unit has been added to the "standard" milling machine line of the Brown & Sharpe Mfg. Co., Providence. The machine is intended for both produc-

tion and tool-room work. It is all-gear driven, with anti-friction bearings from the driving pulley to the spindle and in the feed and power fast travel mechanisms. Two operating positions are provided, one at the

*Automatic
Disengage-
ment of the
Power Fast
Travel with
Engagement
of Feed Is a
Feature*

front and one at the rear of the table, with all control levers readily available from either position. Dual control is provided for feed changes and speed changes in two series are ob-

tained by means of a single lever at the side of the machine. The rates of feed or speed for which the machine is set are indicated by direct reading dials located above the control levers. Power fast travel for

longitudinal, transverse and vertical movements, operated by a single lever, is provided.

Automatic disengagement of the power fast travel with simultaneous engagement of the cutting feed, without attention on the part of the operator, is feature emphasized as making possible considerable saving in operator's time in that the work can be run up to a point close to the cutters before the cutting feed is engaged. It also prevents injury to the work and cutters through accidentally jamming the work into cutters. After the fast travel is engaged and until the cut is completed the operator is free to attend another machine.

Automatic lubrication with filtered oil is provided for all mechanisms within the column and for the driving pulley, oiling of the knee assembly being also automatic by means of a separate pump in the knee. A single oil well lubricates the saddle and table bearings. The knee elevating screw is one piece and does not extend below the base of the machine.

An automatic feed, which can be readily controlled from either operating position and has automatic release at any point, is provided for the spindle. The spindle has a telescoping guard and the spindle head is counterbalanced and has a micrometer stop for controlling the depth of cut. The machine is available either as belt drive, fitted for motor, or equipped with motor. When motor driven, the motor is located in a ventilated compartment in the base and drives by chain and sprocket.

Portable Band-Saw for Material Up to 7 In.

THE De Walt Products Co., Leola, Pa., has brought out the band-saw here illustrated, which is designed to provide in a portable machine the power and capacity of a stationary production band-saw. Although intended for use as an individual motor-driven unit with floor stand, the machine may be used independently of the floor stand and motor. It can be employed in connection with the company's Wonder Worker woodworking machine simply by attaching the pulley to the arbor of the Wonder Worker and swinging the arm to the rear. By replacing the V-drive pulley of the band-saw with a flat pulley, the band-saw may be driven from a line-shaft.

The capacity of the band-saw is for material 7 in. in thickness. The base of the machine carries the head casting within which is contained three tracking pulleys and the saw blade. The pulleys are of aluminum and are ball-bearing mounted. It is pointed out that the use of three tracking pulleys instead of two large pulleys to separate the two sections of a revolving saw blade has made it possible

to design a compact machine with 20-in. throat clearance between the saw blade and the frame. The saw

blade is entirely inclosed by the one hinged cover, except for 8 in. at the cutting point.

Features include a compact roller saw guide which is adjustable for various thicknesses of material up to 7 in. The table of the machine is 13½ in. square and is arranged so that it may be tilted 45 deg. to the right and 30 deg. to the left, the positioning of the table being indicated on a dial which is graduated in degrees. A stop is also provided so that the table may be brought rapidly to the exact horizontal position. The machine is driven by a ½-hp. motor through a V-belt. The weight of the machine with floor stand, complete, is 210 lb. Without the motor and floor stand the weight is 120 lb.

Substantial improvements in the plant of the Globe Steel Tubes Co., Milwaukee, are reported by the company. One tube rolling mill unit is being replaced and modern machines are being installed for piercing, rolling and reducing, all having electric drives. This involves additions to the electric power plant and some building changes.

Special Machine for Drilling and Spot-Facing Implement Parts

THE drilling and spot-facing of four holes of the same size in seven different malleable castings is accomplished on the machine illustrated which was built recently by the Millholland Sales & Engineering Co.,

not only work of seven different sizes, but on one end of each piece two holes intersect at an angle of 45 deg., and some of the "Ys" so formed were left-hand and some were right-hand. The parts also varied in length

to a swivel plate which carried the "Y" bushing block and quick-acting work clamp. By swiveling the plate carrying the two saddles and bushing block, either right or left-hand "Y" ends can be machined. To compensate for variations in length of work the swivel plate is mounted on a false table which is located on the centerline by means of a large key sliding in a keyway cut in the bed proper. This false table is adjusted in and out by means of a handwheel and screw and is located at the proper distance from the vertical spindle centerline by a dowel pin and bolts.

Directly under the vertical spindle is a screw-type drill bushing which is also used for clamping the work. This bushing has an Acme thread, and a pinion pressed on the end of the bushing meshes with a hand clamping gear having two heavy pins in the upper face for inserting a hand lever. Rotation of the gear clamps and unclamps the work. The two air control valves are arranged at the operator's right and left hand, respectively, to avoid confusion in controlling the sequence of operations.

The automatic drill units have separate driving motors and are independent of each other. The tools used are combination-type drills and spot facers, and feed of the cutting tools is by means of a plate cam. The feed cams are designed to give drill feeds of 0.015 in. and spot-facing feed of 0.005 in. per revolution. The cam is designed so that its contour changes at the point where the spot-facer comes in contact with the work.

It is claimed that compared with former methods the machine saves three operators. Formerly each of the pieces had a separate group of vertical spindle drilling machines which were operated intermittently, these machines now being used for other work.

Seven Malleable Castings of Different Lengths Are Drilled and Spot-Faced on the One Machine

Indianapolis, for a manufacturer of agricultural implements.

The machine is made up of four of the company's automatic drill head units, mounted on a base and controlled by the compressed air valves located on the front edge of the bed. Problems of tool application involved

as much as 6 in., and the employment of a common jig and holding fixture for all parts, short, long, right and left-hand, was desired.

The intersecting holes were taken care of by arranging two individual motor-driven drill units in saddles. These saddles were doweled and bolted

Decimal Sample Weigher for Pieces Ranging from 1/10,000 to 1 Lb.

SAMPLE weighing scales of direct-reading type and arranged so that all readings are in decimal parts of a pound, thus obviating the necessity for mental calculation in converting pounds to ounces, have been brought out by John Chatillon & Sons, 89 Cliff Street, New York.

The device has capacity for weighing to one ten-thousandth part of a pound and is available with the scale calibrated either in pounds or grams. It is intended for wide application in the weighing or counting of small castings and machine parts, nails, rivets, screw machine products, stampings and numerous other pieces under 1 lb. in weight. The beam is of aluminum, with figures and graduations in black, and bearings are of polished agate. The knife-edge pivots are of tool steel, hardened and polished. A level is provided on the base, as shown in the illustration, and also

a level adjusting screw. The finish is in gray lacquer and all fittings are of brass, durably lacquered. A glass case with glass on all four sides and the top, to assure ample light, is

available. The case, also finished in gray, is equipped with a sliding front door so that it is unnecessary to remove the scale from the case when the scale is to be used.

The Setting for the Weighing of Nut, 52/10,000 Lb., Is Shown Above. The upper scale is read in ten-thousandths, the next in hundredths, and the lower in tenths of a pound

Self-Propelled Air Compressor

A SELF-PROPELLING four-wheel air compressor capable of handling heavy loads behind itself is being manufactured by the Pontiac Tractor Co., Pontiac, Mich. The com-

Penn unloader with hand unloader attachment. The compressor with air tank and tool box is mounted on a frame which attaches to either the McCormick-Deering or Fordson trac-

The Compressor Is Driven from the Tractor Engine. It has a radiator which is separate from the motive-power radiator

pressor is a Quincy type W-4, of 124 cu. ft. displacement. Features include a separate compressor radiator with pump-driven circulation; three-bearing crankshaft and force feed lubrication. The unit is controlled by a

tors. Power from the tractor to compressor is transmitted through a "power take-off" pulley and a clutch. The "ahead" drive of the belt brings the belt tightener into the correct relation with the belt.

Industrial Crane on Tractor Base

HANDLING materials by a locomotive crane, either in a factory or in a yard, is taken care of by a

front wheels are located close together. To start the engine, there is an extension rod with a hook on one

Short Turning Radius Is Provided by the Close Tread of the Small Wheels

California plant by means of a crane equipment mounted on a Fordson tractor. To permit the equipment to be turned in a very short radius, the

end, so that it can be hooked into the crank of the Fordson, and thus provide for cranking. Power for use in hoisting comes from the engine.

Gas Engine Driven Welders

THE Lincoln Electric Co., Cleveland, has placed on the market a 300-amp. welder (Model S-1964) direct-connected with a six-cylinder Buda gas engine, operating at 1500 r.p.m. and developing 41 b. hp. This set is entirely self-contained, and is mounted on a channel iron base, which incloses and protects the gasoline tank.

Similar electrical equipment, suitable for pipe line welding and structural fabrication, has been mounted into a self-propelled unit by the Pontiac Tractor Co., Pontiac, Mich. As shown in the view, the tractor has rubber tires (although for soft ground work crawlers are furnished and recommended) and is capable of hauling heavy loads when traveling from place to place. Similar mount-

ings are made for McCormick-Deering or Fordson tractors.

The Equipment Is Suitable for Pipe Line and Structural Welding

Foremanship Training Courses Offered at Indianapolis

TO develop and direct a systematic program of foremanship training through regular conferences of foremen in the plants of the Indianapolis members of the National Metal Trades Association and in other Indianapolis metal trades shops, the national association, in conjunction with the Indianapolis branch, will conduct a three weeks' course of daily classes, beginning Oct. 15, to train conference leaders. Each Indianapolis company employing eight or more foremen and department heads has been invited to send not more than two representatives to the classes, which will be in session 2½ hr. daily.

The classes will be conducted by A. R. Peirce, director of industrial education for the national association. The local committee in charge of this educational program consists of George P. Torrence, Link-Belt Co., chairman; Guy A. Wainwright, Diamond Chain & Mfg. Co.; Arthur R. Baxter, Keyless Lock Co.; L. C. Breunig, Vonnegut Machinery Co.; Fred Hoke, Holcomb & Hoke Mfg. Co.; V. E. McMullen, Fairbanks, Morse & Co.; Ulysses S. Leedy, Leedy Mfg. Co.; O. B. Iles, International Machine Tool Co.; Ferris T. Taylor, Dean Brothers Co., and W. D. Hamerstadt, Rockwood Mfg. Co. This committee will cooperate with the national committee headed by Louis Ruthenburg, assistant general manager General Motors Truck Corporation, Pontiac, Mich.

To discover just what the industries of the United States are doing to insure scientific handling of their traffic problems is the principal purpose of an industrial traffic management survey being made by the transportation division, Department of Commerce. Questionnaires are being distributed by the division. Present plans call for compilation of the results according to general industrial groups, among them iron and steel and hardware.

Machinery Exports Largest in 7½ Years

July Total Best Since January, 1921—Highest Record Ever
Made in Agricultural Implements

WASHINGTON, Aug. 27.—Making a gain of \$4,616,091, exports of machinery from the United States in July aggregated \$47,814,163, against \$43,098,072 in June. The increase was \$7,844,702 compared with July of last year, when the total value was \$39,969,461. For the seven months ended with July, exports of machinery were valued at \$287,579,089 in 1928, representing the large increase of \$45,658,669 over the \$241,920,420 for the corresponding period of last year. The gains in July were applicable to most lines, but were most marked in agricultural implements, which attained a record never before equaled, with a total of \$13,996,996. This was more than \$3,700,000 greater than similar exports in June and in excess of \$4,300,000 over July of last year. For the seven months ended with July, exports of agricultural implements totaled \$68,007,000, an increase of more than \$16,000,000 over the corresponding period of 1927.

Exports of industrial machinery in July, 1928, were valued at \$21,094,582, against \$20,031,155 in June, an increase of approximately \$1,060,000. In July of last year this class of

exports was valued at \$18,503,084. For the seven months ended with July, the value was \$130,313,023, against \$118,624,326 last year, an increase of almost \$12,000,000.

Exports of power-driven metal-working machinery in July were valued at \$2,562,201, compared with \$2,358,324 in June and \$1,780,313 in July of last year. For the seven months ended with July, these exports were valued at \$14,711,723, against \$10,509,046 for the corresponding period of 1927. Exports of other metal-working machinery in July were valued at \$565,100 as compared with \$512,000 in June and \$425,085 in July of last year, and for the seven months ended with July of the present year the value was \$3,535,575 compared with \$2,744,966 for the corresponding period of last year. Exports of such power-driven metal-working machinery as is listed in THE IRON AGE table was 1111 units in July, valued at \$1,734,060, against 871 units, valued at \$1,479,944, in June.

The outstanding feature of the July exports of agricultural machinery was the extremely large movement to Canada, which reached a value of \$5,958,-

603, making a total of \$29,377,201 worth of American implements which have gone to Canada during the first seven months of the year. The bulk of the Canadian purchases consisted of tractors and harvesting equipment. More than 1800 tractors were shipped to Canada during the seven months, of which 1422 were wheel tractors of from 15 to 32 hp. Other large items among the Canadian purchases were 3945 harvesters and binders, 914 combines and 552 threshers.

Decline in Imports

Imports of machinery and vehicles in July were valued at \$2,306,665, against \$2,532,494 in June and \$1,677,812 in July of last year. For the seven months ended with July the total was \$16,241,244 against \$17,009,335 for the corresponding period of last year. Imports of industrial, office and printing machinery in July were valued at \$1,516,328, against \$1,745,826 in June and \$1,052,192 in July of last year. For the seven months ended with July the value was \$9,947,108, compared with \$10,111,025 for the first seven months of 1927, a drop of 1.6 per cent.

Offers Description of Scrap

Shippers' Committee Defines Scrap Iron and Steel and Suggests Hearings for Further Consideration by Manufacturers and Carriers

ARTICLES or pieces of iron or steel that have been discarded as unfit for the uses originally intended and cannot be damaged in transportation—and are so certified in the bill of lading—are defined as scrap iron and steel in a report by a shippers' subcommittee appointed last April at the instance of the Consolidated Classification Committee. The subcommittee was appointed, following hearings in New York, Chicago and Atlanta, Ga., and a subsequent joint meeting of representatives of the carriers and shippers at Washington, to prepare a description of scrap iron and steel.

Murray N. Billings, traffic manager Illinois Steel Co., Chicago, is chairman, and the other members are H. M. DeGroat, vice-president A. M. Wood & Co., Philadelphia; H. F. Masman, National Association of Waste Material Dealers, Inc., New York; E. R. Griffith, traffic manager Sharon Steel Hoop Co., Sharon, Pa.; H. D. Rhodehouse, traffic manager Republic Iron & Steel Co., Youngstown; A. L. Dreher, traffic manager Hyman-Michaels Co., Chicago, and W. J. Hammond, traffic manager Inland Steel Co., Chicago.

The subcommittee's description of scrap, in detail, is as follows:

1-A.—Pieces or particles of iron or steel having value chiefly for remelting purposes and so certified in the bill of lading (per paragraph 1-C).

1-B.—Shipments which are an aggregate are commercially known as "scrap iron or scrap steel," and may include articles or pieces of iron or steel that have been discarded as unfit for the uses originally intended, and which cannot be damaged in transportation, and are so certified in the bill of lading (per paragraph 1-C).

1-C.—The shipper is required to certify on the bill of lading as follows: "This shipment is scrap iron or scrap steel and cannot be damaged in transportation; any articles, pieces or particles of iron or steel included therein have been discarded as unfit for the uses originally intended and the aggregate is commercially known as scrap iron or scrap steel."

.....
(Shippers Signature.)

2.—Articles, pieces or particles of iron or steel not described as required in Section 1, or articles, pieces of particles of iron or steel described as scrap iron or scrap steel but shipped without certificate as required in Section 1-C, will be subject to rate or ratings elsewhere provided therefor.

An alternate description submitted by E. R. Griffith defined scrap iron or scrap steel as "material having value chiefly for remelting purposes, which cannot be damaged in transit."

The shippers' committee suggested that the Consolidated Classification Committee set definite dates at New York, Chicago and Atlanta during the October session, so that all shippers

who desire may be heard and that greater publicity and a wider and more complete discussion may be had for the benefit of the various freight associations.

Steel Ships to Be Built Under Provisions of Mail Contracts

WASHINGTON, Sept. 1.—Under authority conferred on him by the Jones-White merchant marine act, Postmaster General New has awarded contracts for ocean mail service on seven routes on the Atlantic and Pacific Oceans. These awards will become effective Oct. 1, and will run for 10 years. The successful bidders obligate themselves to construct new vessels during the term of the contracts. The ships must be of steel and built in domestic shipyards. The materials must be purchased in the United States.

All told, the contracts just awarded will call for the construction of 17 vessels: eight of 4800 gross tons each, three of 4000 gross tons or more, four of 4000 gross tons each, one of 6000 gross tons and one of 3000 gross tons. Previously mail contracts were awarded under the Jones-White act that will call for the construction of four vessels of not less than 3000 tons each. These latter mail contracts were awarded to the Export Steamship Corporation, New York. Those just awarded went to the American Scantic Line, New York; the American West African Line, New York; the Atlantic & Caribbean Steam Navigation Co., New York; the New York & Cuba Mail Steamship Co., New York, and the States Steamship Co., Portland, Ore.

Reduction in Number of Iron and Steel Workers

Employment reports of the United States Bureau of Labor Statistics show a reduction of about 1 per cent in the number of employees in 197 establishments making iron and steel in July, as compared with the total for the same establishments in June. The drop was from 264,399 to 261,843. Payrolls for one week suffered a considerably greater decline, falling from \$8,238,688 to \$7,764,125, a loss of 5.8 per cent.

Foundry and machine shop establishments to the number of 975 showed similar but less marked declines. The drop in number of employees was from 239,545 to 239,007, and in payroll from \$7,288,821 to \$7,052,358, a loss of 3.2 per cent.

Machine tool establishments to the number of 151 showed a gain of 1.5

per cent in number of employees, but a loss of 2.6 per cent in aggregate payroll. That was the only classification of the eight in the iron and steel group that showed a gain in employees. All of the eight showed a loss in total payroll, the maximum loss having been 12.8 per cent in stove manufacturing, accompanied by a decline of 8.1 per cent in employees in that industry.

Waterborne Commerce of New England Ports

The board of engineers for rivers and harbors, War Department, has issued Port Series No. 18, constituting one of a series of 22 volumes on the ports of the United States. Prepared in cooperation with the bureau of operations of the United States Shipping Board, the report covers New Bedford and Fall River, Mass.; Providence and Newport, R. I., and New London, New Haven, Bridgeport, Norwalk and Stamford, Conn. Statistics contained in the report show that, during six recent years, the waterborne commerce of the nine ports has averaged 11,225,613 tons annually. Bridgeport surpasses the other ports in the tonnage of brass and copper, pig iron, scrap, iron and steel, and machinery and vehicles.

Concrete Steel Institute to Meet Oct. 1 to 3

The semi-annual meeting of the Concrete Reinforcing Steel Institute will be held at the Buckwood Inn, Shawnee-on-Delaware, Pa., Oct. 1 to 3. Charles J. Graham, president Bolt, Nut and Rivet Manufacturers' Association, Pittsburgh, will address the first session of the meeting on "Constructive Selling." At the morning session on Oct. 2 Walter C. Conger, vice-president Truscon Steel Co., Youngstown, will speak on "Control of Selling Costs," and Frank Burton, former city building commissioner at Detroit, will talk on "A History of Building Codes."

Other sessions of the meeting will be given over to open discussions of unusual construction jobs and concrete ribbed floor construction. A feature of the convention will be the semi-annual golf tournament. M. A. Beeman, Tribune Tower, Chicago, is secretary of the institute.

Victor A. Dorsey & Co., First National Bank Building, Chicago, have been organized to continue the business formerly conducted by Hagenah & Dorsey, consulting engineers specializing in appraisals, cost analyses, rate studies, economic surveys and investigations of public utilities. Mr. Dorsey has been associated with Mr. Hagenah as junior partner for 18 years. The latter recently severed his connection with the company to become associated with public utility interests.

This Issue in Brief

Oxy-acetylene and arc welding do not compete, but supplement each other, according to Swiss manufacturer's experience. When finished work must be uniform throughout he prefers oxy-acetylene welding, believing that the properties of the weld material then correspond closely to those of the plate.—Page 570.

* * *

Full benefits of bend test are obtained by use of new bend extensometer. Formerly quantitative results were not obtainable. New instrument measures extension of outer fibers at failure, which, when calculated against degree of curve and thickness of specimen, gives the percentage of fiber elongation.—Page 575.

* * *

Aluminum alloy found to be sufficiently strong for use in anti-aircraft gun mounts, displacing steel castings. The alloy has 6 per cent elongation, 13,000 lb. per sq. in. yield point, with 28,000 lb. per sq. in. ultimate strength. Aging consists of holding one week at 400 deg. Fahr.—Page 574.

* * *

Wage earner population comparison shows shift of industry. In quarter-century New England has gained 32 per cent, Pacific Coast 237 per cent, Middle Atlantic States 55 per cent, and East North Central group 118 per cent.—Page 574.

* * *

Will undertake to standardize gages. Manufacturers and users of gages will gain by replacing the great number of sizes and types now being manufactured by a comparatively small number of sizes, A. S. M. E. committee believes.—Page 578.

* * *

Suggests quartz take the place of antimony in calibrating pyrometers. Government physicists find that changes occurring in clear quartz at 573.3 deg. C. are so marked that it can be used as a fixed point in pyrometer calibration.—Page 570.

Study X-ray photographs of welds with care. Even if there is no fault in the weld, the photograph may show light and dark lines, owing to the fact that the cross section of a good weld can vary considerably.—Page 568.

* * *

Proposed mileage scale would disintegrate industrial centers. Increases in short-haul freight rates on iron and steel and elimination on short hauls of groups of origin and destination would make it advantageous for consumers to move as close as possible to sources of supply.—Page 612.

* * *

Hammers gas-welded pipe joints when red hot to increase strength. Edges are slightly bent inward, the joint is reinforced externally, and the reinforced weld is practically symmetrical. Steel plate fabricator then anneals the joint to improve the microstructure of the metal at the union and to eliminate residual stresses due to fabrication process.—Page 568.

* * *

Direct-current welding is easier to learn, Swiss manufacturer believes, and it does not require such special welding wire. However, alternating current uses less electrical energy.—Page 567.

* * *

Machinery exports highest in seven years. July shipments totaled close to 48 million dollars, a gain of 11 per cent over those of June, and best month since January, 1921.—Page 583.

* * *

Hardening furnace has variable-speed rotating hearth. Hearth makes a complete revolution in from 20 min. to 2 hr., depending upon the character of the work. The furnace has two heating zones. A temperature of 1600 deg. Fahr. may be maintained with 1.2 cu. ft. of 570 B.t.u. gas for each pound of work.—Page 579.

Cuts enameling costs by use of inverted U-shaped oven. Steering gear parts are suspended from racks attached to a conveyor, which travels up a grade of 70 deg. to the oven. Parts are baked for 45 min. at 500 deg. Fahr. Air flows through the oven counter to the direction of the work. Thus the finished parts are cooled by intake air, and the incoming parts preheated by what would otherwise be waste heat.—Page 573.

* * *

Consider the personal character of the welder, as well as his skill, if he is to be given important work difficult to control. In Swiss plant pieces are always taken from the work under construction and submitted to thorough tests. In addition, a number of special test pieces are constantly welded, to test the skill of a welder.—Page 569.

* * *

Scrap is defined by shippers' committee. "Pieces or particles of iron or steel having value chiefly for remelting purposes and so certified in the bill of lading . . . including articles or pieces of iron or steel which have been discarded as unfit for the uses originally intended, and which cannot be damaged in transit. . . ."—Page 584.

* * *

New credit stringency will do more harm to commercial business than it will do good in checking stock market speculation, says editorial writer. This seems to be the only cloud now gathering on our economic horizon, and none of our forecasters seems able to give a convincing explanation of what it means.—Page 586.

* * *

Pig iron daily output gained 2.1 per cent in August. Production averaged 101,180 tons a day, an advance of 2089 tons over July average. On Sept. 1 there were 183 furnaces in blast, with 98,730 gross tons daily capacity, against 185 furnaces in blast Aug. 1, with a capacity of 98,445 tons a day.—Page 590.

THE IRON AGE

W. W. MACON
Managing Editor

ESTABLISHED 1855

Labor, Income and Credit

IT will be agreed that the total national income is a function of labor. Irrespective of division between what is commonly called capital and labor, which may give each party a varying command upon goods and services, the proceeds must be expended for labor in one way or another. The landlord receives rent for the use of what is a fixation of labor of the past, but what he receives is going to be expended for future labor, unless it be converted into gold, jewels or something else representing past labor.

The national income is therefore essentially a function of the number of workers, the number of hours they work, and their efficiency in working. In 1926 the United States had about 46 million workers. We may generalize a working time of 50 hours per week and 50 weeks per year, or 2500 hours per year, which would indicate a maximum of 115 billion man-hours.

It seldom happens, however, that all of the workers are employed. A certain proportion is always idle owing to sickness, unwillingness, and inability owing to economic maladjustments or seasonal difficulties. We think of 97 per cent occupation as extraordinarily high, 95 per cent as high and satisfactory, 90 per cent as reflecting hard times, 85 per cent as the index of extraordinary depression, as in 1921. We believe that the rate of American employment in 1925-27 has been about 95 per cent. There are not, however, definite data as to this.

Assuming, nevertheless, a rate of 95 per cent of employment, the total number of work-hours may have been about 109 billion. Allowing for economic maladjustments, such as exist in the textile and bituminous coal mining industries, and seasonal idleness such as exists constitutionally in boot and shoe manufacturing, in building and construction work, etc., let us think of a total of 100 billion work-hours. If the national income of 1926 were 75 billion dollars, this would correspond with an average of 75 cents per worker per hour, or about \$1,875 per year. Probably a figuring for 1927 and the first half of 1928 would not be greatly different as to that quotient.

With this broad sketch of the creation of our national income it is easier to comprehend how it is affected by changes in fundamental conditions. Increase in population swells it automatically. Similarly does increase in percentage of employment. Likewise does increase in the degree of exertion per man per hour. Most important of all, however, may be increase in managerial efficiency, especially by the introduction of new inventions and the improvement of

organization, enabling units of production to be made with fewer workers, which is equivalent to increasing the number of workers available.

Diminishers of production, and consequently of national income, are contraction in percentage of employment, decrease in number of hours worked per year, reduction in performance per man per hour.

In each one of the foregoing respects, plus and minus, there are developments all the time. Increased population is the only factor that holds fairly steady. Percentage of employment varies from month to month and from year to year. Hours of employment also vary; but in general the trend is downward, so that what was 55 hours per week only a few years ago is now but 50, with only 40 hours' work in some trades and with the declaration of organized labor that a 40-hour week is its goal. We may also entertain the belief that managerial efficiency is constantly improving. The problem of quantitative economics is to weigh and measure these counteracting factors. We are not yet able to do this very well, wherefore there is more or less controversy and some uncertainty.

While the national income and consequently prosperity are therefore a direct function of the employment and efficiency of labor there are many causes that affect the degree. The greatest of these is the position of credit, which may be impaired by lock-up in goods as in 1920-22, or by lock-up in unproductive construction, which is much worse. At the present time we are experiencing a contraction of credit for reasons different from either of these, and indeed for reasons that we do not understand perfectly. Among the reasons, however, is clearly the surrender of a great quantity of gold to Europe. The thing that causes us concern is whether this new stringency in credit is going to be short or long, for the harm it will do to commercial business is likely to be more than the good it can do in checking stock market speculation. This seems to be the only cloud that is now gathering on our economic horizon. Unfortunately, none of our economic forecasters has been able to give us a convincing explanation of what it means.

VERY literally aircraft manufacture in the United States is an infant industry, probably the youngest in that class, yet its infancy has not prevented its participation to an increasing extent in international trade. Our exports of airplanes in the first six months of this year were 87 as against 19 in the like period of 1927—an increase of more than 350 per cent—while of aircraft engines the number exported

increased from 23 to 65. On a similar scale was the expansion in foreign demand for aircraft parts and accessories. To July 1, this year, the value of exports of these descriptions was \$527,095, as against \$189,178 for the first half of last year. Considering that this export trade is but a fraction of the remarkable domestic development in aircraft in the eventful 15 months since May, 1927, there is ample reason for an optimistic view of the future demand for light metals, special steels and alloys in the mechanism of air transport.

Tubular Goods for Oil and Gas

WHILE the oil and gas field demand for tubular goods has been disappointing in the last year and more, there is no sound basis for assuming that it will require a period of years for recovery, as has been intimated in some quarters. There are various considerations outside the point that production became excessive two years ago. Even the sharp increase in total production that came in the latter part of August should not be disconcerting, for that was due to a rise of flush production in Oklahoma, now practically at an end.

The large orders placed within the last ten weeks for line pipe for natural gas transportation brought a large tonnage to the steel industry, and there is more of this business to come. No great effect was felt by the producers of pipe and tubes, since demands for oil and gas line have lately expanded into two relatively new types. For a long time line pipe was all fire-welded pipe. Then seamless pipe made a place for itself, also electrically welded, so that now there are three producers instead of one, but steel is involved just the same.

The Bureau of Mines petroleum report for July shows substantially uniform supply, in production plus imports, for somewhat more than a year, and it shows stocks at their maximum in April, with a growing decline in the three months following.

As a matter of fact last year was not so poor a tubular goods year as common report had it during the year. Indeed, production of "oil country goods" in welded and seamless combined decreased from 1926 to 1927 by less than 1 per cent, whereas there was 8.9 per cent decrease in ordinary standard or merchant pipe. The first half of last year was fairly active in demand for oil and gas well tubular goods, the second half being poor, as has been this year to date, although some improvement has been observed recently in demand from California.

Some measure of the changing activity is furnished by statistics of the number of producing oil wells completed in seven months of four years, as follows:

1925	9,711
1926	10,139
1927	9,318
1928	6,623

It will surprise many to learn of the small average production of the oil wells of the United States. One hears of the heavy production of new wells, but little of the smaller output as they grow old, whereby new wells are constantly needed, in the long run, to maintain production, while the old wells frequently require some additional material. In 1925, the average daily production of the 306,100 oil wells in the United States was 6.5 barrels; for 1926, the figures are 318,600 wells and 6.8 barrels; for 1927, 323,300 wells and 7.7 barrels.

Last year the average in the whole State of Pennsylvania was only three-tenths of a barrel daily. The highest producers, in daily rates per well, were: Gulf Coast of Louisiana, 56.5 barrels; California, 55.9 barrels; Colorado, 51.7 barrels; Gulf Coast of Texas, 50.3 barrels.

Motives in Pension Systems

WRITING for *Industry*, the publication of the Associated Industries of Massachusetts, E. Grosvenor Plowman makes an analysis of motives governing the establishment of pension systems in manufacturing industries. The most popular old age pension method in this country, he says, has been some modification of the United States Steel Corporation's plan, which gives the employees a retirement allowance based upon the total years of service multiplied by an agreed percentage of average pay. The management has usually attempted to control the selection of those to be pensioned, at least within certain limits.

The effect of this control, the author shows, has been to introduce three distinct grounds on which pensions are now being granted. One is that of need, which "frequently has resulted in sharp discrimination between the comparatively unworthy employee who needed a pension and the comparatively unworthy employee who had saved enough to make the pension unnecessary." The second ground is the "reward basis, many employers regarding the pension as a reasonable payment to their older workers." Concerning the third reason, operating efficiency, Mr. Plowman makes this comment:

This reason for granting old age pensions is of comparatively recent origin. It was developed by the personnel managers of large corporations about four years ago. It has grown out of the intense efforts made by these companies to develop efficiency. It has been calculated that a company saved money by pensioning older workers instead of keeping them as concealed pensioners. The concealed pension often amounts to more than the actual pension. The concealed pensioner was also the cause of general reduction of speed and efficiency of an entire operation or a whole group of workers.

None of the well-established industrial pension systems, so far as we can learn, discriminates between those employees who need assistance in their old age and those who do not. The unworthy employee seldom figures, for the gaining of a place on the pension list involves long years of work and the unworthy drop by the wayside. Certainly the Steel Corporation's system makes no distinction. Everyone in the organization, high or low, is entitled to a pension if he has continued in employment up to the established age limit.

The motives behind these systems are complex. It is a combination reward for long and faithful productive service. It is an expression of desire that the veterans round out their lives in decent comfort. But there is also, as frankly expressed, the belief that a pension system is profitable to the owners, in its effect upon labor turnover, esprit de corps, and in a measure the elimination of the concealed pension, so-called.

Employers of labor long ago realized that paternalism, whether expressed or implied, is poor business in its reactions upon the self-respecting worker; that to make a success of any pension system it must be made clear to every one affected that it is established

for the good, not alone of the man who gets the pay envelope, but of the organization that pays him and reaps a profit from his labor.

Great Loss in Union-Mined Coal

FINAL statistics of coal production, by counties and use, in the State of Pennsylvania, have come from the Geological Survey. A comparison with the figures issued four years ago for the year 1923 shows remarkable changes, chiefly as a result of some fields in the State having been union. Quite significant is the change whereby the Connellsville region now makes relatively little coke, but ships a larger quantity of by-product coal. Our present references are entirely to bituminous coal, anthracite not being considered.

From 1923 to 1927 the country's total decreased 8 per cent, but that of Pennsylvania decreased 22 per cent. The manner in which the change came about is depicted by giving production of those counties which ran over 5,000,000 net tons in either year. The comparison, arranged in the sequence, by percentage, of gains and losses, is given below:

Coal Production, Pennsylvania Counties			
	1923, Net Tons	1927, Net Tons	Change, Per Cent
Greene	3,982,003	6,742,579	+69.4
Somerset	8,530,618	10,230,220	+20.0
Armstrong	5,061,732	5,618,029	+11.0
Fayette	32,165,961	30,259,320	-5.9
Indiana	10,475,299	9,414,644	-10.1
Westmoreland	25,408,870	19,825,394	-22.0
Cambria	19,751,465	14,562,378	-26.2
Clearfield	7,546,058	4,462,547	-40.8
Allegheny	20,224,239	10,348,468	-48.7
Washington	24,499,103	12,029,128	-50.9

Greene county is at the southwest corner of the

State, containing a portion of the Lower Connellsville region, while Fayette covers much of the remainder of the Connellsville region, including some of the oldest workings. The whole section has been non-union almost from time immemorial. Greene county, being largely new, had a great increase, while Fayette almost broke even, exhaustion of old mines preventing an increase. Westmoreland county, chiefly union until a few years ago, lost somewhat heavily, not so much as if the change to non-union had been more recent.

Allegheny and Washington counties, representing by far the greater portion of the Pittsburgh union district, lost heavily. Together they fell off almost precisely 50 per cent. Last year they had three months of production under the difficult conditions of the Jacksonville scale, with some open shop operation by the Pittsburgh Coal Co. In the remaining nine months they had more open shop operation by that company and the beginning of open shop operation by others. This year they are making up some of the loss. Clearfield and Cambria will make up some of their losses. Coal has grown so difficult to market that the old alignment will probably never be restored. The fields once union and now non-union can hardly have a complete recovery.

In 1923 Pennsylvania coked (beehive) at mines 23,738,340 tons of coal, chiefly in Fayette county (15,963,254 tons) and Westmoreland (5,582,979 tons). In 1927 the State coked at mines 8,444,935 tons, or a decrease of 64 per cent. Fayette dropped to 6,199,220 tons and Westmoreland to 1,789,050 tons. In total coal production Fayette lost only 5.9 per cent, the county's coal shipments increasing 55 per cent, chiefly for by-product purposes.

CORRESPONDENCE

Purchasing Agents and a "Better Price"

To the Editor:—The editorial in your issue of Aug. 23 on "Gains from Stabilized Prices" includes purchasing agents with brokers and professional speculators in opposition to stability of prices. I am sure this is unjust to a considerable percentage of your readers or subscribers, if you mean stability by lawful methods. No group has been more willing to secure proper stabilization than representative purchasing men.

Inclusion in this opposition group, although entirely wrong, is not as serious as the reason you give for the inclusion of purchasing agents in this group. If the value of purchasing agents is to be measured by their expertness to beat the quotational average, as you say, no ability would be required, as orders would go to the lowest bidder on every inquiry. Twenty-five years ago that statement might have been true, for then price and sentiments were about the only elements entering into a purchase or sales transaction. The elements entering into a purchase contract and the order of their importance are now generally accepted to be:

1. Suitability of material to requirements,
2. Availability of the material,
3. Credibility of the supplier,
4. Price.

On this basis I think you will agree that purchasing agents by their attitude have contributed very much to our

economic stability and the purchasing policy of our representative commercial organizations is very sound and practical.

G. A. RENARD.

Secretary-treasurer, National Association of
Purchasing Agents, Inc.

New York, Aug. 28.

Outdoor Recreation for Employees

The widespread development of outdoor recreation for employees is dealt with in a booklet recently brought out by the Policyholders' Service Bureau of the Metropolitan Life Insurance Co., New York. Attention is called to the work of the National Cash Register Co., Dayton, Ohio, which has given to the city Hills and Dales Park, of 325 acres, and provides many other recreational activities for its employees. The American Rolling Mill Co., Middletown, Ohio, developed four playgrounds which were later turned over to the city, and at present owns and maintains a 400-acre park, providing tennis courts, a golf course, a swimming pool, camping grounds and other facilities. The United States Steel Corporation, whose work in this field is well known, has provided playgrounds for children in 125 communities.

The advantages of competitive sports are set forth, particularly as developed in the Janesville, Wis., works of the Chevrolet Motor Co. and the Schenectady, N. Y., plant of the General Electric Co. Various other subjects are discussed, such as annual outings, gardening, noon-hour games, country clubs and summer camps. An appendix provides data on standard sizes of fields for various games and further information regarding programs for outings and field days is included.

Mechanical Engineers at Twin Cities

Mechanization of Iron Mines One of the Topics Discussed at St. Paul-Minneapolis Meeting

MECCHANICAL engineering in iron mining came in for special attention at the summer meeting which the American Society of Mechanical Engineers held this year, Aug. 27 to 30, inclusive. The main sessions of the meeting took place at St. Paul, at the St. Paul Hotel, but visits to points of interest, including industrial plants, were made in both Minneapolis and St. Paul. Besides the iron mining session the program provided, among others, for aeronautics, applied mechanics, apprenticeship, fuels, materials handling, power, printing and research, all under the auspices of corresponding divisions and committees of the society, and in addition a joint session with the American Society of Agricultural Engineers and a session on flour milling.

In all there were some 23 papers scheduled, a full series of social affairs for the evenings, including a banquet Wednesday, and a long list of industrial and other establishments open for conducted visits. The convention was well attended and made particularly attractive to Eastern members through a tour arranged by the society with the New York Central Lines. Some 96 thus participated in a group which traveled from Buffalo to Duluth by way of Lakes Erie, Huron and Superior, made a sortie by special train to Winnipeg, Manitoba, before reaching St. Paul and Minneapolis, and took the Duluth-Buffalo water trip for the return journey.

Among the plants visited were those of the William Bros Boiler & Mfg. Co., the Minneapolis Steel & Machinery Co., which was turning out tractors on a mass production basis of 23 to 25 daily of a moderate size and several of a large size, and the Ford Motor Co., which besides assembling motor cars and trucks was manufacturing plate glass by the continuous process and in sufficient quantity to supply the general commercial market. The tour party en route was shown through the Cadillac automobile plant at Detroit, the power plant at the Soo locks and, in part, the carbide works there of the Union Carbide & Carbon Co.; the copper country centered at Houghton, Mich., including studies of the mine hoists, the ore stamping plants and the development for recovering copper from the sands hitherto wasted, and the mines at Hibbing, Minn., particularly the Hull-Rust-Sellers-Mahoning pit, which now has an area of 875 acres, a maximum depth of 275 ft. and contains 58 miles of railroad track.

The iron mining papers were contributed by Anton Tancig, mechanical superintendent of the Shenango Furnace Co., Chisholm, Minn., who told of the almost complete mechanization of the mines on the iron range of Minnesota, and by A. C. Butterworth, electric

cal engineer, mining department, Pickands, Mather & Co., Duluth, who discussed the applications, possible as well as developed, of electric power in the Lake Superior district. Jonathan A. Noyes, district manager, Sullivan Machinery Co., and president Duluth Engineers' Club, presided at the session.

What Mechanical Devices Have Done for Railroads

The improved operations of the railroads and the industrialization of the farm were the topics of the banquet. Ralph Budd, president Great Northern Railroad, dwelt particularly on the increased efficiency with which the railroads were now handled and attributed it largely to the broad introduction of various mechanical devices. In the eight years since the railroads were returned to private control, they have spent more (some six billion dollars) than in any like period of railroad history, and this expenditure has been done with substantially no expansion in the way of new tracks. One-half of the expenditure of the eight-year period, he estimated, had gone for mechanical improvements. Through the working of the restriction of the immigration law, he pointed out also that the railroads now have a large percentage of what may be called preferred labor, and one result is that the number of ton-miles of freight moved per employee has increased since 1920 from 202,000 to 247,000. For the Great Northern itself, the ton-miles per man in 1920 was about 206,000 and in 1927, some 300,000.

Economic Farm Unit

The speaker on the farm question was Thomas D. Campbell, president Campbell Farming Corporation, Hardin, Mont., which operates a 95,000-acre farm. He argued that a guaranteed price for wheat has always proved a failure and it would again. He held that a 2000-acre farm is the economic unit, and that aggregations of land of this order will go far toward solving the farm problem. He believes that the tariff can solve the farmers' troubles without new legislation, and urged particularly that business men study the farm problem. The view is too commonly accepted that farming is essentially unprofitable, whereas, he argued, it was entitled to a dignified position and offered itself as a profitable study for the mechanical engineer; that more power could properly be used, or, in a word, that the farm should be industrialized.

Committees

The local committees proved that they had done careful planning and were especially active in caring for the needs and comfort of the visitors.

J. J. Summersby, Jr., sales manager at St. Paul for the Worthington Pump & Machinery Corporation, was the general chairman of the local executive committee. Lawrence Washington, University of Minnesota, was secretary. There were various special committees, with E. W. Ashenden, mechanical engineer William Bros Boiler & Mfg. Co., Minneapolis, chairman of the finance committee, and Paul Doty, chairman Minnesota State Board of Registration, St. Paul, chairman of the committee on technical events.

New Members, Iron and Steel Institute

Seventeen officers and others connected with American iron and steel companies are on the list for election to membership at the meeting of the (British) Iron and Steel Institute to be held on Sept. 25. The names are as follows:

James A. Farrell, president United States Steel Corporation, New York; Charles W. Heppenstall, president Heppenstall Forge & Knife Co., Pittsburgh; Harold L. Hughes, assistant to president United States Steel Corporation, New York; J. Stewart Huston, metallurgist Lukens Steel Co., Coatesville, Pa.; Hjalmar W. Johnson, general foreman blast furnaces, Illinois Steel Co., Chicago; Dr. John Johnston, director of research, United States Steel Corporation, New York; Selwyne P. Kinney, metallurgist United States Bureau of Mines, Minneapolis; Lawrence S. Marsh, manager department of inspection and metallurgy, Inland Steel Co., Chicago; William W. Scott, Jr., president Laclede Steel Co., St. Louis; Erwin Sohn, director research division, Standard Sanitary Mfg. Co., Pittsburgh; John A. Succop, chief of research, Heppenstall Forge & Knife Co., Pittsburgh; William J. Sullivan, secretary to the president United States Steel Corporation, New York; Thomas E. Taylor, European manager United States Steel Products Co., London; Thomas L. A. Taylor, manager wire department United States Steel Products Co., London; Robert C. Thompson, Bessemer superintendent, Carnegie Steel Co., Mingo Junction, Ohio; William H. Warren, general manager Lukens Steel Co., Coatesville, Pa.; Ralph H. Watson, general superintendent Homestead works, Carnegie Steel Co., Munhall, Pa.

The Ex-Cello-O Tool & Mfg. Co. is moving to its new plant on Oakman Boulevard, Detroit, where it is expected additional new machinery and equipment will enable this company to cope with a steadily growing demand for its products. A new drill bushing catalog has been issued by the company, which offers a new feature. By turning to the pages covering the hole size desired, one finds there, all in one place, all of the bushings offered in that size with dimensions, code words, etc.

Gain in August Iron Output

Daily Rate Last Month Gained 2089 Tons or 2.1

Per Cent Over July—Net Loss of
Two Furnaces

PRODUCTION of pig iron in August, from data collected largely by wire on Sept. 4, show an increase in daily rate over July but a net loss in furnaces. In most cases actual data were furnished by the producing companies.

Total August coke pig iron output was 3,136,570 gross tons or 101,180 tons per day for the 31 days as contrasted with 3,071,824 tons or 99,091 tons per day for the 31 days in July. This is an increase for August of 2089 tons or 2.1 per cent. In July there was a decrease of 3642 tons per day or 3.2 per cent. The August daily rate last year was 95,073 tons,

which was a decline from July of that year of 126 tons per day. Thus August this year showed an increase over July while last year there was a decrease.

Capacity Active on Sept. 1

There were 183 furnaces active on Sept. 1, with an estimated operating rate of 98,730 tons per day. This compares with an operating rate of 98,445 tons per day for the 185 furnaces active on Aug. 1. The apparent contradiction of a slightly higher operating rate for the 183 furnaces than for the 185 furnaces is probably due to the fact that some large steel pro-

ducing companies drove their furnaces very hard during the month.

Of the seven furnaces blown in, one was a Steel Corporation stack, with the remaining six equally distributed between independent steel making companies and merchant furnaces. Four Steel Corporation stacks, three independent steel company furnaces and two merchant stacks were shut down. This is a net loss of three furnaces for the Steel Corporation and a gain of one merchant furnace.

Steel and Merchant Iron

Steel-making iron in August was made at the rate of 82,642 tons per

*These totals do not include charcoal pig iron. The 1927 production of this iron was 164,569 tons.

Daily Pig Iron Output in August Was 2.1 Per Cent More Than in July; Composite Prices Substantially Unchanged
Inclined line represents the gradually increasing theoretical needs of the country, ascertained by a balancing of the ups and downs in production. It shows an average yearly increase in consumption of about 415,000 tons

day as compared with 79,513 tons per day in July, a gain of nearly 4 per cent. Merchant iron in August was produced at the rate of 18,538 tons per day as compared with 19,578 tons per day in July, a loss of 1040 tons per day.

Furnaces Blown In and Out

During August the following furnaces were blown in: One Susquehanna stack of the Hanna Furnace Co. in the Buffalo district; one Bethlehem furnace of the Bethlehem Steel Co. in the Lehigh Valley; one Monongahela stack of the National Tube Co. in the Pittsburgh district; one Cambria stack of the Bethlehem Steel Co.

and the Adrian furnace in western Pennsylvania; the Grace furnace of the Youngstown Sheet & Tube Co. in the Mahoning Valley, and one Vanderbilt stack of the Woodward Iron Co. in Alabama.

Furnaces blown out or banked during the month were as follows: One Bethlehem furnace of the Bethlehem Steel Co. in the Lehigh Valley; one Isabella stack of the Carnegie Steel Co. in the Pittsburgh district; one Cambria stack of the Bethlehem Steel Co. in western Pennsylvania; one Central stack of the American Steel & Wire Co. and one Toledo furnace of Pickands, Mather & Co. in northern Ohio; one Gary furnace of the

Illinois Steel Co. in the Chicago district; one furnace of the Colorado Fuel & Iron Co. in Colorado, and one Bessemer stack of the Tennessee Coal, Iron & Railroad Co. and one Woodward stack of the Woodward Iron Co. in Alabama.

Carnegie Steel Co. Adds Strip Pickling Equipment

The Carnegie Steel Co. has added pickling, oiling and liming equipment at its McDonald, Ohio, works, and thus technically enters the ranks of strip steel manufacturers. Actually the company has long manufactured hot-rolled flat steel, but has designated its product as hoops and bands. Uses for hoops and bands have changed so materially in the past 10 years, notably in the case of hoop steel, only a small amount of which now is used for cooperage, that the only distinction between hoops and bands and strips has been that makers of the latter have been expected to be able to pickle, oil and lime their products.

The Indianapolis Chapter of the American Society for Steel Treating will open its 1928-1929 program Sept. 10 with an address on "Pyrometry" by Claude S. Gordon, president Claude S. Gordon Co., Chicago.

Iron and Steel Markets

Heavy Steel Specifications

Large Releases Against Contracts Point to Postponement
of Fourth Quarter Price Test—Pig Iron Buying
Movement Still Under Way

BUYERS of both pig iron and steel are covering their needs more liberally. To escape price advances pig iron consumers generally have been contracting for their fourth quarter requirements. Users of finished steel are accomplishing the same purpose, in a measure, by specifying heavily against expiring contracts.

In shapes, bars, plates and sheets the higher quotations announced for next quarter, together with the fixing of Sept. 10 as the closing date on releases against current contracts, have had the effect of driving in an unusually large volume of specifications. In sheets, specifying has been further stimulated by the reduction in the cash discount, which goes into effect Oct. 1.

It is beginning to appear that an earlier closing date for specifications will fail to achieve its purpose of preventing a large carryover into the next quarter. The full extent to which buyers will anticipate their forward requirements will depend on the amount of steel released for rolling in the next four days. If present indications are borne out, buyers not only will specify fully but, in some cases, will overspecify.

For sheets, as well as the heavier rolled products, there has been a rather steady increase in specifications since Aug. 1. While steel consumption may have gained in the same period, it is likely that a growing tonnage has been going into stock. At Chicago it is estimated that many consumers of sheets will be able to supply their needs from stock through October and possibly November.

A real test of price advances for fourth quarter is necessarily deferred. While there is little interest in contracts for that period, some of the large buyers who have sounded out the mills on prices are confident that business in bars, plates and shapes will be accepted at 1.95c., and possibly 1.90c., Pittsburgh, as contrasted with the announced quotation of 2c. Although a failure to achieve advances aimed at would be repeating previous experiences of the mills this year, a price of 1.90c. would be \$1 higher, and of 1.95c., \$2 a ton higher, than the prevailing contract figure for the present quarter.

In strip steel, also, announced advances for the final quarter cannot be taken at face value, since large-tonnage buyers were allowed to cover their requirements through the year at third quarter prices.

The extent to which mills may succeed in increasing prices remains in doubt, but the volume of bookings, chiefly in specifications, leaves little to be desired. Although tin plate output has shown a seasonal decline to 75 per cent of capacity, steel production as

a whole is holding its own and may possibly gain in the course of the month. In sheets the American Sheet & Tin Plate Co. had the largest August bookings and shipments since 1917.

Taking into account the rising scale of demand and production in July and August and the assured high rate of operations this month, a record third quarter steel production is looked for.

Contrasted with evidences of buying to circumvent higher prices are pressing demands for steel for early consumption, notably from automotive plants. Several Michigan motor car builders have increased production on new models and are taking more steel. The industry as a whole has set out to make 400,000 cars and trucks this month.

Rising consuming needs are seen in mounting business in machine tools. August sales were larger than in July, and some Cincinnati plants are operating at the highest rate since 1919.

Another sign of expanding industrial activity is the increasing melt of foundries, as indicated by shipments of coke and pig iron. The buying movement in pig iron is still under way, for both large and small foundries.

Sales of foundry and malleable grades at Cleveland totaled 40,000 tons, following bookings of 310,000 tons in the month of August. Buffalo reported 60,000 tons of pig iron sold, while the totals for the week at Philadelphia and Chicago were close to 50,000 tons each. At Chicago, where the market was raised to \$18, furnace, last week, another increase of 50c. a ton is an early possibility. In the Valleys advances of 25c. to 50c. a ton have not yet been tested, since there was general coverage at the previous prices.

Pig iron production in August, compiled from returns to THE IRON AGE, was 3,136,570 tons, or 101,180 tons per day, against 3,071,824 tons, or 99,091 tons per day in July—a gain of 2089 tons or 2.1 per cent in the daily rate. There was a net loss of two active furnaces in the month. However, the daily operating rate of the 183 active furnaces as of Sept. 1 is estimated at 98,730 tons, compared with 98,445 tons for the 185 stacks in blast Aug. 1, indicating a higher output per furnace. The loss in active furnaces was wholly in steel works stacks, merchant furnaces having shown a net gain of one.

Structural steel awards, at 30,000 tons, were considerably smaller than the totals of previous weeks in August.

Both of THE IRON AGE composite prices remain unchanged, that for pig iron at \$17.34 a ton and that for finished steel at 2.348c. a lb.

Pittsburgh

Further Heavy Steel Specifications Expected to Result From Adherence to Sept. 10 Deadline—Pig Iron Prices Advanced

PITTSBURGH, Sept. 4.—The steel market has lost little of its recent activity, either in specifications or in plant operations. New business can show some shrinkage without greatly cutting into this month's mill engagement as so much momentum has been created by last month's activity, which far outstripped that of the month before in almost all finished products. Tin plate lately has been faltering in point of demand and this week has seen some recession in mill operations, but in sheets the American Sheet & Tin Plate Co. reports last month to have been the heaviest August in point of orders and shipments in the history of the company, with the possible exception of 1917, a war year. Some additional acceleration to this month's plant activities seems likely from the firm adherence to the Sept. 10 deadline for the receipt of specifications on third quarter contracts for bars, plates, shapes and sheets.

The automobile industry has set out to make 400,000 cars and trucks this month. It is not only taking steel freely, but demands prompt deliveries.

Taking into account the rising scale of demand and production in July and August and the assured high rate of plant engagement this month, it begins to look as if the third quarter of this year would set a new high record production mark for such a period.

Strip steel makers do not appear to have been successful in their efforts to lift prices on fourth quarter business, at least not on the larger tonnages, and the fear is expressed in some quarters that sheet makers have taken a little too much business at current price to profit greatly by the higher prices named for fourth quarter tonnages. An Eastern railroad has secured what amounts to fourth quarter coverage on 25,000 tons of bars, plates and shapes at 1.90c., but

in spite of that fact local mills are preparing to set up 2c., base, early next week as the fourth quarter price.

Higher prices generally are being asked on pig iron following the recent activity. Advances announced range from 25c. to 50c. a ton.

There continues to be much tension in the scrap situation, owing to the fact that almost all melters want supplies at the same time and in recent years it usually has been necessary to rotate deliveries that all might be supplied. This condition causes strong competition among dealers for the offerings and a very firm price situation.

Pig Iron.—The recent large sales have been followed by a general advance in quotations. Most producers now want \$17, Valley furnace or Valley furnace base, for No. 2 foundry, while basic iron is held at \$16.25 to \$16.50, Bessemer, at \$17.25 to \$17.50 and malleable at \$17.25. For the most part, however, the new quotations are asking rather than sales prices. Small sales of foundry iron are reported at \$17 for the base analysis, but there are still some outstanding quotations on fairly large lots of \$16.50. Some producers have refused bids of \$16 for basic iron, but no sales have

come to light at a higher price. A price of \$17.25 is supported by only a few sales, the largest of which was 200 tons. There was one sale of 100 tons of malleable iron at \$17.25. So many of the large requirements of this district were covered in the past week or two that dependence of producers for additional tonnage is entirely upon the small melters. The higher prices now sought have not been out long enough to have been given much of a test or to have become fully established. W. P. Snyder & Co. make the August average prices of Valley basic and Bessemer iron the same as those of the month before, or \$16 and \$17 respectively.

Prices per gross ton, f.o.b. Valley furnace:

Basic	\$16.00 to \$16.50
Bessemer	17.00 to 17.50
Gray forge	16.25 to 16.75
No. 2 foundry	16.50 to 17.00
No. 3 foundry	16.25 to 16.75
Malleable	17.00 to 17.25
Low phos., copper free....	26.50

Freight rate to Pittsburgh or Cleveland district, \$1.76.

Ferroalloys.—Consumers still are specifying freely against contracts for the commonly used ferroalloys. Some of the steel companies are finding it necessary to increase their releases of ferromanganese, since the rate of steel works operations is higher than they had expected. The movement of ferrosilicon also is heavy. New business is light. Prices are unchanged.

Semi-Finished Steel.—Almost all makers of sheet bars have announced a fourth quarter price of \$33, Pittsburgh and Youngstown, but as yet nothing has been said authoritatively as to the contract price for that period on billets and slabs. It is known that several producers are dissatisfied with the present contract price of \$32 and would like to add \$1 or \$2 a ton to the price for the final quarter of the year. Delay in making an announcement as to the price is probably accounted for by the fact that the proposed chemical extras will mean higher prices for the steel for a good many strip specifications, and it is yet to be determined whether non-integrated strip manufacturers can secure sufficient advance on the finished product to enable them to pay more for the semi-finished steel. The record of many years discloses that the prices of sheet bars, billets

and slabs are governed by the prices of the finished products rather than the reverse. Some spot sales of billets, including one for Eastern shipment of 300 tons, are noted at \$33, Pittsburgh. Wire rods are being specified quite actively. Most makers have announced \$42, base, Pittsburgh or Cleveland, as the fourth quarter price.

Bars, Plates and Shapes.—Makers still report heavy specifications on third quarter contracts, and because it looks as if obligations for this quarter will have been pretty well liquidated by the end of the month, some manufacturers already have announced an intention to make 2c., base Pittsburgh, their minimum price on Sept. 10. Specifications on third quarter contracts must be in by that date or the tonnage unspecified will be cancelled. The stage is being set for a highly interesting contest. The new price means an advance of \$3 a ton over the ruling contract price for this quarter and an even steeper advance over what preferential buyers have been called upon to pay. Full specifications are likely to mean some accumulation of stocks by consumers in trying to delay paying the advance. The fact that an Eastern railroad has been covered for the remainder of the year at 1.90c. is not considered helpful to setting 2c., base, as the final quarter price.

Rails and Track Supplies.—Except for the inquiry of the Chesapeake & Ohio Railroad for 45,000 tons of standard-section rails, there is little of interest in rail and track supplies. It is expected that, as usual, the C. & O. rail business will go to Chicago mills. Spikes, bolts and tie plates are moving on old orders, but new business is very light. Light-section rails are slow.

Wire Products.—Business is making a satisfactory showing compared with this time last year, and while prices are irregular in some consuming centers in which competition converges more sharply than in others, the more general condition is of marked firmness.

Tubular Goods.—It is said here that if all the pipe line projects that have been discussed recently materialize into actual orders, they will be nearer

3000 than 1500 miles. But there are a good many pipe lines that never get beyond the conversational stage, because of the huge investment those of considerable length involve, to say nothing of the securing of rights of way and of franchises for the sale of gas in municipalities. Spang, Chalfant & Co., Inc., has taken 45 miles of 18-in. pipe for the gas line of the Memphis Natural Gas Co., which recently awarded the National Tube Co. 218 miles of the same size of pipe for the Fowler, La.-Memphis line. The former also has taken 66 miles of 10-in. seamless pipe for the Arkansas Natural Gas Co., amounting to 7600 tons. There is still a good demand for seamless casing and drill pipe from the Santa Fe Springs, Cal., field and some makers have six to eight weeks' business on their books, chiefly for that field. Welded oil country pipe is slow and fall heating demands have not yet begun to show in the demand for butt welded sizes.

Sheets.—With the exception of 1917, one of the years of the World War, August shipments of sheets by the American Sheet & Tin Plate Co. were the largest on record. The reports by independent companies, though less specific, suggest that they also enjoyed an unusually active August in shipments. The answer is found in the unusually high summer rate of operation of several of the larger consuming industries, coupled with the fact that sheets can be stocked, and many distributors and consumers have considered it an economy to do so to get the advantage of 2 per cent cash discount, which all sheet manufacturers have announced will be replaced by one of one-half of 1 per cent, effective Oct. 1 next. Higher prices recently announced appear to be in a fair way of being deferred by the willingness of mills to take more business than can be shipped this month at the prices ruling on third quarter tonnages.

Tin Plate.—Makers are beginning to reach the end of their orders for tin plate for packers' cans and some recession in mill operations already is noted. As against substantially full physical operations, or approximately 90 per cent of capacity, for the past four months, mill engagement has

Carbon Vanadium.....	0.95	3.70

Above prices are for hot-rolled steel bars, forging quality. The ordinary differential for cold-drawn bars is 1c. per lb. higher. For billets 4 x 4 to 10 x 10 in., the price for a gross ton is the net price for bars of the same analysis. For billets under 4 x 4 down to and including 2½ in. squares, the price is \$5 a gross ton above the 4 x 4 billet price.

Slabs with sectional area of 16 in. or over carry the billet price; slabs with sectional area of 12 in. to 16 in. carry a \$5 extra above the billet price and slabs with a sectional area under 12 in. carry the bar price.

Band sizes are 40c. per 100 lb. higher.

Rails

Per Gross Ton

Standard, f.o.b. mill.....	\$43.00
Light (from billets), f.o.b. mill.....	36.00
Light (from rail steel), f.o.b. mill.....	34.00
Light (from billets), f.o.b. Ch'go mill.....	36.00

Plus differentials for lengths over 18 ft. and for commercial exact lengths. Warehouse discounts on small lots are less than the above.	

fallen to about 75 per cent. All indications, however, point to the year being larger than 1927 in both production and shipments. The downturn in mill operations last year occurred in July, and shipments for the year to date are equal to the production for two to three weeks later in 1927. Mill operations are likely to hold at or at worst only slightly under the present rate over much of the remainder of the year, as general line tin plate demands promise to be up to the average, and in November and December there will be some production against early 1929 requirements.

Cold-Finished Steel Bars and Shafting.—There seems to be no appreciable decline in the requirements of the automotive industry as measured by the specifications from that industry. There are too few consumers or distributors who are not covered for this quarter for new business to amount to much; consequently, the higher price announced three weeks ago has not yet become very well established as a sales price. It is expected that books will be opened for fourth quarter business soon and the impression exists that the price will be 2.20c., base Pittsburgh or Chicago.

Reinforcing Steel Bars.—Mills in this area have made a change in the mode of quoting, and on mill shipments now are naming 1.90c., base, for stock or random lengths and 2.15c. for cut lengths.

Hot-Rolled Flats.—Business is really good in strips, some makers finding August bookings to have gone as much as 35 per cent ahead of those in the month before. But the satisfaction over orders is lessened by the fact that the effort to obtain higher prices is not meeting with success. After books had been opened for fourth quarter tonnages and higher prices named, it developed that some of the large consumers had been previously covered for the remainder of

the year at the same prices that ruled in the third quarter.

Cold-Rolled Strips.—The recently announced fourth quarter price of 2.85c., base Pittsburgh, for lots of 3 tons or more appears more likely to apply on small than large-lot business. The large consumers, at least, are being given an opportunity to add some tonnage to third quarter contracts. This may partly explain the common report of good business, although it may also be due to the fact that the automobile and truck production schedules for this month call for 400,000 units, and there is a good deal of anxiety for shipments of steel, since few car builders expect sales to be as good 60 days from now as at present. Ford production is gaining and this means an increasing demand for strips and sheets, which the Ford company does not produce itself.

Bolts, Nuts and Rivets.—Demand is fairly active, but no tax upon the country's productive capacity. Prices generally are firm, but there are reports that \$2.90, base, per 100 lb. on large rivets is more of a small than a large-lot price.

Coke and Coal.—Light supplies rather than a big demand are responsible for continued firmness in spot beehive oven furnace coke prices. The price also gains some help from the fact that the demand for coke for household purposes is beginning to expand and this provides an outlet for coke that might otherwise seek an outlet for metallurgical uses. There is plenty of spot foundry coke. The coal market still is easy under abundant offerings. On account of larger demands for household coal, the supply of slack is on the increase and prices are weaker on that grade.

Old Material.—The market is very firm, but no higher than it was a week ago, except on sheet scrap and on the railroad specialties. There has been moderate buying of the latter by steel foundries, which are finding deliveries on old orders insufficient for their present needs. Rolled steel wheels have been sold at \$17.50 and dealers want the same price for couplers and knuckles and coil and leaf springs. Dealers who are short of heavy melting steel are bidding from \$15.50 to \$16.25, depending upon the destination, but none would take a new order for railroad grade at less than \$16.50, if, indeed, they would sell at that price. The awarding of the Pennsylvania Railroad scrap late this week is awaited with unusual interest, because offerings from other sources are light on account of the common impression among producers that the market has not yet gone as high as it will go. A very strong market exists in blast furnace scrap, particularly short shoveling steel turnings in the Youngstown district, where on actual deliveries of the latter \$13 to \$13.50 has been paid. Steel companies there, anxious to increase pig iron production without putting on blast furnaces, have been charging

short steel turnings and have found it necessary to go well above the market to get supplies. The September scrap list of the Norfolk & Western contains approximately 5000 gross tons. As much as \$16.75 is reported to have been paid for compressed sheets by a local steel maker who bought in Detroit. First quality heavy melting steel is so scarce that the next choice of melters is compressed sheet scrap and again the condition here is that the two grades command the same prices. The September scrap list of the Baltimore & Ohio Railroad amounts only to 7164 gross tons.

Prices per gross ton delivered consumers' yards in Pittsburgh and points taking the Pittsburgh district freight rate:

Basic Open-Hearth Grades:		
Heavy melting steel.....	\$15.50 to	\$16.50
Scrap rails	15.00 to	16.00
Compressed sheet steel....	15.50 to	16.50

Rails 3 ft. and under.....	16.50 to	17.00

Exports of agricultural implements from the United States in the first half of 1928 were larger than in any previous six months' period. Shipments to Canada had never been equaled in any similar period, according to the Agricultural Implements Division, Department of Commerce. Total shipments to Canada during the first six months amounted to \$23,418,598, which was 43 per cent of the shipments to all countries. Argentina was the second largest buyer.

The western Massachusetts branch of the National Metal Trades Association, the Springfield Chamber of Commerce, and the Springfield chapter of the American Society for Steel Treating have combined to make available this fall a course in the treatment of steel. The course will comprise six lectures by Professor John F. Keller, Purdue University, will be illustrated, and delivered in the assembly room of the Chamber of Commerce. The first lecture will be given Thursday evening, Sept. 6.

Chicago

Steel Buying and Contract Specifications Continue at High Rate—Pig Iron Demand Increases

CHICAGO, Sept. 4.—Buyers in the Chicago district continue to issue heavy drafts against past commitments and to make liberal purchases for their needs in the near future. New sales, the bulk of which are for delivery at the earliest convenience of mills, are the largest since June 22 and compare favorably with the seven-day period ended March 23. Specifications, reflecting the more rapid pace of industry and the desire of buyers to take full advantage of present prices, are heavier than in any week since March 23. Fourth quarter purchases at a \$2 a ton advance are more numerous but are individually small and have not afforded a real test of the market. Total sales and specifications for plates, bars and shapes for August topped the aggregate for July by a fair margin.

No. 10 furnace at Gary has been banked, leaving the leading producer with 15 stacks in blast. For the district as a whole 24 steel mill furnaces out of 36 are active. Notwithstanding that furnace operation has been curtailed, ingot output remains at 80 per cent of capacity. Increased use of scrap and larger production by individual furnaces account for the apparent discrepancy between furnace output and ingot tonnage.

Building permits have declined 10 per cent in Chicago since July. Awards for the Patterson Estate Building and the plant for the United States Gypsum Co., requiring a total of 5000 tons, may be let this week.

The Chicago, Burlington & Quincy has ordered 5200 tons of rails from the Colorado Fuel & Iron Co.

Pig Iron.—The recent advance of 50c. a ton on Northern foundry iron appears to have had no retarding effect on purchasing, total bookings for the week being comparable with those of the previous seven-day period, after taking into account the Monday holiday. No. 2 iron is firm at \$18 a ton, local furnace, and it is said that another 50c. advance is in the offing. The No. 4 Iroquois furnace will be blown in Sept. 6 and the second Federal stack will be put in service as soon as repairs are completed, probably in a week or 10 days. There are now in blast the Zenith, one Federal and three Iroquois furnaces. The rising demand for pig iron and the reduced stocks in the hands of sellers are the causes underlying the increase in the rate of output. The ratio of spot sales to total sales in August was the largest for any month on record. This is a reflection of the rapid pickup in foundry operations. Total shipments in August ran 10 per cent above those of July, which was a record month.

Prices per gross ton at Chicago:

N'th'n No. 2 fdy., sil. 1.75 to 2.25	\$18.00
N'th'n No. 1 fdy., sil. 2.25 to 2.75	18.50
Malleable, not over 2.25 sil.	18.00
High phosphorus	18.00
Lake Super. charcoal, sil. 1.50	27.04
So'th'n No. 2 fdy. (all rail)	22.26
So'th'n No. 2 (barge and rail)	21.76
Low phos., sil. 1 to 2, copper free	\$28.50 to 29.00
Silvery, sil. 8 per cent	29.79
Bess. ferrosilicon, 14-15%	46.79

Prices are delivered consumers' yards except on Northern foundry, high phosphorus and malleable, which are f.o.b. local furnace, not including an average switching charge of 61c. per gross ton.

Ferroalloys.—This market is quiet in new sales. Specifications are steady and prices are unchanged.

Prices delivered Chicago: 80 per cent ferromanganese, \$112.56; 50 per cent ferrosilicon, \$83.50 to \$87.50; spiegel-eisen, 19 to 21 per cent, \$40.76.

Plates.—This has been a quiet week for large sales of plates, but miscellaneous orders bulk heavy from a wide variety of users. Specifications and new orders from the car builders are light, covering only needs for small orders of new equipment and miscellaneous repair work. Shipments to pipe makers remain large and prompt delivery is being urged. Oil storage tank programs, though under way, are slow in reaching the stage where prices will be asked for plate requirements. Universal mills are moderately busy. Plate mills are engaged at close to 80 per cent of capacity. Deliveries range from two to five weeks. Prices for delivery to Oct. 1 are steady at 2c., Chicago. A few scattered orders for delivery in the last quarter have been booked at 2.10c. a lb., Chicago.

Mill prices on plates, per lb.: 2c. base Chicago.

Structural Material.—Structural awards in the last week totaled over 8000 tons. The American Bridge Co. has taken 3000 tons for a bridge across the Mississippi River at Quincy, Ill., and 1000 tons for a railroad bridge at Byron, Ill. A Milwaukee shop will fabricate 1900 tons for a new mill building for the Interstate Iron & Steel Co., Chicago, and 1300 tons for a Methodist Hospital in Indianapolis will be fabricated in an Indianapolis shop. This week has brought awards of a fair number of small jobs, serving to round out shop schedules which are overbalanced on the side of heavy tonnage orders. The pending list in this district is impressive but it is quite noticeable that many new projects are dragging. In recent weeks fabricators have raised prices from \$6 to \$8 a ton on large inquiries. In some quarters it is believed that on many projects this move has placed architects and contractors in an awkward position for the reason that asking prices by the shops are now greater than the figures used in laying these projects before the promoters. At the moment fabricators are taking a firm stand for the higher prices. Shipments are

heavy from mills to fabricators and to miscellaneous users of shapes. Deliveries range from two to five weeks. Scattered lots have been taken at 2.10c. a lb., Chicago, for delivery in the fourth quarter.

Mill prices on plain material, per lb.: 2c. base, Chicago.

Bars.—Bar mill products are in heavy demand and output averages close to 85 per cent of capacity. Deliveries of soft steel bars are slowing up under the influence of heavy specifications in recent weeks. Additions to farm implement manufacturing plants are being put in production, and steel requirements are on the increase, especially for the manufacture of tractors. Shipments to road machinery builders are steady, as this industry gives further evidence of having readjusted its plan of production, so that its need for steel is no longer influenced in any marked degree by the seasonable demand for its product. Forging plants in this district are extremely busy. Mild steel bars are firm at 2c. a lb., Chicago, for delivery prior to Oct. 1. Chicago producers have adopted the \$2 a ton advanced on alloy steel bars. Output by local mills is steady and specifications indicate a sustained rate of production well into September. Rail steel bar producers have not officially opened books for the fourth quarter, but it is generally conceded that final period contracts, if offered now, would be taken at 1.85c. a lb., Chicago Heights, which is the price unchanged that has held in the third quarter. Specifications are equal to production, which continues on a double turn basis. Rail steel reinforcing bars are drawing heaviest against mill output.

Mill prices per lb.: Soft steel bars, 2c., base, Chicago; common bar iron, 2c., base, Chicago; rail steel bars, 1.85c., base, Chicago Heights mill.

Sheets.—Specifications for sheets are unusually heavy and deliveries are lengthening, the range now being from four to five weeks on all grades. Hot mills, though scheduled full are not able to produce above 85 per cent of capacity, partly because of the character of orders and partly owing to hot weather. The holiday this week has cut output and producers expect loss of production in the first two weeks of September, during which time hot weather usually prevails. The rush for deliveries against third quarter contracts, with the resulting delays in deliveries, leaves sellers with no alternative but to send out after Oct. 1 many invoices carrying the 2 per cent discount. This practice will be followed, it is said, only on old contracts and on new business which is fully specified and on which delivery cannot be made prior to Oct. 1. Contracts made now for delivery as specified over the fourth quarter will be invoiced 30 days net or one-half of 1 per cent for cash in 10 days. Future buying is light because purchasers in taking advantage of present contracts will accumulate tonnage above immediate requirements and thus in many cases will take their

needs from stock in October and possibly in November.

Base prices per lb., deliv'd from mill in Chicago: No. 24 black sheets, 2.80c. to 2.90c.; No. 24 galv., 3.65c. to 3.75c.; No. 10 blue ann'l'd, 2.15c. to 2.25c. Deliv'd prices at other Western points are equal to the freight from Gary plus the mill prices, which are 5c. per 100 lb. lower than Ch'go deliv'd prices.

Cast Iron Pipe.—A seasonable dullness has settled over the cast iron pipe business. Most municipalities have completed their programs for the season. Contractors who have been unusually busy during the past five months are now anxious to take extra work that will keep them occupied until cold weather. Buying for winter manufacture is still two months away and so promises nothing in the way of adding life to this market. Several railroads have taken small lots through manufacturers of water treating plants, and public utilities are finding needs for a few car lots. The American Cast Iron Pipe Co. has taken 500 tons of 6, 8 and 10-in. pipe for Highland Park, Ill. Centerline, Mich., will receive bids up to Sept. 11 on 200 tons of 6 and 8-in. pipe. Prices remain steady at \$34 to \$35, Birmingham, for 6-in. diameters and larger, or \$42.20 to \$43.20 delivered Chicago. Deliveries are improving, some sizes now being offered for prompt shipments. Stocks of pipe at foundries are a trifle smaller than a year ago at this time.

Prices per net ton, deliv'd Chicago: Water pipe, 6-in. and over, \$42.20 to \$43.20; 4-in., \$46.20 to \$47.20; Class A and gas pipe, \$4 extra.

Wire Products.—Spring terms on woven wire fencing for the Southern trade were announced Sept. 3. Producers also set that date for the opening of fourth quarter books at unchanged prices. Demand for nails is of moderate proportions but fully up to expectations at this time of year. Jobbers in the South and Middle West are buying more liberally, but in the Northwest, where the harvest season is not so far advanced, business is comparatively light. The character of orders from distributors leads to the opinion that their stocks are light.

Cement c't'd nails, base per keg.....	3.10

Wire mills continue to operate at 65 per cent of capacity and at that rate are building stocks slowly. A few scattered contracts, placed this week, foretell the opening of the fall trade, which should be well under way in the next 15 days. Orders from the manufacturing trade appear not to have diminished in total volume. In fact, in a few industries requirements have increased a trifle. Prices for wire and wire products are given on page 595.

Old Material.—Prices for a number of specialties continue to move upward. Steel mills, the purchasers of heavy tonnage grades, are well covered on requirements and there is no easing in the rigidity of inspections. The short position of dealers is forcing them to pay higher prices to the railroads. At a closing this week a railroad obtained \$20.50 per gross ton on track for iron arch bars and \$16.50 per gross ton for steel angle bars. Demand for cast iron wheels is light except from small users. Malleable foundries are busy, and while not making large purchases, they are entering the market freely for current requirements. Steel mills are rejecting offers of heavy melting steel at \$13.25 a gross ton, delivered.

Prices deliv'd Chicago district consumers: Per Gross Ton

Basic Open-Hearth Grades:	
Heavy melting steel.....	\$12.75 to \$13.25

*Relaying rails, including angle bars to match, are quoted f.o.b. dealers' yards.	

Rails and Track Supplies.—Purchases of standard-section rails in the last week have been confined to scattered and small lots, but releases to mills are affording a steady rate of output. Rolling schedules late this summer have not given producers an opportunity to overhaul equipment, a move which usually comes at this time of the year. It is reported that several large buyers have fall rail programs well under way and in some quarters an early buying movement is expected. Orders for light rails are small in the aggregate. Shipments of track supplies are in smaller volume.

Prices f.o.b. mill, per gross ton: Standard-section open-hearth and Bess. rails, \$43; light rails, rolled from billets, \$36. **Per lb.:** Standard railroad spikes, 2.80c.; track bolts with square nuts, 3.80c.; steel tie plates, 2.15c.; angle bars, 2.75c.

Reinforcing Bars.—Following several weeks of light awards, over 2000 tons of reinforcing bars has been placed. Outstanding among new contracts in Chicago are 900 tons for the Sheridan Towers Building and 800 tons for a flume on Western Avenue. Awards this week are well scattered among fabricators and will serve to sustain shop operations, which were tending to taper following heavy shipments against old orders. Fresh inquiry in Chicago includes 600 tons or more each for a hotel, two apartment buildings and a store and office building. The Waltonian, a new \$5,000,000 hotel project for Chicago's north side, is being designed for reinforced concrete construction. The price situation is not clearly defined except that quotations lean toward the weak side. New contracts and fresh inquiry are shown on page 611.

Warehouse Business.—August sales have mounted well above the total for the same month a year ago. Quotations on all commodities are steady. Warehouses and jobbers of steel sheets and cold-rolled strip are closely watching efforts of mills to establish on Oct. 1 discounts of one-half of 1 per cent in 10 days instead of 2 per cent. Warehouses are considering passing this reduction in discount along to their customers.

Bolts, Nuts and Rivets.—Although definite announcement has not been made concerning fourth quarter prices, it is the general impression here that there will be no changes. Specifications are steady and the industry continues to operate at 65 per cent of capacity. Last quarter contracts may be offered to buyers the early part of next week.

Coke.—Shipments of this commodity are growing heavier as the melt of pig iron in this district expands. Prices are firm at \$8, f.o.b. local ovens, and \$8.75, delivered in the Chicago switching district.

The Interstate Commerce Commission has found justification for the cancellation of rates on car material from Chicago to the St. Louis territory, Mount Vernon, Ill., and Bettendorf, Iowa, except on carwheels and car axles. New tariffs will be published on or before Sept. 14.

Philadelphia

About 50,000 Tons of Pig Iron Bought in 10 Days—Steel Deliveries Slightly Extended

PHILADELPHIA, Sept. 4.—Pig iron has been decidedly active and total purchases of foundry and basic iron in this district during the past 10 days are estimated at 40,000 to 50,000 tons. Iron and steel scrap prices show a further upward trend, but consumers have not yet made any sizable contracts at the higher prices brokers are asking. Mill deliveries on bars, plates and sheets are becoming extended, ranging from 10 days to three weeks, contrasting with four to five-day deliveries less than a month ago. Buyers have not yet shown much interest in contracts on bars and plates for fourth quarter, but sheet mills have booked some fair tonnages covering last quarter requirements, but specified for September delivery, so that the buyer may take advantage of the present 2 per cent discount for cash in 10 days.

Pig Iron.—Practically all eastern Pennsylvania users of basic iron have covered or are about to close on tonnage estimated to be sufficient for their requirements for a large part of the next quarter. A Pottsville consumer has taken about 7500 tons, a Claymont, Del., mill about 6000 tons, a Phoenixville user about 1200 tons, a Trenton, N. J., company about 1000 tons and a Coatesville consumer is about to close on 12,000 to 15,000 tons. On these purchases the current range of \$18.75 to \$19.25 per ton, delivered, is understood to have applied. A large number of the small foundry iron users in this district, expecting advances before the end of the next quarter, have covered at least part of their requirements, buying 300, 500 and as much as 1000-ton lots for delivery in the next few months. One contract for fourth quarter called for 2500 tons of foundry iron. Furnaces are now asking \$20 per ton, base, for fourth quarter delivery, but the recent buying movement was at \$19.50 per ton and there are still outstanding quotations at this price. The Virginia producer will blow out its furnace about Sept. 21, with about 50,000 tons of iron on its yard. The blast furnace, ore mines and coal mines are included in the suspension. The Brooke furnace, Birdsboro, Pa., which has been out of blast for rebuilding, is scheduled to go into blast at the end of this month. There has been some heavy buying of low phosphorus, the Lorain Steel Co., Johnstown, Pa., closing on about 3000 tons of the copper-free grade.

Prices per gross ton at Philadelphia:

East. Pa. No. 2, 1.75 to 2.25 sil.	\$20.26
East. Pa. No. 2X, 2.25 to 2.75 sil.	20.76
East. Pa. No. 1X.	21.26
Basic (del'd east. Pa.)	\$18.75 to 19.25
Gray forge	19.75 to 20.25
Malleable	21.00 to 21.50
Stand. low phos. (f.o.b. N. Y. State furnace)	22.00 to 23.00
Cop. b'rg low phos. (f.o.b. furnace)	23.00 to 23.50
Va. No. 2 plain, 1.75 to 2.25 sil.	25.54
Va. No. 2X, 2.25 to 2.75 sil.	25.04

Prices, except as specified otherwise, are deliv'd Philadelphia. Freight rates: 76c. to \$1.64 from eastern Pennsylvania furnaces; \$4.54 from Virginia furnaces.

Ferromanganese.—Requisitions for shipments on contracts are large, and as some consumers are not fully covered for the last half, some additional buying is expected to develop before

long. The price is firm at \$105 per ton, seaboard.

Bars.—Specifications against contracts have been heavy, and for the first time in many months mills are in some instances able to close rolling schedules as far ahead as a fortnight. New business for prompt shipment is small, but quotations are developing firmness at 1.90c. per lb., Pittsburgh, which will apparently be the fourth quarter contract price, at least to preferred buyers, with 2c., Pittsburgh, the small-lot price.

Plates.—Mills are fairly well booked with tonnage and deliveries range from 10 days to two weeks, in contrast with four to five days less than a month ago. Local shipyards are bidding for the construction of two ships; one requiring 3700 tons of plates is for the W. R. Grace Steamship Co., another requiring 2500 tons is for the Di Giorgio Fruit Co. In each case the contract may be for two ships. Prices on plates are evidently firmer at 2.05c., Coatesville, although a large tonnage might bring out quotations \$1 a ton lower. For fourth quarter, 2.05c. to 2.15c., Coatesville, or 2.15c. to 2.25c., Philadelphia, are the prices considered by mills.

Shapes.—Prices still lack the strength exhibited by other products, but the volume of business is good and mills are well filled. A ship for the W. R. Grace Steamship Co. will require about 1500 tons of shapes and

†For 50 bundles or more; 10 to 49 bun., 4.95c. base; 1 to 9 bun., 5.30c. base.

one for the Di Giorgio Fruit Co. about 900 tons. Prices continue to range from 1.95c. to 2.05c. per lb., Pencoyd, Pa., or 2.01c. to 2.11c., delivered Philadelphia.

Sheets.—Most mills have plenty of tonnage on their books. A good volume of specifications has been received, partly on current contracts and partly on new contracts for fourth quarter requirements specified early so as to take advantage of the 2 per cent discount for cash in 10 days which expires Oct. 1. All producers have now adopted the new one-half of 1 per cent discount for cash in 10 days. For fourth quarter delivery, black sheets are quoted at 2.75c. and galvanized at 3.50c. to 3.60c. per lb., base Pittsburgh. Blue annealed sheets are firmer and for prompt or fourth quarter delivery 2c. to 2.10c., Pittsburgh, applies with most mills. While 2c. is apparently the level for the next quarter on blue annealed sheets up to 45 in. wide, which encounter competition from continuous sheets, it is suggested that on 45-in. and wider the present extra of 10c. per 100 lb. may be increased.

Warehouse Business.—Jobbers in this district have advanced prices on cold finished steel \$2 a ton to 3.45c. per lb. on rounds and hexagons and to 3.95c. per lb. on squares and flats.

Imports.—In the week ended Sept. 1, 1200 tons of pig iron arrived at this port, 800 tons from India and 400 tons from the Netherlands. Iron ore arrivals totaled 7400 tons, all from Algeria. Steel imports consisted of 422 tons of structural shapes, of which 264 tons came from Belgium, 128 tons from France and 30 tons from Germany; 1002 tons of steel bars from France and 50 tons of hoops and bands from the United Kingdom.

Old Material.—Buying by eastern Pennsylvania consumers is still light, but dealers and brokers are paying higher prices to fill contracts. Users are apparently delaying further obligations until they have received delivery on their present contracts at lower than present asking prices. Stove plate is quoted at \$11.50 to \$12 per ton, delivered.

Prices per gross ton delivered consumers' yards, Philadelphia district:

No. 1 heavy melting steel.	\$13.00
Scrap T rails	12.50
No. 2 heavy melting steel.	\$11.00 to 11.50

New York

Large Buyers May Get Plates, Shapes and Bars for Fourth Quarter at 1.90c.

NEW YORK, Sept. 4.—In another active week pig iron bookings by local selling offices totaled 15,000 tons. Both large and small buyers are covering at least part of their last quarter needs. Recent purchases by the American Radiator Co. for its Eastern plants total 31,000 tons. Much of the large-tonnage business was closed prior to the recent advance in prices at Buffalo. An inquiry from the Central Foundry Co. for 6000 tons for its Dundalk, Md., plant is still pending, but is expected to be closed shortly. Other business actively before the trade totals 2000 to 3000 tons. New inquiries are preponderantly for relatively small tonnages. Small foundries, accustomed to limit their purchases to spot requirements, are placing fourth quarter contracts. Although there are still a few outstanding quotations on foundry iron at \$16, base Buffalo, the minimum price on new inquiries is \$16.50 and some orders are being taken at \$17. On malleable iron, one Buffalo producer is quoting \$17.50, furnace. Eastern Pennsylvania foundry iron is also stronger, following advances of 50c. a ton announced by two producers. While rising prices have doubtless driven in considerable business, there are also evidences of increasing melt in this district. The Lorain Steel Co., Johnstown, Pa., has closed for a round tonnage of low phosphorus, and there have been other sizable purchases of that grade. A New York producer of low phosphorus contemplated shipping by rail to Albany, N. Y., and thence by barge to various Great Lakes and seaboard points.

Prices per gross ton, delivered New York district:

Buffalo No. 2 fdy., sil.	1.75 to 2.25	\$21.41 to \$21.91
*Buf. No. 2, del'd east.		
N. J.	19.78 to 20.28	
No. 2, del'd east. N. J.

East Pa. No. 2 fdy., sil.	1.75 to 2.25	20.39 to 21.52
East Pa. No. 2X fdy., sil.	2.25 to 2.75	20.89 to 22.02
East Pa. No. 1X fdy., sil.	2.75 to 3.25	21.39 to 22.52

Freight rates: \$4.91 from Buffalo, \$1.39 to \$2.52 from eastern Pennsylvania.
*Price delivered to New Jersey cities having rate of \$3.28 a ton from Buffalo.

Plates, Shapes and Bars.—Indications now point to the likelihood that large or preferential buyers of plates, shapes and bars will not be asked to pay higher than 1.90c., Pittsburgh, on fourth quarter contracts. Very little, if any, contracting has been done, but some buyers have been sounding out the mills to learn their attitude in view of the frequent reports that 2c. is to be the fourth quarter price. It is probable that the smaller buyers will be asked to pay 2c., or a \$2 a ton premium, but as similar efforts in the past have not been wholly successful the outcome of the present undertaking will be watched with interest. The uppermost topic

of discussion between buyers and sellers this week is not fourth quarter prices, however, but the Sept. 10 closing date for specifications against third quarter contracts. Not all steel companies inserted this clause in their

contracts, but those that did so are engaged in urging customers to get in specifications before the final date and are giving notice that all unspecified tonnage will be cancelled. The effect of this is expected to be very heavy specifications this week and the early part or next week. Some buyers probably will overspecify against their contracts, in which case the mills may have sufficient tonnage on their books to carry them well into October. There has been a fairly steady increase in the volume of specifications since Aug. 1. In keeping with higher asking prices for structural shapes, fabricated steel prices are working toward higher levels. In some quarters it is expected that the money situation may have a tendency to curb building operations. The total of building awards for the first eight months of the year was 8 per cent ahead of the corresponding period of 1927, but in August there was a falling off of 11 per cent compared with the figure for August, 1927. New construction contemplated but for which no awards have been made increased slightly during the last week of August. The principal structural steel awards of the week were 6200 tons for the Pennsylvania-Lehigh Valley railroad bridge over Newark Bay and 4500 tons for an office building at Herald Square, New York.

Mill prices per lb., deliv'd New York: Soft steel bars, 2.19c. to 2.24c.; plates, 2.17½c. to 2.22½c.; struct. shapes, 2.14½c. to 2.19½c.; bar iron, 2.14c.

Reinforcing Bars.—No sizeable awards have been reported during the last week, but the volume of small orders continued satisfactory. A large aggregate tonnage is pending, and among the large projects which have come out recently are a plant for the Brooklyn Ash Removal Co., Inc., in Brooklyn, requiring 500 tons, and a Packard automobile service station in Manhattan, which will take a considerable tonnage. Prices are unchanged, but the Pittsburgh mill warehouse price of 2.15c. per lb. is expected to be advanced \$2 a ton in the near future.

Cast Iron Pipe.—Business has not been active during the last week, but there is considerable work in prospect. Bids have been taken on 150 tons of 4 to 8-in. Class C pipe for Camp Devens, Ayer, Mass. Southern makers continue to quote \$34 to \$35 per ton, Birmingham, but these prices are too high to compete with Northern producers, who are quoting about \$37.60 per ton, delivered New York, and occasionally lower.

Prices per net ton, deliv'd New York: Water pipe 6-in. and larger, \$35.60 to \$37.60; 4-in. and 5-in., \$40.60 to \$42.60; 3-in., \$50.60 to \$52.60; Class A and gas pipe, \$4 to \$5 extra.

Sheets.—The fact that the reduction of the cash discount from 2 per cent to one-half of 1 per cent goes into effect Oct. 1, together with the clause in many sheet contracts requiring buyers to specify third quarter tonnage in full by Sept. 10, is expected to bring heavy specifications to local selling offices this week. On some full-finished sheets, such as metal furni-

ture sheets, the mills cannot promise deliveries before October, and in such cases contract buyers will get the 2 per cent discount regardless of the time shipment is made. On new business, however, which cannot be produced or shipped this month, the new discount rate will apply. Ordinary sheets can be shipped by most mills in two weeks, but deliveries of three to five weeks are quoted on the special finishes.

Warehouse Business.—Effective Sept. 1, jobbers in this district advanced cold finished shafting and screw stock 10c. per 100 lb. to 3.50c. per lb., base, for rounds and hexagons and 4c., base, for flats and squares. Business has been increasing, particularly in black and galvanized sheets, orders for which are larger and more numerous.

Coke.—Furnace coke prices continue to show strength and this tendency is reflected to a somewhat lesser degree in foundry coke. A healthy increase in demand is noted and it is sometimes difficult to get spot shipments when desired. Furnace coke is quoted at \$2.75 to \$3 per ton, Connellsville, and the standard foundry grade at \$2.75. Special brands of foundry coke are firm at \$4.85 per net ton, ovens, and delivered prices are \$8.56 per ton, to northern New Jersey, Jersey City and Newark, and \$9.44, to New York and Brooklyn. By-product foundry coke prices are unchanged at \$9 to \$9.40, Newark or Jersey City, and \$10.06, New York or Brooklyn.

Old Material.—Prices of all grades still show a strong upward tendency. Dealers and brokers are buying material at advances to cover old contracts and to add to stocks in the belief that a generally higher market level is de-

veloping. No. 1 heavy melting steel is still being bought at \$13 per ton, delivered eastern Pennsylvania, or \$10.35 per ton, New York, but for shipment to Weirton, W. Va., and Butler, Pa., some brokers are offering up to \$10.70 per ton, New York, to which is added a \$5.30 per ton freight rate to destination. Yard grade of heavy melting steel ranges from \$10.75 per ton, delivered to a Pottsville, Pa., consumer, to \$11.75 per ton, delivered to Harrisburg, Pa. Eastern Pennsylvania users of heavy melting steel are reported to have offered to buy additional tonnage at \$13 per ton, but brokers are not inclined to enter into contracts at this price in view of the increasing strength of all grades. Specification pipe is now being bought by brokers at \$13.50 per ton, delivered Lebanon, Pa., a further advance of 50c. per ton. Machine shop turnings have also been increased 50c. a ton.

Dealers' buying prices per gross ton, f.o.b. New York:

No. 1 heavy melting steel	\$10.35 to \$10.75
Heavy melting steel (yard)	7.25 to 8.00
No. 1 hvy. breakable cast	11.25 to 12.00
Stove plate (steel works)	7.75 to 8.25
Locomotive grate bars	7.75 to 8.25
Machine shop turnings	6.50 to 7.00
Short shoveling turnings	6.50 to 7.00
Cast borings (blast furn. or steel works)	6.00 to 6.50
Mixed borings and turnings	6.00 to 6.50
Steel car axles	16.00 to 16.50
Iron car axles	23.50 to 24.00
Iron and steel pipe (1 in. dia., not under 2 ft. long)	9.25 to 9.75
Forge fire	6.75 to 7.25
No. 1 railroad wrought	10.00 to 10.50
No. 1 yard wrot., long	8.00 to 8.50
Rails for rolling	10.50 to 11.00
Cast iron car wheels	12.00 to 12.50
Stove plate (foundry)	8.75 to 9.00
Malleable cast (railroad)	10.00
Cast borings (chemical)	10.75 to 11.25

Prices per gross ton, deliv'd local foundries:

No. 1 machy. cast	\$15.50 to \$16.00
No. 1 hvy. cast (columns, bldg. materials, etc.)	13.50 to 14.00
cupola size	13.00 to 13.50
No. 2 cast (radiators, cast boilers, etc.)	13.00 to 13.50

and inquiries having declined. However, Cleveland interests sold 40,000 tons in foundry and malleable iron during the week. Sales by these interests in August aggregated 310,000 tons. Considerable business was also taken during the early days of the buying movement in July. Sales in the past week included fewer large lots than during the few previous weeks. Most buyers are now covered for the remainder of the year. The tone of the market is very firm. Local prices are definitely established by several sales at the recent advance in prices to \$17 for foundry and malleable iron for outside shipment. One Lake furnace that recently advanced to \$17.50 is now getting \$18 for shipment to points where it has a freight advantage. In the Valley district prices are firmer. It is claimed that no more Valley foundry iron is available at \$16.50 and not much at \$16.75, the more common price being \$17. In Michigan, the price is unchanged at \$18, furnace. A Valley producer is attempting to get better prices for low phosphorus iron and sold 250 tons in the Pittsburgh district at \$27, a 50c. a ton advance. A 1000-ton lot in Chicago went to another producer. A Tennessee furnace has advanced Southern foundry iron 25c. a ton, putting it on the same \$16.25 basis as Alabama iron. The Lake steamer Henry Cort, which sailed from Cleveland last week with 3300 tons of pig iron for Milwaukee, went ashore during the trip, but it is believed that most or all of the cargo can be salvaged. The American Steel & Wire Co., Cleveland, blew out one Central furnace during the week.

Prices per gross ton at Cleveland:

N'th'n fdy., sil.	1.75 to 2.25	\$18.00
S'th'n fdy., sil.	1.75 to 2.25	22.25
Malleable		18.00
Ohio silvery, 8 per cent.		28.00
Basic Valley furnace	\$16.00 to	16.50
Stand. low phos., V'ley fur.	26.50 to	27.00

Prices, except on basic and low phosphorus, are delivered Cleveland. Freight rates: 50c. from local furnaces; \$3 from Jackson, Ohio; \$6 from Birmingham.

Iron Ore.—Shipments of Lake Superior ore were larger in August than during any previous month this year. The Lake movement last month amounted to 9,252,869 tons, an increase of 467,376 tons over that of the same month last year. Shipments to Sept. 1 were 32,517,693 tons, or 2,636,223 tons less than during the corresponding period last year.

Sheets.—Specifications have increased somewhat from the automotive industry and from other consumers. Mills are being crowded for

Steel Specifications Continue in Heavy Volume—Pig Iron Buying Movement Is Declining

CLEVELAND, Sept. 4.—Specifications for finished steel continue to come out in heavy volume. According to present indications a majority of third quarter contracts for steel bars, plates and shapes will be specified in full by Sept. 10, the last day that some mills will accept specifications for the current quarter. While some of the orders evidently are in anticipation of higher prices, most of the tonnage seems to be wanted for early consumption. New business is light. For current orders, the market is now well established at 1.90c., Pittsburgh, for steel bars and structural material. Plates are still available at 1.85c. Local mill prices on steel bars range from 1.85c. to 1.90c. Consumers are showing no interest in fourth quarter contracts. While outside mills have named 2c., Pittsburgh, as their price for that delivery for steel bars, plates and shapes, there is some belief that the market may become es-

tablished at 1.95c. for round lots with 2c. for small lots, or a \$2 a ton advance over the present quarter. Several of the Michigan automobile manufacturers have increased production on new models and are taking steel more liberally than a month ago. Activity in the building field has declined, there having been no awards or inquiries of any size during the week. A Detroit fabricator has taken an order for the erection of a factory building at Sao Paulo, Brazil, for the Fisher Body Corporation.

Semi-Finished Steel.—A local mill is quoting sheet bars, billets and slabs at \$33, Cleveland, for the fourth quarter. A Youngstown producer has named the same price at Youngstown. However, the market has not yet been tested by any sales. Specifications still tax the capacity of the local producer.

Pig Iron.—The buying movement appears to have passed its peak, sales

shipments of auto body sheets and some cannot promise deliveries before the middle of October. As consumers are showing no interest yet in fourth quarter contracts, there has been no test of the higher prices named for that delivery. For current orders, prices are unchanged at a minimum of 2.65c., Valley, for black, 3.40c. for galvanized and 1.90c., Pittsburgh, for blue annealed.

Strip Steel.—Irregularities that have existed in prices on hot-rolled strip will continue during the fourth quarter. Most producers are naming to their regular trade for the fourth quarter the prices that prevailed during the present and second quarters and contracts are being closed on that basis, or a maximum of 1.85c., Pittsburgh, for strip 6 to 12-in. wide. To other buyers the higher prices recently named are being quoted. Specifications are heavy. Most producers have named 2.85c., Cleveland, on cold-rolled strip for the last quarter. However, the market has not yet been tested and there is some indication that 2.75c. may be named for round lots. Fender stock has been advanced \$3 a ton to 4.25c. for No. 20 gage. Buyers are not yet showing interest in contracts.

Reinforcing Bars.—Inquiry is light, being confined to small lots. Warehouse prices on billet steel bars are irregular, 2.25c. being the usual maximum. Rail steel bars are unchanged at 1.75c., mill.

Wire Products.—Specifications are fairly good, but there is not much new business. Wire is firm at 2.40c., Cleveland. Some shading to \$2.50 per keg on nails is still reported.

Warehouse Business.—Orders for steel bars, plates and structural material are somewhat more numerous and for larger quantities than recently. This is evidently due partly to the fact that mill deliveries are slower than a few weeks ago. Prices are being well maintained.

Coke.—New demand for foundry coke is very slow, as most consumers are under contract. Prices are unchanged at \$3.50 to \$4.85, ovens, for standard Connellsville foundry coke and \$7.75, Painesville, for Ohio by-product coke. There is a moderate movement in domestic by-product coke, which a local producer quotes at \$6, Cleveland, for egg and \$5.50 for nut sizes.

Old Material.—The market has a slightly easier tone, but is holding firmly at the price levels of the past week. Attempts were made during the week to boost prices further, but met with success in only a few cases. Some No. 1 heavy melting steel was sold at as high as \$14.50 and blast furnace scrap at \$10.50. However, dealers having orders to fill have balked at paying further advances and sellers have come down at least 25c. a ton in their asking prices. Some of the mills that have been taking heavy shipments have notified their sources of supply that they will again regulate shipments, and this action is perhaps having some effect in prevent-

ing further advances in prices. Quotations are unchanged, the higher prices in the price table generally representing the dealers' market today.

Prices per gross ton delivered consumers' yards:

Basic Open-Hearth Grades		
No. 1 heavy melting steel.	\$13.25 to	\$13.75
No. 2 heavy melting steel.	12.75 to	13.00
Compressed sheet steel....	12.50 to	13.00
Light bundled sheet stamp'gs	11.50 to	11.75
Drop forge flashings.....	11.50 to	12.00
Machine shop turnings....	7.75 to	8.25
No. 1 railroad wrought....	11.50 to	12.00
No. 2 railroad wrought....	13.50 to	13.75
No. 1 busheling	10.50 to	11.00
Pipes and flues.....	9.00 to	9.50
Steel axle turnings.....	12.50 to	13.00
Acid Open-Hearth Grades		
Low phos. forging crops....	16.00 to	16.50
Low phos., billet, bloom and slab crops.....	17.00 to	17.50
Low phos. sheet bar crops.	16.50 to	17.00
Low phos. plate scrap....	15.50 to	16.00
Blast Furnace Grades		
Cast iron borings.....	9.75 to	10.00
Mixed bor'gs and short turn'gs	9.75 to	10.00
No. 2 busheling	9.75 to	10.00
Cupola Grades		
No. 1 cast.....	16.00 to	16.50
Railroad grate bars.....	11.00 to	12.00
Stove plate	12.00 to	12.50
Rails under 3 ft.....	16.75 to	17.25
Miscellaneous		
Railroad malleable	15.00 to	15.50
Rails for rolling.....	16.25 to	16.50

Youngstown Valley Mills Maintain 80 Per Cent Operating Rate

YOUNGSTOWN, Sept. 4.—Sentiment is cheerful among steel makers in this district, because orders and specifications still are sufficient to sustain an 80 per cent of capacity ingot production. The interesting feature of the market is that, while outward movement of finished products is heavy, there is enough new business to keep order books comparatively full, and, except in tin plate, there is enough business in sight to warrant the expectation that September will be another month of high rolling mill engagement. The decline in tin plate business is purely seasonal and rarely fails to develop at this time of the year, when the can makers usually have completed their orders for containers for perishable foods.

Sheet business still is heavy, new commitments being about even with completed obligations. Buyers seem disposed to lay in stocks in anticipation of the lower cash discount which all manufacturers will allow on invoices dated on and after Oct. 1, next. An important sheet manufacturer was at first disposed to refrain from going along with the movement to reduce the discount has in the past few days announced that it will cut the discount. Little business is being booked at the fourth quarter prices announced two weeks ago, and there is a fear in some quarters that more orders are being taken at prices \$2 a ton or more below fourth quarter quotations than can be produced and shipped before Oct. 1, and that this course is impairing the chances of success in the effort to secure higher prices in the final quarter of the year.

Strip business is good, and while

manufacturers have written some fourth quarter contracts at the recently announced prices of 1.90c., base, for widths of more than 6 in., 2c., base, for 3 in. to less than 6 in. and 2.20c., base, for less than 3 in., a recent bulge in orders is believed to be largely due to the fact that the large tonnage buyers have been allowed to contract for the final quarter of the year at third quarter prices. In the flat steels, therefore, the mills seem more concerned in getting enough business for economical operations than in getting better prices.

Makers are firmer in their price ideas on bars than on the flat steels and 1.90c. is as low as is being quoted in this district. On plates, outside of the dimensions and gages that compete with strips and blue annealed sheets, the market also is firm at 1.90c.

Line and seamless pipe business is good with local producers, but they admit room for improvement in other classes of tubular goods. A report that the Republic Iron & Steel Co. is negotiating for the acquisition of another company producing small tubing from strip steel finds no confirmation. The report probably grew out of the fact that this other small tube producer controls patents that would supplement those owned by the Steel & Tubes, Inc., recently acquired by the Republic company.

Sheet bars are moving well on contracts, with \$32, Youngstown, the price for this quarter and both local makers asking \$33 for fourth quarter.

Scrap prices are very firm in this area, particularly short shoveling steel turnings, which are wanted to increase pig iron production without putting on additional furnaces. To get actual deliveries, steel companies have paid \$13 to \$13.50 for this grade of blast furnace scrap.

German Export Prices Rise —Rail Orders Total 550,000 Tons

BERLIN, GERMANY, Aug. 31 (*By Radio*).—Domestic prices of pig iron and rolled steel products are unchanged for August, but the export market is strong and the Stahlwerksverband has advanced export quotations on most products. Steel bars have been increased to £6 per ton (1.30c. per lb.), the highest level in the past two years.

It is suggested by some steel sellers that a decline in export trade may result from the decision of the Railroads Corporation to advance freight rates an average of 11 per cent. The corporation has just placed an order with the Stahlwerksverband for 550,000 tons of rails and ties. Engineering plants report an increase in foreign buying.

Negotiations have been started by 65 steel casting companies to form a selling syndicate, which will allocate both domestic and export orders to its members on the basis of fixed quotas.

San Francisco

Steel Business on Coast Well Sustained—Active Fourth Quarter is Expected

SAN FRANCISCO, Sept. 1 (*By Air Mail*).—Bookings of iron and steel products on the Coast continue well sustained. Those in close touch with the situation are of the opinion that fourth quarter business will be of large proportions.

Pig Iron.—Little of importance transpired in the local market for foundry pig iron during the past week, both sales and inquiries involving spot lots. No changes in prices.

Prices per gross ton at San Francisco:

*Utah basic \$25.00 to \$26.00
 *Utah fdy., sil. 2.75 to 3.25 25.00 to 26.00
 **Indian fdy., sil. 2.75 to 3.25 24.00 to 25.00

*Delivered San Francisco.

**Duty paid, f.o.b. cars San Francisco.

Bars.—Awards of reinforcing steel bars this week were the lightest in seven weeks, totaling less than 300 tons. About 160 tons for the Deschutes River bridge in Oregon was placed with an unnamed company, as was 105 tons for the Kittitas project at Ellensburg, Wash. No new inquiries of importance have developed. Out-of-stock prices in the bay district continue weak; 1.85c. to 2c. is the range.

Plates.—No action has yet been taken on the 7200 tons for the East Bay Municipal Utility District, Oakland, distributing system. The Lacy Mfg. Co. was awarded a number of small tanks for Swift & Co.'s refining plant at Vernon, Cal., calling for 200 tons of material. Bids were opened by Tacoma, Wash., this week on 174 tons for a riveted pipe line. Plate prices are unchanged, the range being from 2.20c. to 2.30c., c.i.f.

Shapes.—Included among the larger structural shape awards of the week, which exceeded 1600 tons, were 860 tons for an apartment in Oakland, booked by the Pacific Coast Engineering Co., and 444 tons for a bridge at Nugents, Wash., placed with unnamed interests, the general contract going to the Ward Construction Co. No new inquiries of importance have developed. Prices on shapes remain firm at 2.35c., c.i.f.

Cast Iron Pipe.—An unnamed company was awarded 202 tons of 2 to 8-in. Class B pipe for Phoenix, Ariz. The inquiry of the Monterey County Water Co., Pacific Grove, Cal., calling

for 532 tons, has been withdrawn. Bids were opened this week on 320 tons of 2 to 16-in. Class B pipe for

Santa Ana, Cal., also on 147 tons of 6 to 10-in. Class C pipe for the improvement of Garnet Street, San Diego, and on 258 tons of 20 and 30-in. centrifugal pipe for San Bernardino, Cal. Pending business calls for more than 48,000 tons. Edmonds, Wash., will open bids on Sept. 4 on 1236 tons of 4 to 10-in. Class B pipe.

Canada

Railroad Equipment Orders In Large Volume Expected—Building Construction Setting a Record

TORONTO, ONT., Sept. 4.—The Canadian National Railways have announced plans for the spending of between \$10,000,000 and \$15,000,000 on equipment before the end of the year. The Canadian Pacific will also make large expenditures. During the eight months of this year Canadian steel mills have been in continual operation almost on a capacity basis, and with the new business in prospect, present activities will not cease for some time to come. Rail mills and various other departments of steel plants of this country have experienced greater activity this year than at any time since 1920. Recently published financial reports of the steel companies at Sydney, N. S., and Sault Ste. Marie, Ont., show net earnings greatly in excess of those of most years since the war, and these reports dealing with fiscal years take in only a few months of the present year's operations.

Pig Iron.—Sales for the week marked a new high level for summer business. Melters are placing spot orders in larger tonnages and some forward contracts have been closed. While individual orders range from 50 to 500 tons, average sales for the week were between 200 and 300 tons for spot delivery, and a few contracts for delivery during September and early October involved from 500 to 1000 tons. While the average daily melt in Canada is about 70 per cent, there is a feeling among leading iron and steel officials that this may jump another 10 points before the end of the year. With prices in the United States' markets gaining strength, Canadian melters and producers are looking for higher prices in the Canadian markets.

Prices per gross ton:

Delivered Toronto
 No. 1 fdy., sil. 2.25 to 2.75. \$23.10 to \$23.60
 No. 2 fdy., sil. 1.75 to 2.25. 23.10 to 23.60
 Malleable 23.10 to 23.60

Delivered Montreal
 No. 1 fdy., sil. 2.25 to 2.75. 24.50 to 25.00
 No. 2 fdy., sil. 1.75 to 2.25. 24.50 to 25.00
 Malleable 24.50 to 25.00
 Basic 23.50 to 24.00

Imported Iron, Montreal Warehouse
 Summerlee 33.50
 Carron 33.00

Structural Steel.—Canada is experiencing one of the best years in its history in building construction. It is estimated by some leading men in the industry that this country will reach

the record total of \$500,000,000 in building construction by the end of the year. Fabricators of structural steel report capacity operations. Approximately 500 tons of reinforcing bars and 2500 tons of structural steel will be required for the proposed Bayview Avenue bridge over the Don ravine in York County; 500 tons of steel and 200 tons of reinforcing bars are required for bridge and dam at Arnprior, Ont.; 1000 tons of steel is needed for proposed building in Toronto for National Life Assurance Co. of Canada. The Hamilton Bridge Co., Hamilton, Ont., has contract for 300 tons of steel for apartment house on Ottawa Street, Hamilton.

Old Material.—In keeping with improvement in other iron and steel markets, scrap sales for the week have gained. Melters are showing interest in the market both for spot and future needs, and current orders show improvement over those of former weeks this summer. Heavy melting steel and turnings are in good demand from the Hamilton district, and large tonnages are moving that way both on contract and new order account. Prices are firm, but unchanged.

Dealers' buying prices:

	Per Gross Ton	
	Toronto	Montreal
Heavy melting steel.....	\$9.00	\$7.00
Rails, scrap	10.00	9.00
No. 1 wrought.....	9.00	11.00
Machine shop turnings..	7.00	5.00
Boiler plate	7.00	6.00
Heavy axle turnings.....	7.50	6.50
Cast borings	7.50	5.00
Steel turnings.....	7.00	5.50
Wrought pipe	5.00	5.00
